SERAING, a t. of Belgium, in the province of Liege, and between three and four m. s.w. from Liege, on the right bank of the Meuse. It is a station on the railway between Namur and Liege, and is connected by a handsome suspension-bridge with the village of Jemeppe, on the left bank of the Meuse. Seraing is a place of great activity, and contains a manufactory of steam-machinery, locomotives, etc., which is probably the largest in the world. This manufactory was established by an Englishman, John Cockerill, in 1816; the king of Holland, to whose dominion Belgium then belonged, joining him in the enterprise. After the revolution of 1830, Cockerill bought up the shares belonging to the king of Holland, and the works became entirely his own. On his death in 1849, a company was formed, called *La John Cockerill Société*, to which they now belong. They occupy the former palace of the prince-bishops of Liege, which still forms their front, the extensive gardens behind it having been covered with buildings, where all the processes of machine-making are carried on. Forty or fifty tall chimneys

are clustered on this spot. The town depends on these works for its prosperity. Pop. '70, 22,000; '75, 30,193.

SERA JO. See BOSNA-SERAI.

SERAMPORE, a neat t. of British India, built in the European style, and extending a mile along the right bank of the Hooghly, 14 m. n. of Calcutta. Paper is here manufactured in large quantity. Serampore was at one time a Danish settlement, but was transferred by purchase to the British in 1845. Pop. '71, 24,440.

SERANG. See CERAM.

SERAPEUM (Gr. *serapeion* or *sarapeion*), a temple so named in honor of Serapis (q.v.), several of which are known to have existed in the ancient world. The most remarkable of these temples was that of Alexandria, which was situated s. of the canal, and outside the walls of the city, and superseded an older temple at Rhacotis. Hither was transported the statue of Dis or Pluto from Sinope by Ptolemy I., and attached to it was the celebrated Alexandrian library (q.v.). The serapeum at Memphis attained scarcely less reputation, and consisted of a group of temples dedicated to Astarte, Anubis, Imouthos or Esculapius, and Serapis. It was approached from the city of Memphis by an avenue of sphinxes, which had already become partially buried in the sands in the days of Strabo, and were discovered by M. Mariette in 1850, who, after a series of excavations, uncovered the ruins, and discovered the cemeteries of the mummified apis or bulls sacred to Ptah and Osiris at Memphis. Close to the serapeum was the apeum, or temple of the living apis, in which the bull lived, as well as the cow which had produced him. The serapeum, or, as it was called in Egyptian, the abode of *Osor-hapi*, or the Osiris-Apis, was, in fact, the sepulcher of the bull. The most remarkable part of the work, which was of great extent, was the subterranean tombs of the mummies of the apis, consisting of galleries with numerous chambers, in which the remains of these bulls had been deposited from the reign of Amenophis III. of the 18th dynasty, about 1400 B.C., till the time of the Romans. Two principal galleries contained the tombs. The second gallery, commenced in the 53d year of Psammeticus I., was on a grander scale than the first, with larger sepulchral chambers and magnificent sarcophagi of granite, measuring sometimes 12 ft. high, 15 ft. long, and weighing many tons. During the reign of the Persians, and subsequently, the chambers decreased in size, and the monuments exhibit the general decadence of the arts. The apis, considered as the incarnation of the god Ptah during life, received royal and divine honors after death; his body, or the principal portion, being embalmed, and a sepulchral tablet or tombstone placed on his sepulcher, along with other tablets of different worshippers, who adored his divinity, and dedicated them to the deceased bull. As the principal tombstone of the bull contained the dates of the king's reign in which he was born or discovered, enthroned in the apeum, and died or was buried in the serapeum, these tablets have become an important element for the chronology of the 19th and subsequent dynasties, and have aided to fix some of the hitherto doubtful points of the chronology of the period. They terminate with Ptolemy Energetes II., 177 B.C. The tablets, votive and sepulchral, amounted to about 1200, and the most remarkable are at present in the museum of the Louvre at Paris. Numerous bronze figures and other antiquities were found during the excavations, comprising costly objects of jewelry, many of which are also in the Louvre. Besides these, several Greek papyri which appear to have formerly belonged to the library or archives of the serapeum were previously known, and many have been published. These throw great light upon the constitution of the hierarchy of the serapeum, among which was a kind of order of monks, who lived within the precincts of the building, beyond which they did not go, and subsisted upon alms or the contributions of their family.—Mariette, *Serapeum de Memphis* (4to, Paris, 1856); *La Mère d'Apis* (4to, Paris, 1856); *Athen. Fran.* (4to, Paris, 1855-56); Lepsius, *Ueber den Apis-Kreis*, *Zeitsch. d. Morg. Gesell.* (8vo, Leip. 1853).

SERAPHIM (plural of *seraph*), celestial beings in attendance upon Jehovah, mentioned by Isaiah. They are similar to the cherubim (q.v.), have the human form—face, voice, two hands, and two feet—but six wings, with four of which they cover their face and feet—as a sign of reverence—while with two they fly. Nothing is more uncertain than the origin of this conception, or of the word which expresses it. Their office of singing the praises of Jehovah's greatness, and of being the swift messengers between heaven and earth, does not go far to explain it. Deserving of consideration, however, considering the close contact between Judea and Assyria and Babylon, both before and after the captivity, is a comparison between the seraphim and the winged men and beasts that have been brought to light in these last-named countries.

SERAPHINE, a keyed musical instrument in which the sounds were produced by the action of wind on free vibratory reeds. It was the precursor of the harmonium (q.v.).

SERA PIS, or SARAPIS, the Greek name of an Egyptian deity, introduced into Egypt in the time of Ptolemy I., or Soter. This monarch is said to have seen the image of a god in a dream, commanding him to remove it from the place where it was; and Sosibius, a traveler, having recognized it as existing at Sinope, Soteles and Dionysius were sent from Egypt, and brought it from Sinope to Alexandria. On its arrival it was examined

by Timotheus the interpreter and the celebrated Manetho, who called it Serapis, and appear to have identified it with Osorhapis, or Osiris united with Apis, i.e., Osiris, in his character of the Egyptian Pluto, as a deity of similar character. The figure, in fact, appears to have been one of Hades or Pluto, having at its side Cerberus, and a Dragon or snake. According to some authorities, the statue of Serapis was sent to Ptolemy II., or Philadelphus, because that monarch had relieved the city of Sinope from famine by supplying it with corn, and the statue was placed in the Serapeum, at the promontory of Rhacotis. The Serapis of the Ptolemaic period, however, was not an Egyptian, but a Greek deity, whose temple was not admitted into the precincts of Egyptian cities, and only found favor in the Greek cities founded in Egypt. It is said that 42 temples were erected under the Ptolemies and Romans to this god in Egypt. His resemblance to Osiris consisted in his chthonic or infernal character, as judge of the dead and ruler of Hades. About his nature and attributes the Greeks themselves entertained very different ideas, some considering him allied to the sun, others to Æsculapius or Hades. The god had a magnificent temple at Alexandria, to which was attached the celebrated library; another at Memphis, in the vicinity of the cemetery of the mummies of the Apis, which has been recently excavated by M. Mariette; and another temple at Canopus. From recent discoveries, it appears that he represented or was identified with the Hesiri Api, or Osorapis, the "Osirified" or "dead Apis," who was also invested with many of the attributes of Osiris, and considered, while living, to be the incarnation of the god Ptah-Socharis-Osiris, the tutelary divinity of Memphis. The worship of Serapis, introduced into Egypt by the Ptolemies, subsequently became greatly extended in Asia Minor; and his image, in alliance with that of Isis and other deities, appears on many of the coins of the imperial days of Rome. In 146 A.D. the worship of the god was introduced into the city of Rome by Antoninus Pius, and the mysteries celebrated on May 6; but they were not long after abolished by the senate; on account of their licentious character. A celebrated temple of Serapis also existed at Puteoli (Pozzuoli), near Naples, and the remains of it are still seen, and present curious geological phenomena. In Egypt itself the worship of the deity subsisted till the fall of paganism, the image at Alexandria continuing to be worshiped till destroyed, 398 A.D., by Theophilus, archbishop of that town. Busts of Serapis are found in most museums, and his head or figure engraved on certain stones was supposed to possess particular mystic virtues. His temples were oracular, the votaries consulting him by sleeping and dreaming in them; and at Alexandria the priests connected his worship with the healing art.—Plutarch, *De Isid.* s. 28; Clemens, *Orat. Adhort.* p. 21; Tacit. *Hist.* iv. c. 83, 84; Strabo, *Lib.* xvii. p. 552; Macrobius, *Saturn.* i. 7, 25; Nixon, *Dell' Edifizio di Pozzuoli detto il Tempio di Serapide* (Nap. 1773); Wilkinson, *Mann. and Cust.* iv. p. 360; Gibbon, *Decline and Fall*, c. 28.

SERASKIER, or **SERI-ASKER** (Pers. head of the army), the name given by the Turks to every gen. having the command of a separate army, and, in particular, to the commander-in-chief or minister of war. The seraskier, in the latter sense, possesses most extensive authority, being subordinate only to the sultan and grand vizier; he is selected by the monarch from among the pashas of two or three tails.

SERENADE (Ital. *serenata*), originally music performed in a calm night; hence an entertainment of music given by a lover to his mistress under her window. Sereading has been chiefly practiced in Spain and Italy. It is common among the students of the German universities to assemble at night under the window of a favorite professor, and give him a musical tribute.—A piece of music characterized by the soft repose which is supposed to be in harmony with the stillness of night, is called a serenade, or sometimes a *notturmo*.

SERES, a t. in s. European Turkey, in the eyalet of Salonica, department of Macedonia, 43 m. n.e. of the city of Salonica; pop. 30,000. It is protected by high walls, and contains a citadel, many handsome villas, fountains, several mosques and churches. It is the center of a fertile agricultural region, producing cotton and rice. It has a brisk local trade, and manufactories of cotton and woolen goods.

SERETH, an important affluent of the Danube, rises in the Austrian crownland of Galicia, runs southward through almost the whole length of Moldavia, and joins the Danube 5 m. above Galatz, after a course of 300 miles.

SERF (Lat. *servus*, a slave). A numerous class of the population of Europe known as serfs or villeins were in a state of slavery during the early middle ages. In some cases this serf population consisted of an earlier race, who had been subjugated by the conquerors; but there were also instances of persons from famine or other pressing cause selling themselves into slavery, or even surrendering themselves to churches and monasteries for the sake of the benefits to be derived from the prayers of their masters. Different as was the condition of the serf in different countries and at different periods, his position was on the whole much more favorable than that of the slave under the Roman law. He had certain acknowledged rights—and this was more particularly the case with the classes of serfs who were attached to the soil. In England, prior to the Norman conquest, a large proportion of the population were in a servile position, either as domestic slaves or as cultivators of the land. The name of *nativus*, generally applied to

the serfs, seems to indicate that they belonged to the native race, the earliest possessors of the soil. The powers of the master over his serf were very extensive, their principal limitations being, that a master who killed his serf was bound to pay a fine to the king, and that a serf deprived of his eye or tooth by his master was entitled to his liberty. The Norman conquest made little change in the position of the serf. The lowest class of serfs were the *villains in gross*, who were employed in menial household services, and were the personal property of their lords, who might sell them or export them to foreign countries; while the most numerous class, who were employed in agriculture, and attached to the soil, were called *villeins regardant*. These latter, though in some respects in a better position than the *villains in gross*, might be severed from the land, and conveyed apart from it by their lord. They were incapable of enjoying anything like a complete right to property, inasmuch as it was held, in accordance with the principles of the Roman law, that whatever the slave acquired was his *peculium*, which belonged to his lord, who might seize it at his pleasure. By a peculiarity in the usages of Britain, the condition of a child as regards freedom or servitude followed the father, and not the mother, and therefore the bastards of female villeins might be free. In France and Germany, besides the classes of serf alluded to, there were others whose servitude was of a milder description, and who were only bound to fixed duties and payments in respect of their lands.

The abolition of serfdom in western Europe was a very gradual process, various causes having combined to bring it about. The church both inveighed against the practice of keeping Christians in bondage, and practiced manumission to a large extent. In the course of time, usage greatly modified the rights and liabilities of the serf, whose position must have been considerably altered when we find him making stipulations regarding the amount of his services, and purchasing his own redemption. The towns afforded in more than one way a means of emancipation. A serf residing a year in a borough without challenge on the part of his lord, became *ipso facto* a free man; and the result of experience showed that the industry of the free laborer was quite as productive as that of the serf. At all events, serfdom died out in England without any special enactment; yet it was not wholly extinct in the latter half of the 16th c., for we find a commission issued in 1574 by queen Elizabeth, to inquire into the lands and goods of all her bondsmen and bondswomen in the counties of Cornwall, Devon, Somerset, and Gloucester, in order to compound with them for their manumission, that they might enjoy all their lands and goods as freedmen. In a few rare instances, liability to servile duties and payments in respect of lands seem to have continued down to the reign of Charles I. In Scotland, as in England, serfdom disappeared by insensible degrees; but a remarkable form of it continued to survive down to the closing years of last century. Colliers and salters were bound by the law, independent of paction, on entering to a coal-work or salt-mine, to perpetual service there; and in case of sale or alienation of the ground on which the works were situated, the right to their services passed without any express grant to the purchaser. The sons of the collier and salter could follow no occupation but that of their father, and were not at liberty to seek for employment anywhere else than in the mines to which they had been attached by birth. Statutes 15 Geo. III. c. 28 and 39 Geo. III. c. 56, restored these classes of workmen to the rights of freemen and citizens, and abolished the last remnant of slavery in the British islands.

In France, though a general edict of Louis X., in 1315, purported to enfranchise the serfs on the royal domain on payment of a composition, this measure seems never to have been carried into effect, and a limited sort of villeinage continued to exist in some places down to the revolution. In some estates in Champagne and Nivernais, the villeins, known as *gens de main morte*, were not allowed to leave their habitations, and might have been followed by their lords into any part of France for the *taille* or villein tax. In Italy, one great cause of the decline of villeinage was the necessity under which the cities and petty states found themselves to employ the peasant population for their defense, whom it became expedient to reward with enfranchisement. In the 11th and 12th centuries the number of serfs began to decrease, and villeinage seems no longer to have had an existence in Italy in the 15th century. Over a large portion of Germany the mass of the peasants had acquired their freedom before the end of the 13th c., but in some parts of the Prussian dominions a modified villeinage continued to exist until swept away by the reforms of Von Stein in the present century.

In Russia, where the feudal system never prevailed, the early condition of the peasant was not a servile one. Down to the 11th c. he could occupy any portion of the soil that he had the means of cultivating, the land being the property of all, and farmed on the purest communistic principles. The reduction of the peasantry to a state of serfdom, and their attachment to the soil, was gradually effected, and not completed till the close of the 16th century. The Russian peasant of the 19th c. was in some respects in as servile a condition as the feudal villein of the 12th c. in the w. of Europe; but there was this peculiarity attaching to his position, that while he himself was the property of his lord, the land which he cultivated belonged to himself—a consideration which greatly complicated the question of his emancipation. The emperor Alexander I. introduced various improvements in the condition of the peasantry, particularly those belonging to the crown, and in his reign serfdom was abolished in Cour-

land and Livonia. The entire abolition of villeinage has been effected by the present emperor, Alexander II., by a very sweeping measure. From March, 1863, the peasants, both husbandmen and domestics, have been made entirely free as regards their persons, while they have also obtained the perpetual usufruct of their cottages and gardens, and certain portions of land.—See, on the subject, of serfdom generally, Hallam's *State of Europe During the Middle Ages*, chap. 2.

SERGE, a kind of twilled worsted cloth of inferior quality. There is also a coarse kind of twilled silk used for lining gentlemen's coats called silk serge.

SERGEANT, JOHN, 1710–49; b. N. J.; graduated at Yale college 1729; tutor there 1732–35; ordained a Congregational minister at Deerfield, Mass., in 1735, and preached among the Indians at Skatekook and Unahktukook on the Housatonic river. He translated into the Indian language parts of the Old Testament and all of the New except Revelation. Through his labors 129 Indians were baptized.

SERGEANT, JOHN, LL.D.; 1779–1852; b. Philadelphia; graduated at Princeton college in 1795; admitted to the bar in 1801; was deputy attorney-general of Pennsylvania; counsel in many important cases in the state and U. S. supreme courts; several times member of the legislature; a member of congress for six terms between 1815 and 1842; president of the state constitutional convention in 1830; whig candidate for vice-president with Henry Clay in 1832. He took strong ground against the extension of slavery, and exerted great personal influence in the community.

SERGEANT, JONATHAN DICKINSON, 1746–93; b. N. J.; graduated at Princeton college in 1762; studied law; was a member of the continental congress 1776–77, taking his seat soon after the declaration of independence; was attorney-general of the state in 1777, which position resigning in 1780, he devoted himself to his profession in Philadelphia, in which he took high rank. He fell a victim to the yellow fever during his benevolent exertions as a member of the board of health.

SERGEANT-AT-ARMS, in the English court of chancery, is the officer who attends upon the lord chancellor with the mace; and who executes by himself or deputies various writs of process directed to him in the course of a chancery suit, such as apprehending parties who are pronounced to be in contempt of the court. A similar officer attends on each house of parliament, and arrests any person ordered by the house to be arrested.

SERGEANT-AT-ARMS (*ante*). In the U. S. senate this officer is authorized to preserve order; and, under the direction of the president of the senate, to expel from the senate-chamber; to arrest and bring before the bar of the senate; to serve processes; and to keep in custody those persons whom he may arrest under the authority of the senate. The pay of the office includes an annual salary of \$2,000, and fees for specially designated services. The duties of the sergeant-at-arms of the house of representatives are of a similar nature to those just described. In addition, he has charge of the accounts of the house with the members, disburses money, etc. His salary is \$4,320, and he has no fees.

SERGEANT-AT-LAW used to be the highest degree of barrister in the common law of England, and was called sergeant-at-law, or of the coif. The degree is of great antiquity, and formerly a barrister could only be appointed after being of sixteen years' standing, but now no particular qualification as to time is required. Formerly, also, they had exclusive audience in the court of common pleas, but that monopoly has been abolished. The proper forensic dress of a sergeant is a violet-colored robe with a scarlet hood. A sergeant is appointed by a writ or patent of the crown. The chief-justice of the common pleas recommends the barrister to the lord chancellor, who advises the crown to make the appointment. The degree of sergeant is entirely honorary, and merely gives precedence over barristers; and when he is appointed, he is rung out of the inn of court to which he belongs, and thereafter joins the brotherhood of sergeants, who form a separate community. By ancient custom, the common-law judges were always admitted to the order of sergeants before sitting as judges, but this practice was abolished in 1874. A queen's counsel (q.v.) takes precedence of all sergeants, unless these have patents of precedence, which prevent them being displaced by the queen's counsel who come after them. Sometimes one or more of the sergeants are appointed queen's sergeants.

SERGEANTS (Fr. from Lat. *serviens*, serving) are non-commissioned officers of the army and marines in the grade next above corporal. They are selected from the steadiest among the corporals, and their duties are to overlook the soldiers in barracks, and to assist the officers in all ways in the field. They also command small bodies of men as guards, escorts, etc. Every company has four sergeants, of whom the senior is the color-sergeant. A superior class are the staff-sergeants, as the quartermaster-sergeant, armorer-sergeant, hospital-sergeant; and above them all is the sergeant-major. The daily pay of a sergeant varies from 1s. 11d. in the infantry, to 2s. 11d. in the horse-artillery. For his privileges, see **NON-COMMISSIONED OFFICERS**. In ancient times the rank of sergeant was considerably more exalted. In the 12th c. the sergeants were gentlemen of less than knightly rank, serving on horseback. Later, the sergeants-at-arms were the royal body-guard of gentlemen armed *cap-à-pie*.

SERGEANTRY, GRAND (Fr. *sergenterie*, from Lat. *servicius*), a tenure by which lands were held in feudal times in England. After the conquest the forfeited lands were parceled out by William to his adherents on condition of the performance of services of a military character. The military tenants of the crown were, however, of two descriptions; some held merely *per servitium militare*, by knight-service; others held *per sergentiam*, by grand sergeantry, a higher tenure, which involved attendance on the king not merely in war, but in his court at the three festivals of the year, and at other times when summoned. Although the word baron, in its more extended sense, was applied to both classes of crown tenants, yet it was only those holding by grand sergeantry whose tenure was said to be *per baroniam*. In its earliest stage the distinction between the greater nobility and lesser nobility or gentry in England was, that the former held by grand sergeantry, and the latter by knight-service only. In theory, lands held by sergeantry could not be alienated or divided; but practically this came to be often done, and by this means tenures by sergeantry became gradually extinct before the abolition of military holding. Considerable misapprehension on the part of Dugdale and later writers has arisen from a double use of the word *servicius*, or sergeant, which is sometimes applied to a tenant either by grand sergeantry or knight-service who had not taken on himself the obligations attendant on knighthood.

The term petty sergeantry was applied to a species of socage tenure in which the services stipulated for bore some relation to war, but were not required to be executed personally by the tenant, or to be performed to the person of the king, as the payment of rent in spurs or arrows.

SERGIPE, a maritime province of Brazil, bounded on the n. by the Sao Francisco, which separates it from Alagoas; on the w. and s. by Bahia; and on the e. by the Atlantic. According to the most recent statements, this province is the smallest in the empire. Area, 15,000 sq. m.; pop. 177,000. The shores are low and sandy, the interior mountainous. The e. part is fertile, well-wooded, and produces sugar and tobacco; the western districts are devoted principally to the rearing of cattle. The chief town is Sergipe d'el Rey, at the mouth of the chief river—the Vasa Barris—and with a pop. stated at 9,000.

SERIES, CHEMICAL. See HOMOLOGY and BOILING OF LIQUIDS.

SERIES, MATHEMATICAL. See ARITHMETICAL PROGRESSION, GEOMETRICAL PROGRESSION, and PROGRESSION, *ante*.

SERINAGUR, SIRINUGGER, or CASHMERE, the capital of the valley of Cashmere, stands on both sides of the Jhelum, which is here 100 yds. wide, 170 m. n.e. of Lahore. It is quaint and picturesque-looking almost beyond conception. The streets, or rather narrow lanes, lead to the river, and the houses, five and six stories high, are built of wood. Not a single straight line is to be seen. The houses overhang the river, and lean toward each other above the lanes in various stages of dilapidation. Communication between the two quarters is kept up by means of a number of rustic wooden bridges, built on enormous piles of timber. Shawls are an important article of manufacture (see CASHMERE). The manufacture of articles of papier-mâché, the designs of which are far in advance of the workmanship, and engraving on stone and metal, are also important branches of industry. The vicinity of the city, with its border of towering mountains, is exceedingly beautiful. The numerous lakes, connected with the town and river by canals, recall Venice to the traveler. The most notable public structures are the Jumna Musjid or "Great Mosque," capable, according to native estimate, of containing 60,000 persons, the mosque of Shah Hamedan, a royal tomb, and the governor's residence. Near the e. end of the city lies the dal or lake of Serinagur, about 5 m. long, and $2\frac{1}{2}$ broad. It is a lovely and tranquil sheet of water, was formerly a choice retreat of the Mogul emperors, the remains of whose pleasure-grounds and palaces are still visible on its margin, the most celebrated being the Shalimar, of polished black marble. Pop. in '71, 132,681; in the early part of the present c., it is stated to have been from 150,000 to 200,000.—*Captain Knight's Diary of a Pedestrian in Cashmere and Thibet* (1863).

SERINGAPATAM (properly, *Shri Ranga Patanam*, city of Vishnu), a decayed city of southern India, built on an island in the channel of the Kaveri, nine m. n.e. of Maisur. The island, three m. long, and one m. broad, has a wretched appearance, and the town itself is ill-built, ill-ventilated, and ugly. The fort, about three-quarters of a m. broad, is surrounded by strong walls of stone, and contains the palace of Tipu Sahib (q.v.). In the days of its highest prosperity, Seringapatam is said to have contained 300,000 inhabitants; in 1800, it contained 31,895, and in '71 it contained 10,594. Hyder Ali (q.v.) made it the seat of his government in 1765. It was besieged by lord Cornwallis in 1791, and again in 1792. On the last occasion, the terms dictated by the commander of the British to Tipu, the son and successor of Hyder Ali, were very severe. A British army appeared before the walls again in 1799; and on May 3 of that year the fort was stormed, and Tipu slain in the vicinity of his own palace.

SEROUS FLUIDS. This term is applied by chemists and physicians to various fluids occurring in the animal body. They are arranged by Gorup-Besanez, one of the highest authorities on physiological chemistry, under three heads: 1. Those which are contained

in the serous sacs of the body, as the cerebro-spinal fluid, the pericardial fluid, the peritoneal fluid, the pleural fluid, the fluid of the tunica vaginalis testis, and the synovial fluid. 2. The tears and the fluids existing in the eyeball, the amniotic fluid, and transudations into the tissue of organs. 3. Morbid or excessive transudations, such as dropsical fluids, the fluids occurring in hydatids, and in blebs and vesicles on the skin, and transudations from the blood in the intestinal capillaries, as in cases of intestinal catarrh, cholera, or dysentery.

All these fluids bear a close resemblance to one another, both in their physical and chemical characters. In so far as relates to their physical characters they are usually clear and transparent, colorless or slightly yellow, of a slight saline, mawkish taste, and exhibiting an alkaline reaction with test-paper. They possess no special formal or histological elements, but on a microscopic examination blood-corpuscles, cells of various kinds, molecular granules, and epithelium may occasionally be observed in them. The ordinary chemical constituents of these fluids are water, fibrine (occasionally), albumen, the fats, animal soaps, cholesterine, extractive matters, urea (occasionally), the same inorganic salts which are found in the serum of the blood, and the same gases as occur in the blood. As rare constituents, and only occurring in disease, may be mentioned sugar, the biliary acids, salts of lactic and succinic acids, creatinine, mucine, etc. The following analysis of four of these fluids will serve to give a good idea of their composition:

	Plasma of the Blood.	Peritoneal Dropsy.	Hydro- thorax.	Dysenteric Transudation.
Water.....	901.51	946.0	936.0	958.6
Solid Constituents.....	98.49	54.0	64.0	41.4
Fibrine.....	8.06	0.6
Albumen.....	81.92	23.0	52.8	15.0
Extractive Matters.....	13.0	3.0	14.6
Inorganic Salts.....	8.51	8.0	7.4	11.8

SERMONÉTA, MICHELANGELO CAETANI, Duke of; b. Italy, 1804. of a noble and ancient family. He early showed great talent as an artist, and as a literary man. He was an earnest student of Dante, and has published several essays on the *Divina Commedia*, as well as a series of illustrations, of originality and delicacy of execution. Since 1865 Sermoneta has been blind. In 1870 he was president of the commission which announced to Victor Emmanuel the result of the Roman *plebiscite*.

SEROUS MEMBRANES. There are seven of these membranes in the human body, three being median and single, while two are double and lateral. They are the arachnoid, the pericardium, and the peritoneum, with the two pleuræ and tunicae vaginales testis. Thus they are connected, with the obvious view of facilitating motion and affording general protection, with all the most important organs in the body. They are all closed sacs, with one exception, and a reference to the articles PERICARDIUM, PERITONEUM, and PLEURÆ, will at once show the reader that each sac or continuous membrane consists of two portions—a parietal one, which lines the walls of the cavity, and a visceral, or reflected one, which forms an almost complete coating or investment for the viscera contained in the cavity. The interior of the sac is filled during life with a halitus or vapor, which after death condenses into a serous fluid. With regard to their structure it is sufficient to state that they consist essentially of (1) epithelium; (2) basement membrane; (3) a stratum of areolar or cellular tissue, which constitutes the chief thickness of the membrane, and is the constituent on which its physical properties are mainly dependent. This layer is more liable to variation than the others, and one of the most common alterations is an augmentation of the yellow fibrous element, by which an increased elasticity is given to the membrane, which is thus better adapted for distention, and for a subsequent return to its original bulk. The situations in which this augmentation is found are, as Dr. Brinton (*Cycloædia of Anatomy and Physiology*, vol. iv. p. 524) has pointed out, in exact conformity with this view: in the peritoneum, which lines the anterior abdominal wall, and covers the bladder, it attains its maximum; in the detached folds of the mesentery, in the costal pleuræ, and in the suspensory ligament of the liver it is still very prominent; while on the posterior wall of the belly, and in serous membranes covering the heart, liver, etc., it is almost absent.

The following are the most important of the morbid changes to which these membranes are liable. One of the most frequent of the morbid appearances seen in these structures is the presence of an excess of serous fluid in their cavity. This condition occurs in deaths from various diseases, and in general the serous membrane only shares in a dropsy which is common to other structures, and especially affects the areolar or cellular issue. When general anasarca, or dropsy of the cellular tissue, has existed for a long time, more or less dropsical effusion is usually found in the pleuræ and peritoneum. The inflammation of these structures is sufficiently described in the articles PERICARDITIS, PERITONITIS, and PLEURISY. Tubercle is seldom primarily deposited in these membranes, although it is not uncommon after other organs have been implicated. Cancer and ossification of the serous membranes are rare affections, but cysts of various kinds, some of which are of parasitic origin, are often found.

Synovial membranes present many points of similarity to serous membranes; as, however, they also present several points of difference, they will be briefly noticed in a special article.

SERPENT, a powerful bass musical wind instrument, consisting of a tube of wood covered with leather, furnished with a mouth-piece like a trombone, ventages, and keys, and twisted into a serpentine form, whence its name. Its compass is said to be from B₂ below the bass staff to C in the third space of the treble clef, including every tone and

semitone— but the highest octave does not sound well with ordinary players. When unskillfully played, it exhibits the most startling inequalities of

tone, in consequence of there being three notes  much more power-

ful than the rest. The serpent is in B₂, and therefore music for it must be written a whole tone above the real sounds. The serpent was invented by a French priest at Auxerre in 1590, and while its principal use has been in military music, it has also been employed in the orchestra to re-enforce the basses. As an orchestral, and even as a military instrument, the serpent is far less manageable than the ophicleide (q.v.), which has nearly superseded it. It is still much used in the music of the Roman Catholic church.

SERPENTARIA. See ARISTOLOCHIA.

SERPENT-CHARMING, an art which has been practiced in Egypt and throughout the east from remote antiquity, and which forms the profession of persons who employ it for their own gain, and for the amusement of others. In India, and partly if not entirely in other countries, this profession is hereditary.

There are several allusions to serpent-charming in the Old Testament: see Psalm lviii. 4, 5; Eccles. x. 11; Jer. viii. 17. It is mentioned also by some of the ancient classics, as Pliny and Lucan.

Serpent-charmers usually ascribe their power over serpents to some constitutional peculiarity, and represent themselves as perfectly safe from injury even if bitten by them. To confirm this, they are accustomed, in their exhibitions, to exasperate the serpents, and allow themselves to be bitten, so that blood flows freely. But it has been fully ascertained that the serpents which they carry with them, and produce on these occasions, although of the most venomous kinds, have been at least deprived of their poison-fangs, and to prevent new ones from growing, a portion of the maxillary bone is often if not always taken out; in some cases, it appears that the poison-glands themselves are removed by excision and cautery.

So much, however, being set aside as of the nature of a mere juggler's trick, much still remains which is interesting, and in which there is unquestionable reality. The serpent-charmers of the east have a power beyond other men of knowing when a serpent is concealed anywhere, long practice having probably enabled them to distinguish the musky smell which serpents very generally emit, even when it is too faint to attract the attention of others. They are therefore sometimes employed to remove serpents from gardens and the vicinity of houses. In this, as in their exhibitions, they pretend to use spells. What power the tones of their voice may exert is of course uncertain; but they accompany their words with whistling, and make use also of various musical instruments, the sound of which certainly has great power over serpents. When they issue from their holes, the serpent-charmer fearlessly catches them, by pinning them to the ground by means of a forked stick. But one of the first things he does afterward is to knock out or extract the poison-fangs.

In the exhibitions of serpent-charmers, the creatures are often made to twine round the bodies of the performers. They also erect themselves partially from the ground, and in this posture they perform strange movements to the sound of a pipe, on which the serpent-charmer plays. It appears also that he exerts a very remarkable influence over them by his eye, for even before any musical sound has been employed, he governs and commands them by merely fixing his gaze upon them.

In 1850, a party of Arab serpent-charmers visited London, where exhibitions took place similar to those which are common in the east.

SERPENTINE, a mineral composed of silica and magnesia in almost equal proportions, with about 13 to 15 per cent of water, and a little protoxide of iron. Serpentine is generally massive; very rarely crystallized in rectangular prisms. COMMON SERPENTINE sometimes occurs as a rock. It is unctuous to the touch, and soft enough to be scratched by calcareous spar. It is not easily broken, but can be cut without much difficulty. It is generally green, black, or red; the color sometimes uniform, sometimes spotted, clouded, or veined. It receives its name from the serpent-like form which the veins often assume. It is cut and turned into ornaments of various kinds. PRECIOUS

SERPENTINE or NOBLE SERPENTINE is of a rich dark-green color, hard enough to receive a good polish, translucent; and sometimes contains imbedded garnets, which form red spots, and much add to its beauty. It is a rare mineral. It occurs at Baireuth in Germany, in Corsica, at Portsoy in Banffshire, in the Shetland islands, etc. It is generally found along with foliated limestone, in beds under gneiss, mica-slate, etc., or in common serpentine. The ancient Romans used it for pillars and for many ornamental purposes; and vases, boxes, etc., are still made of it, and much prized. The ancients ascribed to it imaginary medicinal virtues.

Serpentine belongs to the metamorphic rocks. It occurs as an irregularly overlying mass in the Lizard district of Cornwall, as a dike at Portsoy, and as nodular aggregations in the granite of Aberdeenshire. It is generally associated with the granitoid, igneous, or metamorphic rocks, though it is occasionally found as a member of the trappean series. Trap dikes, in passing through or coming into contact with limestone, not unfrequently convert it into serpentine, or fill it with lines or masses of serpentine.

SERPENTS. *Ophidia*, an order of reptiles, which is in general simply characterized as having a very elongated body and no external limbs. The links, however, which unite saurians with serpents are very numerous; the limbs of many saurians being partially wanting, and little more than rudimentary; whilst rudimentary limbs are found by anatomical examination in many serpents, and the rudimentary hinder limbs of some, as boas, appear externally in the form of hooks or claws. See BOA.

The body and tail are covered with scales, the head often with plates. The vertebrae and ribs are extremely numerous, a pair of ribs being attached to each vertebra throughout the whole length of the body. Some serpents have more than 300 pair of ribs. The ribs not only serve to give form to the body, and aid in respiration, but are also organs of locomotion. There is no breast-bone (*sternum*) for the small end of the ribs to be attached to, as in other vertebrate animals, but each rib is joined by a slender cartilage and a set of short muscles to one of the scales of the abdomen. A serpent moves by means of the ribs and of these scales, which take hold on the surface over which it passes, and in this way it can glide—often very rapidly—along the ground, or on the branches of trees; and many species climb trees with great facility, gliding up them as if on level ground. Most—if not all—of the species are also capable of elevating a great portion of the body from the ground; and many of those which live among the branches of trees hold their place firmly by means even of a few scales near the tail, and freely extend the greater portion of the body in the air. On a perfectly smooth surface, as that of glass, a serpent is quite helpless, and has no power of locomotion.

The vertebrae of serpents are so formed as to admit of great pliancy of the body, which is capable of being coiled up, with the head in the center of the coil, and some serpents have the power of throwing themselves to some distance from this coiled position. The vertebrae are articulated by perfect ball-and-socket joints, the anterior extremity of each being rounded into a smooth and polished ball, which fits exactly into a hemispherical cup in the next; but there are processes in each vertebra which prevent any motion except from side to side, so that serpents are quite incapable of the vertical undulations so often represented in prints. The ribs are also attached to the vertebrae by ball-and-socket joints.

Cuvier divided serpents into three sections, the first—of which the common blind-worm (q.v.) or slow-worm of Britain is an example—consisting of those which have the skull, teeth, and tongue similar to those of saurians, and in which the eye has three lids, and there are vestiges of bones of anterior limbs; the second, which Cuvier calls true serpents, having no vestiges of such bones, the eye destitute of lids, and the bones of the head so formed that the mouth and throat are capable of very great dilation; the third, which he calls naked serpents, containing only the genus *cacilia* (q.v.), now known, notwithstanding its form, to belong really to the batrachians or amphibia.

The serpents of Cuvier's first section have been conjoined with some of the nearly allied saurians, more or less furnished with external limbs, under the name *saurophidia*, by Mr. Gray. They are connected with the true serpents by the families *amphisbeniada* and *typhlopsida*, which nearly agree with them in the structure of the head and mouth, but want the third eyelid—some of the *typhlopsida*, indeed, having the eye itself merely rudimentary—and, like the true serpents, have no vestige of breast-bone or shoulder. These, with all the creatures included in this section, are, in so far as is known, perfectly harmless. They live chiefly on insects and other very small animals.

The true serpents live on larger prey, which they swallow entire, some of them—as the boas—crushing it by constriction in the coil of their muscular body. The prey of a serpent is often thicker than the serpent itself, and to admit of its being swallowed, the throat and body are very dilatable. The bones of the head are adapted to the necessity of a great expansion of the mouth and dilation of the throat. The bones composing the upper jaw are loosely joined together by ligaments; and even the arches of the palate are movable. The two halves of the lower jaw are connected by a ligament, so loose and elastic that they are capable of separation to a great extent; and the mastoid and tympanic bones, which connect the lower jaw and the skull, are lengthened out into pedicels, allowing an extraordinary power of dilation. Serpents, however, sometimes

seize prey too big for them to swallow, and die in the attempt, their teeth being so formed as to render it difficult to reject by the mouth what has once got into the throat.

The teeth of the true serpents are simple, and directed backward. In the non-venomous kinds there are four rows on the upper part of the mouth, two rows on the jaws, and two on the palate; each division of the lower jaw is also armed with a single row. In vipers, rattlesnakes, and other venomous serpents, there are no teeth on the upper jaw except the poison-fangs; the palatal teeth, however, forming two rows as in the non-venomous kinds, the arrangement of teeth in the lower jaw being also the same. Venomous serpents do not, in fact, need the same array of teeth as the non-venomous; depending rather on the power of their venom for their prey, which they suddenly wound, and then wait till it is dead. The poison-fangs are long in comparison with the other teeth; they are two in number, firmly fixed into a movable bone; when not in use they are laid flat on the roof of the mouth, covered by a kind of sheath formed by the mucous membrane of the palate; when the animal is irritated, and about to assail its enemy or its prey, they stand out like two lancets from the upper jaw. They move with the bone into which they are fixed; and the bone and muscles are so arranged that the opening of the mouth brings them into the position for use. There is above them, and toward the back of the head, a large gland for the elaboration of the poison, which is forced through them by the action of the muscles, each fang being tubular. The tube of the fang is formed, not as by a hollowing of it, but as by a bending of it upon itself, and is situated in front. The opening near the fang's point is a narrow longitudinal fissure. The poison-fangs are very liable to be destroyed, and the germs of new ones are generally found behind them, ready to grow and supply their place.

It is sometimes stated as a distinction between venomous and non-venomous serpents that the former have only two rows of teeth on the upper part of the mouth while the latter have four. This rule must not, however, be accepted without qualification. In the marine serpents (*hydride*), there are rows of maxillary teeth behind the poison-fangs; and some of the venomous land-serpents, as the longars or rock snakes of the East Indies, which, however, are not among the most venomous, have some smaller teeth in the jaw-bones behind the poison-fangs.

The venom of serpents differs very much in its deadly power in different species. The bite of some causes the death of a human being in a few minutes, so that no creatures are more formidable; that of others proves fatal after the lapse of hours; while the bite of others, such as the common viper, is seldom fatal, although causing great pain and many unpleasant consequences. "I have carefully examined all the evidence on record," says Mr. Buckland, "as regards the most efficacious internal remedy that can be given in such cases, and have come to the conclusion that nothing is so good as ammonia" (*Curiosities of Natural History*). The same writer also recommends brandy or other stimulating drinks to be taken in large quantities. But it is of the utmost importance to suck the wound as soon as possible after it has been inflicted, and no danger is to be apprehended in doing so if there be no scratch or sore about the mouth, for the poison, so deadly when it mixes with the blood, is quite innocuous when taken into the stomach.

Many antidotes to the poison of serpents are in vogue in different countries, most of them, if not all, utterly unworthy of regard. Dr. Fayrer believes that the bite of the cobra, elaps, and Russell's viper is almost certain death. Tight ligatures above the bitten part to stop the circulation of the poisoned blood; excision; cauterizing with live coal, red-hot iron, or gunpowder: application of ammonia, and repeated doses of alcohol, are the chief remedies to be tried; but they must be resorted to *immediately* after the patient has been bitten.

The peculiarities of the lungs of serpents are noticed in the article REPTILES. The heart is placed very far back in the body. The intestines have a great absorbent power, and the feces consist only of the most indigestible portions of the prey in an extremely desiccated state; the members of the animal which has been swallowed being still often distinguishable, and hair, scales, and the like remaining unchanged.

The tongue of serpents is forked and is often thrust out of the mouth. It is vulgarly regarded as the *sting*, but serpents have no sting, their only weapons being the fangs already noticed. The only sound which serpents emit is that of hissing.

Serpents are either strictly oviparous or they are ovoviviparous. The non-venomous serpents are generally oviparous; the venomous, ovoviviparous. The eggs of those which lay eggs are generally deposited in a long string, connected by a kind of viscous substance, in some heap of decaying vegetable matter, the mother paying no further heed to them. But some serpents coil themselves around their eggs and hatch them; and it would even seem that the habits of the same species differ as to this in different climates. The eggs of serpents are not quite devoid of calcareous covering, but have so little that their integument is soft and pliable.

It has been often alleged that vipers and other serpents when alarmed, swallow their young, and eject them again after reaching a place of safety. There still remains some doubt on this curious question, which has been much discussed; and it is not improbable that the alleged proofs of it from living young ones issuing out of the body of the parent when crushed, are to be accounted for by the ovoviviparous mode of generation.

It seems probable that serpents do not possess the senses of taste or smell in great

perfection. The ear has no external opening, and no tympanum, nor is it certain that their hearing is acute, but they are remarkably sensible of the power of music, of which serpent-charmers avail themselves, both to bring them from their holes and to control them. See **SERPENT-CHARMING**. A European gentleman, residing in one of the mountainous parts of India, found that his flute attracted them in such numbers to his house that he was under the necessity of ceasing to play it. Their eyes are small, and are protected from the dangers to which they might otherwise be exposed, by a transparent integument connected with the skin, and which comes away with the skin when the old skin is cast off, as is the case at least once a year.

The colors of serpents are very various, and often very beautiful. As a general rule, but not without exceptions, the venomous species are of darker and more uniform color than the non-venomous. The aversion and horror with which serpents are so generally regarded are, of course, due to the dangerous character of so many of them and the difficulty of observing and avoiding them.

Serpents are used as food by some savage tribes. They are capable of being tamed, and some of the non-venomous species have frequently been so, and have been found useful in killing mice, rats, and other such vermin.

Serpents abound chiefly in tropical climates, although some are found in northern countries, as in Scandinavia. The British species were, until recently, supposed to be only three in number—the blindworm (one of the *saurophidia*) and two true serpents, the common snake and the viper, the last alone (the adder) being venomous. Much interest has been excited by the discovery in England of the *coronella levis* (see **CORONELLA**), a harmless snake, common in some parts of the continent of Europe. Much curious information occurs in Buckland's *Curiosities of Natural History*.

SERPUKOV, a very ancient Russian t., 56 m. s. of Moscow, close to the left bank of the Oka. It contains a cathedral, and is defended by a kreml or citadel. There are upward of 50 factories, of which those engaged in the manufacture of cotton prints, sail-cloth, woolen goods, and leather are of importance. Pop. '67, 14,172.

SERPULA, a genus of annelida, of the order *tubicolæ*, forming and inhabiting a calcareous tube, like that of mollusks, and therefore described in old works on conchology. Indeed, the shell of a serpula is not always easily distinguished from that of mollusks of the genus *vermetus*, although the inhabitants are extremely different; but the shell of *vermetus* has a regular spire at the apex, which is not found in that of any serpula. The serpulæ attach their shells to rocks, shells, etc. in the sea. The shell is variously contorted, and some of the species live in groups, with the shells intertwined. The wider end of the shell is open, and from it the animal protrudes its head and gills, which expand as beautiful fan-like tufts. They are in general exquisitely colored, and serpulæ are among the most interesting and beautiful creatures that can be placed in an aquarium. On the slightest alarm, they disappear completely into the tube, which then is closed by an operculum curiously framed as an appendage to the gills. Several species of serpula are common on the British coasts, but the largest are found in tropical seas, and are among the many lovely objects to be seen in looking down through clear still water on coral reefs.

SERRANO Y DOMINGUEZ, FRANCISCO, Duke de la Torre; b. Spain, 1810; served in the war of independence. He was a member of the junta which overthrew Espartero in 1843, and after the restoration of Maria Christina, helped Narvaez overthrow Olazaga. His influence over queen Isabella after her marriage, in 1846, was so great as to cause serious dissensions between her and the king consort. He overthrew the Sotomayor ministry, which attempted his downfall, but the Salamanca ministry, though supported by him, was overthrown by public disapproval. Serrano now became a liberal, was appointed capt.gen. of Granada, was exiled in 1854 for complicity in an insurrection at Sagossa, came back during the revolution in that year, and supported the O'Donnell-Espartero cabinet. In the dissensions between them he took part with O'Donnell, and as capt.gen. of New Castile acted with O'Donnell in the *coup d'état* of 1856. He was ambassador to Paris in 1857, and capt.gen. of Madrid in 1865. Three years later he was associated with Prim and Topete at the head of the revolution, Prim taking the ministry of war, Serrano becoming commander-in-chief of the army and president of the council, and Topete minister of marine. He was presently elected regent, and remained in that office till Amadeo accepted the throne. In 1874 he became president of the executive power in Spain.

SERRAVALLE, a city of northern Italy, in Venetia, on the river Aleschio, 35 m. n. of Venice. It is situated in a valley, and was formerly fortified. The cathedral, S. Andrea, is very ancient. Pop. 5,400.

SERTO'RIUS, Q., one of the ablest Roman commanders in the later ages of the republic, was a native of Nursia, in the country of the Sabines, and began his military career in Gaul. He fought, 165 B.C., in the disastrous battle on the Rhone in which the Roman proconsul, Q. Servilius Cæpio, was defeated by the Cimbri and Teutones, and took part in the splendid victory at Aquæ Sextiæ (mod. Aix), 102 B.C., where Marius annihilated the same barbarians. On the breaking out of the sanguinary struggle between the party of the nobles under Sulla (q.v.), and the popular party headed by Marius (q.v.) (88 B.C.),

he espoused the cause of the latter. Morally, he was much superior to the military adventurers of his time; and the impression we have of him from Plutarch's picturesque biography is that of a valiant, resolute, honest, and stubborn Roman, such as was commoner in the 3d than in the 5th c. of the republic. None of the Marian generals held out so long or so successfully as he against the victorious oligarchy. He fought in conjunction with Cinna the battle at the Colline gate, which placed Rome at the mercy of the Marians, but he had no hand in the bloody massacres that followed. What we do hear of him is to his credit. He got his own troops together, and slew 4,000 of the ruffianly slaves whom Marius was permitting to plunder and ravish at will through the city. On the return of Sulla from the east (83 B.C.), Sertorius withdrew into Etruria, but finding it impossible to act in concert with the other military leaders of his party, he went to Spain, where he continued the struggle in an independent fashion. At first he was not very successful, and found it advisable to embark for Mauritania. After several adventures, in the course of which he once passed through the strait of Gibraltar, and fell in with some sailors who had visited the Atlantic islands, and whose descriptions so wrought upon his imagination, that he "was seized with a strong desire to dwell in the islands, and to live in quiet, free from tyranny and never ending wars"—(Plutarch)—he returned to the peninsula, at the invitation of the Lusitanians, got together an army composed of natives, Libyans, and Romans, and after a time became the virtual monarch of the whole country. During 80–76 B.C., he was victorious over all his opponents, nor was it until the arrival (76 B.C.), of young Pompey ("Pompey the great"), that he found an opponent worthy to cope with him; and even Pompey was scarcely yet his equal in military skill. Sertorius drove Pompey over the Iberus (Ebro) with heavy loss; nor was the campaign of the following year (75 B.C.), more favorable, for though Sertorius's subordinates were twice beaten, Pompey himself had no success, and was forced to write urgent letters to the senate for re-enforcements. The campaigns of the next two years were unimportant, except in so far as they show us the gradual operation of that miserable jealousy and envy of Sertorius that brought about his ruin. Perperna, and other Roman officers of the Marian party, who had fled to him in 77 B.C., when Sulla became triumphant at home, and who seem to have been a set of base adventurers, secretly stirred up the Spaniards against him, and when that artifice did not prove so successful as was hoped, they conspired against his life, and assassinated him in his own tent, 72 B.C., under circumstances of shameful perfidy. With Sertorius the Marian or popular cause sunk, until it was revived and attained final success in the person of Julius Cæsar (q.v.). Plutarch has written Sertorius's life, and Cornille has made it the subject of a tragedy.

SERTULARIA, a genus of zoophytes (*anthozoa*), plant-like and branched, horny, tubular, filled with a semifluid organic pulp, the polype cells in two rows on the branches, the polypes hydra-like. The species are numerous, and some are common on the British coasts, attached to stones, shells, sea-weeds, etc. The sertulariæ are very beautiful.

SERUM. See BLOOD.

SERVAL, *Felis serval* or *leopardus serval*, one of the smaller *felidæ*, a native of South Africa, the *boschkatte*, or bush-cat, of the Cape Colony. It is about 2 ft. in length, exclusive of the tail. The serval is a beautiful animal, yellowish with black spots, the lower parts white with black spots. The fur of the serval is in great request, and is known to furriers as that of the *tiger cat*. The serval is one of the mildest and most docile of the *felidæ*.

SERVANT. See MASTER AND SERVANT.

SERVETUS, MICHAEL, or, in his native Spanish, MIGUEL SERVEDE, a notable and unfortunate speculator in theology, was b. at Villanueva, in Aragon, in 1509. At the age of nineteen he quitted Spain, and commenced the study of law at Toulouse, which he soon abandoned to devote himself with ardor to the knotty points of the reformation doctrines. In 1530 he went to Basel to hear Ecclampadius, and thence to Strasburg, where Bucer and Capito taught. His daring denial of the doctrine of the Trinity frightened or angered these divines to such a degree that they denounced him as "a wicked and cursed Spaniard." Servetus appealed from their judgment to that of the public in his *De Trinitatis Erroribus Lib. VII.* (Haguenau, 1531; modern edition, Nuremberg, 1791), and his *Dialogues* (Haguenau, 1532); but the public thought as little of his teaching as the theologians; and to avoid the odium which it had occasioned, he changed his name to Michael de Villanueva, and fled to Paris; where he studied medicine under Sylvius and Fernel, and took his degree as a physician with honors. Servetus seems to have possessed a kind of penetrating, if also rash and restless intellect, which enabled him to hit truth occasionally in his flighty researches, or, at least, to make happy guesses in the right direction. Thus, for example, he had an idea (see M. Flourens in the *Journal des Savans*, April, 1854) of the doctrine of the circulation of the blood. He attacked Galen and the faculty with his customary violence in a treatise on syrups (*Syruporum Universa Ratio*, Paris, 1537; Lyons, 1546). About this time he made the acquaintance of Calvin, with whom he had several conferences or private disputations, the result of which was a public challenge; but Servetus, after assenting to the arrange-

ments, decamped, afraid probably, and not without reason, that his precipitate imperious way of thinking did not fit him for discussing with so cool, wary, and merciless a logician as the Genevese reformer; afraid, too, perhaps, of being unceremoniously handed over to the authorities for heresy! After living successively for some time at Lyons, Charlien, and Avignon, and supporting himself by writing for the booksellers, he found an asylum in the palace of Pierre Paulmier, archbishop of Vienne, in 1541, where he remained for some years, and wrote his famous *Christianismi Restitutio*, first published in 1553. The work has been twice reprinted, first by Dr. Meade of London (incomplete), and again by Murr. at Nuremberg, in 1790. Its celebrity is due more to the fact that it sealed the fate of its author, than to its intrinsic merits, the ideas being obscure, and the style incorrect. After its publication, Servetus wished to go to Italy, by way of Switzerland, but in passing through Geneva, was arrested and imprisoned at the instigation of Calvin (q.v.). After a long and complicated judicial procedure, Servetus was condemned to be burned, and the sentence was carried into execution, Oct. 27, 1553—the hapless heretic expiring in agonies. The fate of Servetus, after all the palliations that can be offered are weighed, remains a dark stain on the memory of Calvin. See Willis's *Servetus and Calvin* (1877).

SERVIA (Turk. *Syryp*), a principality formerly included within the limits of European Turkey, but independent since 1878. It is bounded on the n. by Austria; on the e. by Wallachia and Bulgaria; on the s. by Roumelia and Bosnia; and on the w. by Bosnia. Area about 18,816 sq.m.; pop. '78, 1,642,068. The country is mountainous and densely wooded. From the interior, numerous chains proceed northward, forming massive barriers both on the eastern and western frontiers, and sloping pretty steeply toward the swampy plains along the Save and the Danube. In the extreme n.e. near Orsova they reach the very edge of the Danube, and along with the Eastern Carpathians on the opposite shore, imprison the great river within a wall of rock, known as the *Iron Gate* of the Danube. The highest of these chains is the Rudnik mountains (gathered into a knotty group about the center of the state), which in the Great Schuraz attains an elevation of 3,400 feet. The *Schumadia*, or forest, extends southward from Belgrade for 60 miles. Beautiful landscapes are everywhere to be seen. The principal rivers (Serb. *ijeka*) flowing through the country are the Morava and Timok, affluents of the Danube; and the Kolubara, an affluent of the Save, which itself falls into the Danube at Belgrade. The climate is temperate and salubrious, but somewhat cold in the higher regions. The soil in the valleys and level districts is fertile, and equally fitted for the rearing of cattle, the favorite occupation of the people, and the production of corn and wine; but not more than $\frac{1}{4}$ th of the land is under tillage, and fully $\frac{3}{10}$ ths is forest or wilderness. Oak is the most common wood, but chestnuts and fruit-trees of all sorts abound, especially pears, of which there are whole forests in some places. The mountains are believed to be rich in copper and silver, but mining is almost unknown, and manufacturing industry is in the most backward condition.

Constitution, Internal Administration, etc.—The constitution now in force dates from 1869.—The land is divided into 17 *oeruzia*, or circles (Turk. *Kazas*); each circle has a prefect and a court of the first instance, and sends a deputy to the *seubschitina*, or national parliament. The circles are subdivided into 53 *srezi*, or arrondissements, and these again into 1152 *obschtine* or parishes, each of which has a justice of peace court. The civil legislature of Servia is modeled after that of Austria. The government comprises a president, who is also minister of foreign affairs, together with ministers of the interior, of justice, of finances, of public worship, of war, and of public works.—The military force is composed of a small body of regulars, under 6,000 men, including cavalry and artillery, and an immense national guard of about 115,000 men, which can easily be raised to 150,000, for every Serb carries arms, and is trained to military habits. In 1867 the Turkish government, at the instance of friendly powers, surrendered to Servia the fortresses previously held by it, the chief of which was Belgrade.

Religion, Education, and Finance.—The inhabitants nearly all belong to the Greek church, but are independent of the patriarch of Constantinople. Ecclesiastical affairs are managed by a metropolitan, whose seat is at Belgrade, and by the three bishops of Uzitz, Shabatz, and Timok. For the few who acknowledge the authority of the pope and the Latin church, there is a bishop *in part, infid.*, but who resides at Dincobir in Austrian Slavonia. Servia, according to recent estimates, had 298 churches, 651 parishes, and 652 priests, besides 38 cloisters. It also possessed upward of 300 educational institutions, including several gymnasia, a lyceum for philosophical and juristic studies, a theological college, an artillery school, a school of agriculture, and 300 elementary schools for boys, and 13 for girls. These schools are not under the control of the clergy, and education is consequently making rapid progress. In 1875-76, the revenue of the country amounted to 35,256,692 piasters, and the expenses to 34,806,884. Servia has no public debt.

Character.—The Servians are distinguished for the vigor of their frame, their personal valor, love of freedom, and glowing poetical spirit. Their manners and mode of life are exceedingly picturesque, and strongly prepossess a stranger in their favor. They rank among the most gifted and promising members of the Slavic family.

History.—In the earliest times of which we have record, Servia was inhabited by

Thracian or Illyrian races—the Bessi, Scordisci, Dardanii, and Triballi. Shortly before Christ it was subjugated by the Romans, and under the name of *Masia Superior* formed part of the province of Illyricum, whose fortunes it shared during the vicissitudes of the empire. Overrun successively by the Huns, Ostrogoths, Longobards, etc., it reverted to the Byzantine rulers about the middle of the 6th c., but was wrested from them by the Avars in the 7th c., to oppose whom the emperor Heraclius, about 636, invoked the aid of the Serbs from eastern Galicia. The Serbs obeyed the call, and in less than two years drove the Avars from the land, over which they themselves spread in great numbers, their settlements extending from the Morava as far w. as the Dalmatian Alps and the Adriatic, and from the Save as far s. as the Balkan and lake Sentari. About the middle of the 9th c. they were converted to Christianity by missionaries sent by the emperor Basilus, but this did not in the least abate their natural ardor for battle, and for nearly 200 years they were almost constantly at war with the neighboring Bulgarians—the inveterate enemies of their Byzantine liege lord. In 1043, however, Stephen Bogislav expelled the imperial governors; and during 1050–80 his son, Michael, made himself wholly independent, took the title of king of Serbia, and procured the recognition of his royal dignity from pope Gregory VII. For the next hundred years the Serbs had to fight hard to maintain their independence, but the struggle terminated in their favor; and in 1165 Stephen Nemanja founded a dynasty which lasted for two centuries, during which period the kingdom of Serbia attained the acme of its power and prosperity. Under Stephen Dushan (1336–56), the greatest monarch of the Nemanja dynasty, it embraced the whole of Macedonia, Albania, Thessaly, northern Greece, and Bulgaria. The progress of the Turkish arms, however, was fatal to its welfare, and in 1389 king Lazar fell in the disastrous battle of Kossovopolje. Sultan Bajazet divided the country between Lazar's son, Stephen, and Lazar's son-in-law, Vuk Brankovitch, but compelled both to pay tribute, and to follow him in war. Gradually the Serbs sunk more and more under the Turkish yoke, until, in 1459, Serbia was thoroughly subjugated by the sultan Mahmud. It was uniformly the theater of the bloody wars between Hungary and Turkey, and frequently suffered the uttermost horrors of devastation. Prince Eugene's brilliant successes for a moment flashed a ray of hope into the miserable hearts of the long-suffering Serbs, and by the treaty of Passarowitz (1718) a considerable portion of the country was made over to Austria; but in 1739 it reverted to Turkey, and for the next 60 years the cruelty and oppressions of the pashas and their janizaries surpasses all belief. At length the unhappy people could endure the tyranny of their foreign masters no longer, and in 1801 an insurrection broke out, headed by George Czerny (q.v.), which, by the help of Russia, ended in the triumph of the patriots, and in the election of Czerny by the people as prince of Serbia. The invasion of Russia by France, however, left the Serbs at the mercy of their late rulers, and the war again broke out. Czerny was forced to flee, and the tyranny of the Turks became more ferocious than ever. Again the people flew to arms under the leadership of Milosch Obrenovitch, and were a second time successful in winning back their liberties. Milosch was chosen prince of Serbia in 1815. Compelled to abdicate in 1839, he was, in 1858, restored to his former dignity, which was made hereditary in his family. In July, 1876, Serbia, excited by the rebellion in Herzegovina, declared war against Turkey, and was joined by Montenegro. The Servians, generally unsuccessful, in spite of the help of numerous Russian volunteers, were totally defeated at Alexinatz in September; in November an armistice was concluded; and in Mar., 1877, the conditions of peace were signed. Next month war was declared by Russia against Turkey. The sympathies of the principality were undoubted; but Serbia did not venture again to take the field against Turkey till the fate of the war had been practically decided by the fall of the Turkish stronghold of Plevna in Dec., 1877. The recognition of Serbia's independence and an important increase of its territory to the southward, demanded by Russia at the close of the war, were agreed to by the Berlin congress in 1878.

Language and Literature.—The Serbian language, called also the Illyrian, belongs to one of the four great divisions of the Slavic family, and is more nearly allied to Russian than to Polish or Bohemian. It is distinguished from the other members of its division by the predominance of vowels, and consequently by its soft, melodious resonance. This character it owes in part to the influence of the Italian and Greek languages—the former influence being the result of commercial intercourse; the latter of community of religious belief. The long domination of the Turks has also left unmistakable traces on the Serbian tongue; nevertheless it has on the whole preserved a genuine Slavic character, possessing along with the other members of that family a complete system of declension and conjugation, along with a free syntax. The old classical meters are imitated with facility in it. It is spoken (in the three dialects—Herzegovic, Razavic, and Syrmic) by more than 7,000,000 people, of whom 4,500,000 are under Austrian, 2,500,000 under Turkish, and a few under Russian authority.

After their conversion to Christianity, the Serbs, like the Russians, employed the old Slavic church language in writing, but in two different styles, one called the church style, and the other the chancery or legal style. The most important monument of the latter is the "law-book," published by king Stephen Dushan, though the oldest extant specimens go back as far as the 11th century. The literary remains of the former are more numerous, and embrace ecclesiastical, devotional, and historical works, for the

most part composed by the clergy and the monks. With George Brankovitch (b. 1645, d. 1711), who wrote a *History of Servia* from the origin of the nation to his own time, this first or mediæval period in Servian literature closes. The second or modern period is characterized in its commencement by an effort to raise the spoken language of the Serbs to the dignity of a written language. The consequence was, for a considerable time, the literary language of Servia was a chaos of confusion, writers not appearing able to make up their minds which dialect to use, and spoiling their productions by a barbarous mixture of both; and it was not till Vuk Stephanovitch published his *Grammar of the Servian Language* (1814), and his *Songs of the Servian People*, that the victory of the reformers was complete. Since then the spoken language of Servia has also become the language of literature. These Servian popular songs or ballads constitute by far the finest part of Servian literature. The picturesque scenery of the land, and the free solitary life led in the mountain ranges, kindled the imagination of the people, and awoke the voice of song at an early period. Some of the ballads—now so widely known throughout Christendom by means of translation—go back to a period anterior to the appearance of the Turks in Europe. In a wonderful manner they combine the rude strength, spirit, and *naïveté* characteristic of the ballad everywhere, with oriental fire and Greek plasticity. They are invariably unrhymed, but preserve at the same time a rhythmic measure. See Kapper's *Völklieder der Serbien* (2 vols. Leip. 1852); and Bowring's *Servian Popular Poetry* (Lond. 1827); and Owen Meredith's *Serbske Pesme* (Lond. 1861); the last, however, a book of doubtful honesty. Among the poets who acquired distinction in the first part of the century, and have employed the vernacular, the most important is Lueyan Muschiki (died 1837), archbishop of Carlovitz, whose *Poems* appeared at Pesth in 1838. Of recent or living Servian poets, the most gifted are Branko Raditshevitz and Jovan Ilitz. As yet, science has made little progress. In another branch of the Servian people—the so-called Illyrians, especially the Dalmatians, who profess the Roman Catholic faith—literature received an earlier and more artistic development than among the Serbs of the Greek church. In the 12th c. a priest of Ducla (Diocelea) wrote a chronicle, first in Slavic, and afterward in Latin, fragments of which are still extant. During the 13th and 14th centuries devotional works in the vernacular were numerous, toward the end of the 15th c. the republic of Ragusa (Slav. Dubrovnik) obtained the name of the "Illyrian Athens" on account of the brilliant success with which it cultivated literature, art, and science. Epic, lyric, and dramatic poetry, history, and jurisprudence are all admirably represented. The list of its poets is particularly large. Toward the end of the 18th c. literary activity abated among the southern or Illyrian Serbs, but at the same time began to increase in the n., especially in Croatia and Hungary.—See Rüstitz, *Ueber die Serb. Literatur* (Berl. 1853); and, in English, Talvi's *Historical View of the Languages and Literature of the Slavic Nations* (New York, 1850); as also Schafarik's *Geschichte der Südslavischen Literatur* (1864), and Novakovitch's *Istoriya srpske Književnosti* (Belgrade, 1867). There are numerous grammars and dictionaries.

SERVICE, *Pyrus domestica* (see PYRUS), the *Sorbus domestica* of many botanists, a tree of 50 or 60 ft. in height, with pinnated leaves, which are downy beneath, and their leaflets serrated upward, and small white flowers in panicles, a rare native of England, found also in various parts of Europe, the w. of Asia, and the n. of Africa, and cultivated for its fruit, which is obovate, and about an inch in length, resembling a small pear, but pleasant only in a doughy and over-ripened state, like the medlar. It is more cultivated in Italy, Germany, and France than in Britain. The tree is of very slow growth, and attains a great age. The timber is valuable, very heavy, fine grained, and susceptible of a high polish, possessing a strength and durability which particularly adapt it for some purposes of the machine-maker. It is used also for making mathematical rulers, etc.—The name **WILD SERVICE** is given to an allied species, *pyrus torminalis*, also called the **SORB**, a common native of the middle and s. of England, and of the middle and s. of Europe—a small tree, with a spotted fruit, considerably larger than that of the common hawthorn, which, like the fruit of the true service, becomes mellowed and pleasant by keeping, and is regularly brought to the market in many parts of Europe. Large quantities are brought to London from Hertfordshire. The dried fruit is used in some places as a cure for diarrhea. The wood is highly valued. It is hard and tough, yellowish-white, with brownish-red and dark brown streaks.

SERVICE AND WORK is the name usually given to an action brought by a workman who has done work to order, or on request, or has been engaged for a specific time.

SERVICE-BERRY. See JUNE-BERRY.

SERVICE OF HEIRS is a proceeding in the law of Scotland by which the heir of a deceased owner of land has his relationship recognized and declared, and his feudal title to the land completed.

SERVITUDE, a name borrowed by the law of Scotland from the Roman law, to denote that kind of right or interest which a person often has in land of which he is not the owner, as a right to cut turf, etc. Servitudes are divided into predial and personal. A predial servitude is a right constituted over one subject or tenement by the owner of another subject or tenement; while a personal servitude is constituted over a subject in favor of a person without reference to possession of property. The only kind of per-

sonal servitude is life-rent or usufruct. The predial servitudes are those usually referred to under the head of servitude. Such a servitude being constituted in respect of the ownership of property, passes to third parties with such ownership. The tenement over which the servitude exists is called the servient tenement, and the other is called the dominant tenement. Predial servitudes are again subdivided into rural and urban, according as they affect land or houses. The usual rural servitudes are those of passage or road, pasture, feal and divot, aqueduct, thirlage, etc. Passage or road is the right which a person has to walk or drive to his house over another's land. Pasture is the right to send cattle to graze on another's lands. Feal and divot is the right to cut turfs or peats on another's land. Aqueduct is the right to have a stream of water conveyed through another's lands. Thirlage is the right to have other people's corn sent to one's mill to be ground. The urban servitudes are stillicide, light, *oneris ferendi*, etc. Stillicide is the right to have the rain from one's roof drop on another's land or house. Light is the right to prevent another from building so as to obstruct the windows of one's house. *Oneris ferendi* is the right of the owner of the flat above to have his flat supported by the flat beneath.

SERVIVS TULLIVS. See **ROME**.

SERVVS SERVORVM DEI (Lat., Servant of the Servants of God), a form of subscription adopted by the Roman pontiffs from the days of pope Gregory the great, by whom, according to his biographer, Paul the deacon, it was assumed as a practical rebuke of the ambitious assumption of the title of "Ecumenical (or universal) patriarch," by John, surnamed Nestenes, or the faster, the contemporary patriarch of Constantinople. Gregory is said, indeed, by Paul to have been the first Christian bishop by whom this humble form was employed. This, however, is certainly a mistake, the same designation having been frequently used by bishops before the time of Gregory. Gregory was probably the first of the bishops of Rome to adopt it as a distinctive title. It is found in all the letters of Gregory which Venerable Bede has preserved in his history.

SES'AME GRASS (*Tripsacum dactyloides*), a species of grass of large size found on the Atlantic coast of the United States and in the gulf states. The stem is thick, and the leaves broad, somewhat resembling the sugar cane. It is generally considered too coarse for fodder.

SESAMOID BONES are small bones met with in the substance of the tendons of muscles in the neighborhood of certain joints. They derive their name from the Gr. *sēsamō*, a kind of Indian grain, which they were supposed to resemble. In the human subject, the patella is the best example; and besides it they are commonly met with only on the palmar aspect of the joint which unites the metacarpal bone with the first phalanx, and in the corresponding position in the toe, there being two in each position, and their object being to increase the leverage of the short flexor muscles of the thumb and toe. They are much more abundant in the great majority of mammals than they are in man.

SESAMUM, a genus of plants of the natural order *bignoniaceæ*, suborder *pedaliaceæ*, a suborder characterized by wingless seeds, and placentæ with woody lobes attached to the inner wall of the fruit. The calyx of sesamum is five-parted; the corolla bell-shaped and five-parted, the lowest lobe prolonged; the stamens four, two longer than the others, and a rudimentary fifth stamen; the capsule is oblong, almost four-celled, two-valved, many-seeded. The species are natives of India and Africa, and are annual plants, covered with hairs, their flowers solitary in the axils of the leaves, on very short stalks. They are so similar as to be sometimes reckoned mere varieties of one species, *S. Indicum*. The sweet oleaginous seeds are used in some countries, as in Central Africa, for making a kind of hasty-pudding. In Egypt they are eaten strewed on cakes. The bland fixed oil of sesamum, obtained from the seeds by expression, is used as an article of food, and for medicinal purposes, like olive oil. It keeps long without becoming rancid. It is much used by the women of Egypt as a cosmetic. For the sake chiefly of its oil, sesamum is much cultivated in India, China, Japan, and in many tropical and sub-tropical countries, and has been cultivated from very ancient times. It is too tender for the climate of England. The oil-cake, mixed with honey and preserved citron, is an oriental luxury. The leaves of sesamum abound in a gummy substance, which they readily impart to water, making a rich bland mucilage, which is used in the southern parts of the United States as a demulcent drink. Sesamum is sometimes called *tilseed*.

SESBA'NIA. See **DIUNCEÆ**.

SESHA is, in Hindu mythology, the great king of the serpent race, on which Vishn'u reclines on the primeval waters. He has a thousand heads, which also serve as a canopy to Vishn'u; and he upholds the world, which rests on one of his heads. His crest is ornamented with jewels. Coiled up, Sessa is the emblem of eternity. He is often also called *Vāsuki* or *Ananta*, the eternal.

SESOSTRIS, the Greek name of a celebrated Egyptian monarch, who is supposed to have conquered all Asia and Ethiopia. His name has passed into the series of those conquerors who have almost achieved universal empire. According to the Greek legendary history, when Sesostris mounted the throne of Egypt, he began his scheme of conquest, first dividing Egypt itself into 36 nomes, placing his brother as regent, and laying on him injunctions not to assume the diadem, or interfere with the royal harem. Sesostris

then marched at the head of a large army, and invaded Libya, Arabia, Asia, penetrating further e. than Darius. Advancing through Asia Minor, he invaded Europe, and subdued Thrace and Scythia, leaving a colony at Colchis on his return. In the s. he subdued Ethiopia, and placing a fleet on the Red sea, conquered the adjacent isles, and extended his dominions to India itself. On his return to Egypt from his northern campaigns, his brother, who had disobeyed his instructions, endeavored to destroy him by inviting him to a banquet at Daphnæ, and treacherously attempting to burn him and his whole family by firing the house. Sesostris threw two of his children into the fire, and making a bridge of their burning bodies, escaped. Sesostris, in his triumphs, dragged his captives attached to the wheels of his chariot. The captives were employed on the public works, the enlargement of the Hephestæum at Memphis (q.v.), and other temples, and in the construction of canals and mounds. Memorials of his reign, it was said, were left as steles or tablets in the conquered countries; and Herodotus saw some in Palestine, which are supposed to be the tablets of Ramesses II. (see **RAMESSES**), still existing in the pass of Nahr-el-Kelb, or the Lycus, and the sculptured rock at Nymphæ, near Smyrna. Sesostris is said to have grown infirm and blind after a reign of 33 years, and to have ended his days by his own hand.

Not only does the greatest confusion and difficulty about identifying this monarch exist among modern, but also in the classical authors. Herodotus places his reign long before that of Cheops of the 4th dynasty. Dicaearchus makes him rule 3712 B.C., and is followed by Aristotle and other authors. Bunsen supposes that there were more than one monarch of this name, and that one was Tosorthos, of the 3d dynasty; another, Sesortesen II., of the 12th dynasty. Lepsius conjectures that he is the Sethos I. and Ramesses II. of the 19th dynasty. But the exploits of Sesostris seem to be a conglomeration of the conquests of the kings of the 18th and 19th dynasties, especially the Thothmes and Ramesses (q.v.), who extended the empire of Egypt far to the w. and east. No one monarch of the Egyptian monarchy can represent Sesostris. Herodotus, ii. c. 102; Diodorus, i. c. 55-57; Val. Flaccus, v. 419; Strabo, xvi.; Wilkinson, *Mann. and Cust.* i. 99-106; ii. 70; iii. 190; Lepsius, *Einleit.* s. 278; Bunsen, *Aegyptens Stelle*, book ii. 85, 86, 312-324.

SESQUIAL'TERA, one of the compound stops of the organ, composed of either five, four, three, or two ranks of open metal-pipes tuned in thirds, fifths, and octaves to the diapason.

SESSA, a city of southern Italy, province of Caserta, about 38 m. n.n.w. of Naples. Pop. '72, 6,138. It has a fine cathedral, a theological seminary and colleges. There are manufactories of woolen cloth. The neighboring soil is fertile. Sessa is a very ancient city; it was the capital city of the Aruncii, was afterward colonized by the Romans in 314 A.U.C., and was very flourishing under the Roman empire. It was raised to a duchy in the middle ages.

SESSION, COURT OF. See COURT OF SESSION.

SESSIONS. See JUSTICE OF THE PEACE, QUARTER SESSIONS.

SESTER'TIUS, a Roman coin, was the fourth part of the *denarius* (q.v.), and thus contained at first $2\frac{1}{2}$ *asses* or *libre*. The name is an abbreviation of the Latin *semis-tertius*, which was their mode of expressing $2\frac{1}{2}$; and their custom was, to derive the names of all their coins from the foundation of their money-system, the *as* (q.v.). The symbols for it were indifferently IIS or IIS, the former being only a modification of the latter, which expresses two units, and S for the additional half-unit (*semis*). In the Latin classics the phrase *sestertius-nummus*, or merely *nummus*, is frequently employed to denote this coin. When the *denarius* (q.v.) was made to contain 16 *asses*, the relation between it and the sestertius was preserved, and the latter from that time contained 4 *asses*, though the name, which was now no longer significant, was preserved. Up till the time of Augustus, when the relation of the *denarius* to the *as* was changed, the sestertius was worth 2 pence $\frac{1}{2}$ farthing sterling, but after this period it was reduced to 1 penny $3\frac{1}{2}$ farthings sterling. The sum of 1000 sestertii was called *sestertium* (after Augustus, = £7 16s. 3d.), which was the "money of account" (never a "coin") used in the reckoning of large sums of money.

SESTO FIORENTINO, a t. in Italy, province of Florence, containing several parishes, the largest with a pop. of 6,000. Within its limits is the parish of Colonnata, containing a celebrated manufactory of porcelain.

SESTRI LEVANTÉ, a sea-port of n. Italy, 26 m. e.s.e. of Genoa. It is situated on a little bay near the mouth of the Gromolo, and has five foreign consulates. Its church of the nativity has some valuable paintings. Pop. 2,300.

SESTRI PONENTÉ, a t. of n. Italy, 4 m. w. of Genoa, stands on the high-road which runs along the sea-coast. There is a large government factory of tobacco. Pop. 9,500.

SETA'RIA. See MILLET.

SETHE. See COAL-FISH.

SETHITES, the name given to an obscure Gnostic sect of the 2d c., allied to the Ophites, or worshipers of the serpent; they belonged to that class of religionists who, in evolving what they regarded as their system, approached paganism. Accepting the

Christian mode of thought and its terminology, they utterly disregarded the great facts of Scripture history, maintaining that Seth reappeared in the person of the Messiah, and affirming that they possessed books written by him.—See Neander's *Kirchengeschichte* (Bohn's translation, vol. ii. p. 115).

SET-OFF, in law, the amount of debt due to a defendant from a plaintiff which the former is allowed to interpose as a defense to all or part of the plaintiff's demand. No such right existed at common law, but the statutes of 2 and 8 George II. applied to the colonies and have been re-enacted with some changes in all the states. The plea of set-off must describe the debt with as much precision as if it were a declaration. An unliquidated or indefinite claim for damages cannot be put forward as set-off, and there must be *mutuality* between the two claims. Thus if A sues B for a debt, B cannot introduce as set-off a debt due him by A, C, and D, *jointly*. But an exception exists in the case of a trustee or *cestui que trust*. At common law where there are continued dealings or accounts, debit and credit, only the balance may be sued for; and hence set-off applies only to independent, disconnected debts. Where the defendant's claim exceeds that of the plaintiff he may recover the excess; but where the plaintiff is the assignee of him against whom the defendant has a claim, this does not hold. Equitable set-off is in many respects broader than that at law.

SETON, in surgery, is an artificially produced sinus or channel, through which some substance—e.g., a skein of cotton or silk, or a long flat piece of india-rubber or gutta-percha—is passed so as to excite suppuration, and to keep the artificially formed openings patent. (The term is, however, very often employed to designate the inserted material.) Setons are established in the subcutaneous tissue of the body (1) as counter-irritants, or (2) to act as a drain on the system at large, or (3) to excite inflammation and adhesion. For the purposes of counter-irritation, setons are usually inserted in the neighborhood of the affected parts; but when intended to act as a drain on the system at large—e.g., in threatened head-affections—the nape of the neck is the part always selected. The operation is very simple. A longitudinal fold of skin over the spines of the cervical vertebrae is raised by the fingers from the deeper structures, and is transfixed by the seton-needle rather obliquely, so that one of the openings shall be rather more dependent than the other. The needle must pass somewhat deeply through the subcutaneous tissue, as, if it passed immediately beneath the skin, the latter would probably slough over the whole track of the wound. The inserted material should be smeared with oil, and may be allowed to remain undisturbed for four or five days, till there is a free discharge of matter, after which a fresh portion should be drawn daily through the wound.

For the purpose of exciting local inflammation and adhesion (which is a result of the inflammation), setons are employed in the treatment of hydrocele, enlarged burse, ranula, bronchocele, ununited fractures, etc. In the two last-named cases, their use is, however, not unattended by danger.

The word *seton* is derived from the Latin *seta*, a hair, because hairs were originally employed as the inserted material. Indeed, at the present day, it is the custom of many of the nomadic tribes of Central Asia to insert a hair into the heels of their prisoners, which lances them to such an extent as to prevent their escape.

SETON, ELIZABETH ANN (BAYLEY), 1774–1821; b. New York; accompanied her husband to Italy in 1803, and on his death at Pisa, returned to New York; became a Roman Catholic in 1805; taught a school in Baltimore, 1805–08. Having received a large amount from the rev. Samuel Cooper, and being joined by her sisters-in-law, Harriet and Cecilia Seton, she established the sisters of charity, the first in the United States. They assumed the religious habit and opened a convent at Emmittsburg, Md., in 1809. In 1812 the sisterhood numbered 20 members, and mother Seton was chosen superior-general. In 1817 the institution was incorporated by the legislature of Maryland. At the death of the superior there were 50 members. She was a woman of great zeal and efficiency.

SETON HALL COLLEGE, South Orange, Essex co., N. J., a Roman Catholic institution; organized in 1856. Its course of study extends through a term of seven years. It has a fine situation, excellent buildings, and a library of 6,000 volumes. Professors, '78, 11; students, 82. Rev. James H. Corrigan, A. M., president.

SETT, in Scotch law, was used to denote the constitution of a burgh, whether founded on immemorial usage or modeled by the convention of royal burghs (q.v.).

SETTE COMMUNI DI VICENZA, a district consisting of seven communes or parishes in the neighborhood of Vicenza, the language and population of which are plainly Teutonic, and have maintained themselves pure and unmixed in the midst of a Latin people from the days of the Roman republic. The inhabitants are believed by antiquaries to be descendants of the remnant of the Cimbric army which was defeated with great slaughter by Marius, and are supposed to have escaped to the mountains, and there fixed a permanent settlement. Their language is perfectly intelligible to any German scholar. Specimens of this dialect, and of a similarly isolated Teutonic dialect which is found near Verona, are given by Adelung in the *Mithridates*, ii. p. 215.

SETTER, a kind of dog which derives its name from its habit of *setting* or crouching when it perceives the scent of game, instead of standing, like the pointer. Setters, however, are now trained to adopt the pointer's mode of standing while marking game. The setter was originally used to assist in the capture of game by the net. It is supposed to derive its origin from a mixture of the pointer and the spaniel. It is larger than the spaniel; its hair is less smooth than that of the pointer, and has more of the waved character of that of the spaniel, to which there is a resemblance also in the ears. The tail is bushy. There are several breeds of the setter. The general color of the *English setter* is a white ground, with large spots or blotches of liver-color or red. The *Irish setter* has larger legs in proportion to the size of the body. The *Scotch or Gordon setter* is of a rich black-and-tan color. The *Russian setter* is covered with woolly fur, much matted together. Each of these breeds has its peculiar merits. All setters have the soles of the feet well covered with hair, so that they can bear hard work on rough ground. They soon become exhausted, however, unless they have access to water. The setter is much employed by sportsmen. It is one of the most affectionate, gentle, and intelligent of dogs.

SETTLE, ELKANAH, was b. at Dunstable, in the year 1648. He completed his education at Trinity college, Oxford, which he left without taking a degree, and repaired to London, to seek his subsistence by literature. In 1671 he made something of a hit by the production of his tragedy of *Cambyses*; and the earl of Rochester and others, wishing to annoy and insult the great Dryden, loudly hailed in him the superior genius of the two. Through the influence of Rochester, to his next tragedy, *The Empress of Morocco*, the unwonted honor was accorded of being played at Whitehall by the lords and ladies of the court, and in this way a great run was secured for it when it came before the general public. In the insolence of success, the author printed along with it a preface, in which Dryden was severely assailed. Solely in virtue of the quarrel thus engendered is Settle now remembered. In his great satire, *Absalom and Achitophel*, Dryden scourged him with his scorn, so that in some sort he survives for us, if only as a shrieking ghost. Having no real strength of talent, he speedily relapsed into obscurity. The post of poet-laureate for the city he had obtained, and he continued to retain. By writing in this capacity verses for city pageants and festivities, and producing pieces to be acted in the Looths of Bartholomew fair, the some-time rival of Dryden was fain to eke out a wretched subsistence. In his destitute age, he was admitted to the Charterhouse, where in 1723 he died, his works having predeceased him.

SETTLED ESTATE, in English law, means an estate held by some tenant for life, under conditions more or less strict, defined by the deed.

SETTLEMENT, in English law, is used in two senses. In one case it means the mode of securing property on married parties, so as to regulate the succession in the event of the death of either, or it may regulate the succession of parties not married. In poor-law matters it means that kind of right which a pauper has to support by the parish by reason of his being born there, or of his renting a tenement or acquiring estate, etc. It often happens that a person becomes chargeable, that is, is entitled to be relieved by a parish in which he has no settlement, and the relieving parish can forthwith remove him to his parish of settlement. See REMOVAL OF PAUPERS. In Scotland, settlement, besides the above meanings, also means the general will or disposition by which one regulates the disposition of his property after death.

SETTLEMENT, in law (*ante*). As to settlement of paupers, see POOR LAWS (*ante*). Marriage settlements may be made before and in consideration of the marriage, or after it. They vest the property in trustees, generally for the use of the husband and wife during their joint lives, then for the use of the survivor of them, and then for the children by the marriage. Marriage is a valuable consideration at law, and will support an agreement by a third person, though a stranger, to make a settlement upon the husband and wife and their issue. A marriage settlement made without consideration, after marriage, settling the husband's property upon the wife and children, is good against subsequent creditors, but void as to creditors at the time of settlement. The ordinary powers in marriage settlements of real estate are powers of sale and exchange, of leasing and managing, and of raising portions and jointuring.

SETUBAL (frequently and erroneously called by the English St. UBE's) is an important sea-port city of Portugal, in the province of Estremadura, 20 m. s.e. of Lisbon. It stands on the n. side of the bay of Setubal, which forms a magnificent harbor, though the entrance to it is obstructed by sandbanks. The harbor is furnished with a light-house and with broad and handsome quays, and is protected by five forts; but the valley in which the town itself stands is completely commanded by the heights in the vicinity. The town owes its importance chiefly to its trade in the muscadel and white wines, in sea-salt, oranges, lemons, and cork bark, but fishing is also carried on with considerable activity. Setubal is the old Roman *Cetobriga*. In 1755 it was visited by an earthquake, from which it suffered severely. Pop. 17,000.

SEVASTOPOL, or, as it is sometimes written, SEBASTOPOL (*Sebastopolis*, the "august city"), a Russian sea port, fortress, and arsenal in the Crimea, in the government of Taurida. It is situated near the s.w. extremity of the Crimea, on the southern side of the

magnificent harbor or roadstead of Sevastopol, one of the finest natural harbors in the world. This harbor is an inlet of the Black sea, stretching inland for about $4\frac{1}{2}$ m. from w. to e., about half a mile wide at the entrance, but immediately opening out to the width of a mile, with an average width of about half a mile up to the eastern end. It is sheltered on the n. and s. by lofty limestone ridges shutting it completely in, with a depth of water varying from 3 to 11 fathoms, and sufficient in several places to allow ships of the largest size to lie close to the shore. At the eastern end, under the heights of Lukermann, the river Tchernaya enters the harbor through low marshy ground. The South bay, or Dockyard harbor, as it is also called, extending about one and a half miles from n. to s., forms the harbor proper of Sevastopol; and between it and Quarantine bay, occupying rather more than half the peninsula thus formed, is built the chief portion of the town of Sevastopol, on ground sloping irregularly upward. The town, previous to its destruction in the siege of 1854-55, was well and substantially built of stone, with lines of streets running from n. to s., and smaller ones intersecting them at right angles, containing several handsome public edifices. The docks, constructed for the Russian government by col. Upton, an English civil engineer, were among the most important works at Sevastopol; the dock-basin, docks, and quays were formed in the most substantial way, being partly cut in the solid rock, and lined with cement, partly built of limestone and granite. From the dockyard creek, ships were admitted into the dock basin by means of three locks, the bottom of the docks being above the sea level, and the basin was supplied with water by a canal some 12 m. in length from the Tchernaya above Inkermann—itself a work of no inconsiderable magnitude. For the defense of town and harbor from attack by sea, several forts were erected. These forts were works of immense strength, built of limestone faced with granite, on which artillery was found to make but little impression; they mounted a very large number of guns, and by their cross-fire completely protected every spot accessible to a hostile fleet. On the land side, with the exception of a slight loop-holed wall extending partially round the western side, the town, previous to the siege, was entirely undefended; but the earthworks and fortifications then successively extemporized by the genius of gen. Todleben, which for so many months kept the armies of France and England at bay, and of which the Malakoff and the Redan were the most formidable, are now of historic fame.

The siege of Sevastopol by the allied English and French armies will rank among the most famous sieges in history; it lasted for 11 months, from Oct., 1854, to Sept., 1855; the place sustained repeated bombardments, the first of which took place Oct. 17, 1854; and the capture of the Malakoff and Redan, on Sept. 8, 1855, at length forced the Russians to evacuate it, and retire to the n. side. The town was completely ruined; the docks and forts still standing were blown up by French and English engineers, and by the treaty of Paris (1856) were not to be restored; but the restrictions were removed by the abrogation of the neutrality of the Black sea by the conference of London (1871). Before the siege the population of Sevastopol, including the garrison, amounted to about 40,000. Since, the town has been partially rebuilt, but the population in 1875 was only 20,000. Sevastopol was intended to be the station of the Russian Black sea fleet, and as such to form a standing menace to Turkey; during the siege the fleet was almost entirely destroyed, many of the ships having been sunk by the Russians across the entrance of the harbor by way of defense. The great disadvantage of Sevastopol as a naval station arises from the ravages of the *teredo navalis*, which soon render wooden vessels unseaworthy. Sevastopol was founded on the site of a small Tartar village called *Akhtiar*, immediately after the Russian conquest of the Crimea in 1783, under the orders of the empress Catharine II. The promontory on which Sevastopol stands is a spot of considerable classical and historical interest. Here, perhaps on the site now occupied by the Greek convent of St. George, w. of Balaklava, stood the temple of the Tauric Artemis, in which, according to the legend, Iphigenia, daughter of Agamemnon, was priestess. It later times the promontory was colonized by Greeks from Heraclea, in Asia Minor, and became known as the Heracleotic Chersonese. Two cities, successively built a few miles apart on the sea-coast to the w. of Sevastopol, have left remains existing to the present day. In after times the Chersonesus fell into the power of the Genoese, who established their headquarters at Balaklava, where the remains of the "Genoese castles" on the heights still bear witness to their rule. See *History of the Russian War* (W. and R. Chambers).

SEVEN, frequently used as a mystical and symbolical number in the Bible, as well as among the principal nations of antiquity (the Persians, Indians, Egyptians, Greeks, Romans, etc.). The reason for the preference of this number for sacred use has been found in its consisting of *three*—the number of the sides of a triangle—and *four*—the sides of a square, these being the simplest rectilinear figures;—or in other equally vague circumstances. The real reason, however, seems to be astronomical, or rather astrological, viz., the observation of the seven planets and the phases of the moon—changing every seventh day. (See **WEEK**.) As instances of the use of this number in the Old Testament, we find the creation completed in seven days, wherefore the seventh day was kept sacred; every seventh year was sabbatical, and the seven times seventh year ushered in the jubel-year. The three *regalim*, or pilgrim festivals (passah, festival of weeks, and tabernacles), lasted seven days; and between the first and second of these feasts were counted seven weeks. The first day of the seventh month was a

"holy convocation." The Levitical purifications lasted seven days, and the same space of time was allotted to the celebration of weddings and the mourning for the dead. In innumerable instances in the Old Testament and later Jewish writings, the number is used as a kind of round number. In the New Testament we have the churches, candlesticks, stars, trumpets, spirits, all to the number of seven; and the seven horns, and seven eyes of the Lamb. The same number appears again either divided into half ($3\frac{1}{2}$ years, Rev. xiii. 5, xi. 3, xii. 6, etc.), or multiplied by ten—seventy Israelites go to Egypt, the exile lasts seventy years, there are seventy elders, and at a later period there are supposed to be seventy languages and seventy nations upon earth. To go back to the earlier documents, we find in a similar way the dove sent out the second time seven days after her first mission. Pharaoh's dream shows him twice seven kine, twice seven ears of corn, etc. Among the Greeks the seven was sacred to Apollo and to Dionysos, who, according to Orphic legends, was torn into seven pieces; and it was particularly sacred in Eubœa, where the number was found to pervade, as it were, almost every sacred, private, or domestic relation. On the many ancient speculations which connected the number seven with the human body and the phases of its gradual development and formation, its critical periods of sicknesses—partly still extant as superstitious notions—we cannot here dwell. The Pythagoreans made much of this number, giving it the name of Athene, Hermes, Hephaistos, Heracles, the virgin unbegotten and unbeggetting (i.e., not to be obtained by multiplication), Dionysos, Rex, etc. The "seven sacraments," the "seven free arts," the "seven wise men," and many more instances, prove the importance attached to this number in the eyes not only of ancient but even of our own times. That it played an immense part in the superstitions of the middle ages need hardly be added.

SEVEN DOLORS OF THE BLESSED VIRGIN MARY, FEAST OF, a modern festival of the Roman Catholic church, which, although bearing the name of devotion to the virgin Mary, in reality regards those incidents in the life and passion of Christ with which his mother is most closely associated. This festival is celebrated on the Friday preceding Palm Sunday (q.v.). The "dolors" or sorrows of the blessed virgin have long been a favorite theme of Roman Catholic devotion, of which the pathetic *Stabat Mater Dolorosa* is the best known and most popular expression; and the festival of the seven dolors is intended to individualize the incidents of her sorrows, and to present them for meditation. The seven incidents referred to under the title of "dolors" are: 1. The prediction of Simeon (Luke ii. 34); 2. The flight into Egypt; 3. The loss of Jesus in Jerusalem; 4. The sight of Jesus bearing his cross toward Calvary; 5. The sight of Jesus upon the cross; 6. The piercing of his side with the lance; 7. His burial. This festival was instituted by pope Benedict XIII. in 1725.

SEVEN PINES, BATTLE OF. See CHICKAHOMINY.

SEVEN SLEEPERS, the heroes of a celebrated legend, which is first related by Gregory of Tours in the close of the 6th c. (*De Gloria Martyrum*, c. 95), but the date of which is assigned to the 3d c., and to the persecution of the Christians under Decius. According to the narrative, during the flight of the Christians from the persecution seven Christians of Ephesus took refuge in a cave near the city, where they were discovered by their pursuers, who walled up the entrance, in order to starve them to death. A miracle, however, was interposed in their behalf; they fell into a preternatural sleep, in which they lay for nearly 200 years. The concealment is supposed to have taken place in 250 or 251; and it was not till the reign of Theodosius, 447, that they were reanimated. On awakening, they imagined that their sleep had been but of a single night; and on one of the party (supposing the persecution still in progress) going into the city to purchase provisions privately, he was amazed to find erected in triumph on the churches and other buildings, a cross, which, as it seemed, but a few hours before, he had seen the object of contempt and blasphemy. When their wonderful history became known, they were conducted in triumphant procession into the city of Ephesus; but they all died at the same moment, as if by one common and mysterious destiny. The same legend reappears with variations at later periods of Christian history.

SEVENTEEN-YEAR LOCUST, *Cicada septendecim*, Linn., a hemipterous insect which is generally supposed to make its appearance every 17 years, and has been popularly regarded in this country in localities not visited by the Rocky-mountain locust as the true Egyptian locust. They sometimes come in such immense swarms as to bend the branches of the trees upon which they alight, and the rattling, shrill music which they make with peculiar abdominal organs fills the air. They make their appearance in the early summer, and when the ovaries are sufficiently developed the females select small branches, and by means of lateral saws and a sharp and strong grooved ovipositor the eggs are laid in fissures, deposited in pairs, but separated from each other by woody fiber, and placed so that one end points upward. When one fissure is filled another is made in close proximity, until 400 or 500 eggs are deposited. The female soon after this dies. Authorities do not agree about the time required for hatching, the accounts ranging from 15 to 50 days. After hatching the larvæ fall to the ground, and, by the use of their strong fore feet, immediately commence burrowing, following the roots of plants, upon which they feed. When their time of transformation approaches they make cir-

cutious cylindrical passages about $\frac{1}{8}$ in. in diameter, and in time emerge from the soil and crawl up the trees. Soon the insect makes its way through a longitudinal fissure in the back of the cast skin, which is left attached to the tree. See CICADA, HARVEST FLY, *ante*, and LOCUST and GRASSHOPPER.

SEVENTH-DAY ADVENTISTS (**ADVENTISTS**, **SEVENTH-DAY**, *ante*), a sect whose peculiar views of prophecy were developed in 1845, just after the great Advent excitement of 1840-44. Elder James White and wife, and elder J. N. Andrews, of Maine, with elder Joseph Bates, of Mass., were the pioneers of this denomination. The first church was formed in Washington, N. H. In 1849 elder James White commenced publishing in connection with this movement. In 1855 this publishing work was removed to its present location, Battle Creek, Mich.; and in 1861 a legally incorporated association was formed under the title of the Seventh-day Adventist publishing association. Four buildings, the central one a large brick structure, are used in printing, electrotyping, binding, and other branches of the work. Nine power-presses and 100 hands are regularly employed in the publishing house, from which are issued 2 weeklies and 2 monthlies in English, 1 semi-monthly in Danish, 1 monthly in German, 1 in Swedish, and a quarterly in the Holland language. Their denominational literature embraces 18 bound books, and numerous tracts and pamphlets, many in the foreign languages above named. They had issued before the autumn of 1880, 230,000,000 pp. of books, pamphlets, and tracts. They also have a large and equally well-equipped publishing house at Oakland, Cal., from which is issued weekly *The Signs of the Times*. They publish a monthly in French at Bâle, Switzerland, and a semi-monthly in Danish at Christiania, Norway. The aggregate monthly circulation of their periodicals is about 85,000 copies.

The government of the denomination is administered by a general conference and 24 state conferences, having under their charge 640 churches with 15,570 members, besides whom several thousands living in many parts of the country have as yet no organized church near them with which they can unite. There are 144 ordained ministers and 116 licentiates. The churches being without settled pastors and maintaining religious services with only occasional ministerial help, the preachers are free to devote themselves chiefly to missionary work. During the summer months they hold meetings in large tents, 70 of which were used in 1879. They have a college and sanitarium at Battle Creek.

Seventh-day Adventists are distinguished from the denominations known as evangelical principally on the three following points: First, the Sabbath, which they hold to be still the seventh day of the week, as ordained in Eden; secondly, the prophecies, which they believe to teach that the second coming of Christ, personally and premillennially, is near at hand; and, thirdly, the nature of man, which they hold to be such as to show that he has no immortality out of Christ. The founders of the denomination were strenuous opposers of the use of alcoholic liquors as a beverage, and of tobacco and other narcotics; and, as the fruit of efforts then begun, the whole denomination are abstainers from the use of alcoholic drinks of all kinds. Tobacco, in all its forms, is also discarded, none addicted to the use of it being received into the churches unless they promise to abandon it immediately. Besides abstinence from these things, which is made a condition of fellowship, other useful reforms are strongly advocated. Articles of diet which experience shows to be unwholesome are little used. Meat is seldom eaten; grains, vegetables, and fruits are the staple articles of food. The reform aimed at is not limited to diet and drink. As the health of the body is greatly affected by the manner in which it is clothed, the subject of dress receives much attention. See **ADVENTISTS**, **SEVENTH-DAY**.

SEVENTH-DAY BAPTISTS. See **SABBATH**, *ante*; **BAPTISTS**, **SEVENTH-DAY**.

SEVEN WISE MASTERS is the title of a mediæval collection of novels, important both from its contents and its widespread popularity. The idea of the work is as follows: A certain prince's son, instructed in all kinds of wisdom by seven sages, finds, from an examination of the stars, on his return to his father's court, that he is in danger of losing his life, if he speaks a word within seven days. His stepmother, whose allurements he had repelled, endeavored in revenge to persuade his father to put him to death, and each day related an artfully constructed story, with the view of furthering her wicked purpose, but its effect was daily neutralized by a rival narrative told by each of the sages. At last, on the expiry of the seven days, the prince himself was enabled to disclose the base designs of his stepmother.—The work is undoubtedly of oriental origin, yet neither the period when it was composed, nor how far it spread through the east, can be ascertained with sufficient accuracy. According to Masudi, it existed in Arabic as a translation from Indian sources before the 10th c., but none of the extant Arabic versions go back so far. Nearest to the original form appears to stand the *Eight Nights* of Nakhshabi, a Persian adaptation of the Indian *Tutiname* (Brockhaus, Leip. 1845). It passed into the literature of western Europe in the 11th or 12th c., through the medium of two redactions, a Hebrew and a Greek, the latter by Andreopulos, under the title of *Syntipas* (see *Das Buch von den sieben weisen Meistern*, translated from the Hebrew and Greek by H. Sengelmann, Halle, 1842; *Syntipas* being republished by Boissonade, Paris, 1828). The work was disseminated through Christendom; sometimes in a complete form; sometimes only particular novels were repro-

duced, under all sorts of names, and with all sorts of modifications; sometimes in verse, sometimes in prose. Latin versions began to appear about the beginning of the 13th c., and Keller has published a French metrical one, from a MS. of 1284 (*Li Romans des Sept Sages*, Tüb. 1836), and Henry Weber an English metrical one (third vol. of the *Metrical Romances*, Edin. 1810). There are several German versions, dating from the 14th century. In the 15th c. a popular German chapbook, *Von den sieben weisen Meistern*, was frequently reprinted (the first edition is dated Augsb. 1473), and is included by Simrock in his collection of German *Volksbücher*.

SEVEN WISE MEN, the collective designation of a number of Greek sages, who lived about 620-548 B.C., and devoted themselves to the cultivation of practical wisdom. Their moral and social experience was embodied in brief aphorisms, sometimes expressed in verse, sometimes in prose. The names of the seven, as usually given, are Solon (q. v.), Thales (q. v.), Pittacus (q. v.), Bias (q. v.), Chilon, Cleobulus, and Periander of Corinth; but there is not absolute unanimity among the ancients either as regards the names, the number, the history, or the sayings of these famous sages. The fragments of wisdom attributed to them which have come down to us are to be found in Orelli's *Opuscula Græcorum Veterum, Sententiosa et Moralia* (Leip. 1819), and have been translated into German by Dilthey in his *Fragmente der sieben Weisen* (Darmstadt, 1835).

SEVEN WONDERS OF THE WORLD were, in ancient times, reckoned to be the Pyramids of Egypt, the hanging gardens of Semiramis at Babylon, the temple of Diana at Ephesus, the statue of Jupiter at Athens by Phidias, the Mausoleum (q. v.), the Colossus (q. v.) at Rhodes, and the Pharos of Alexandria. This cycle of seven wonders originated among the Greeks after the time of Alexander the great, and they were described in a special work by Philo of Byzantium, which has been edited by Orelli.

SEVEN YEARS' WAR, THE, was the third, last, and by far the longest (1756-63) and most terrible of the contests for the possession of Silesia (q. v.). During the two former wars, the empress Maria Theresa had plenty of other work on hand in maintaining her claims to the Austrian dominions (see SUCCESSION, WAR OF AUSTRIAN) to offer any very effective resistance to the aggression of Frederick the great of Prussia; but after emerging triumphantly from this contest she took advantage of the circumstance that the king of Prussia was on bad terms with all the chief continental powers except Turkey and Spain, to renew the struggle for Silesia, which had been snatched from her at the moment of her greatest straits. She found the czarina Elizabeth, the king of Poland and elector of Saxony, and Louis XV. of France (or rather madame de Pompadour), ready to enter into an offensive and defensive treaty with her. On the other hand, Britain (then at war with France) engaged to assist Prussia with an army in Hanover, and with subsidies when necessary. Resolving to anticipate his enemies, and secure a safe basis for future operations, Frederick made a sudden advance (Aug., 1756) on Dresden with 60,000 men, took possession of the country, which he governed from this time with slight intervals to the end of the war, and cooped up the Saxon army, 18,000 strong, between Pirna and Königstein. On the Austrians under Browne advancing to relieve their allies, they were met by Frederick at Lobositz (Oct. 1), and after an indecisive contest were obliged to retreat. The Saxons then surrendered (Oct. 14), and were mostly incorporated with the Prussian army, which went into winter-quarters in Saxony and Silesia.—The *second campaign* (1757) began under more favorable auspices for the Austrian coalition, as the rapid action of Frederick had taken it somewhat by surprise in the preceding autumn; besides, Sweden (subsidized by France) became a fourth in the coalition, in order to recover Pomerania, and the German reich or empire raised an army, 33,000 strong, to assist Austria. A combined attack was now made by a French army (100,000) on Hanover; another French army (30,000) on Hesse-Cassel (an ally of Prussia), with a view to reach Saxony; an Austrian army from Bohemia on Saxony and another on Silesia, both of them at first united under marshal Daun, but latterly (1760) separated, under Daun and Loudon; the Russians (100,000) on the e. and n.e.; and the Swedes (22,000) in Pomerania; while the imperial army sometimes joined the southern French, and sometimes the w. Austrian armies. To oppose these armies, numbering in all 430,000, Frederick had the combined British-Hanoverian-Hessian army (60,000) in Hanover, and a Prussian army of 200,000 strong, which was distributed, as need required, over the various points attacked; but he relied much on the rapidity of his movements and the harmonious completeness of his plans. In April, Frederick, leaving a corps of 24,000 under Lewald to resist the Swedes and Russians, invaded Bohemia, drove in the advanced corps of the Austrians upon their main army, which he then completely routed at Prague (May 6), with a loss on his side of 18,000, and of 19,000 on the part of the Austrians. Marshals Schwerin (Prussian) and Browne (Austrian) fell in this conflict. Frederick immediately invested Prague, to which prince Charles of Lorraine, with 46,000 men, had retreated; but Daun, who advanced from Moravia to its relief, inflicted on the Prussians a crushing defeat at Kolin (June 18), and forced them to retire from Bohemia. The n. French army had meanwhile, under marshal d'Estrees, advanced into Hanover, defeated the incapable duke of Cumberland at Hastenbeck (July 26), and compelled him to capitulate, on condition that the whole of his army, excepting the Hanoverians, should be disbanded. But the British government refused to ratify this shameful treaty, and speedily raised another army of similar com-

position, which was placed under the command of duke Ferdinand of Brunswick, an able leader, who again drove back the French, and proved himself so capable to hold them in check, that Frederick ceased to have any apprehensions from this quarter. The s. French army under Soubise had also advanced in conjunction with the imperialists under the prince of Hildburghausen in the direction of Saxony, but Frederick was not prepared to lose this valuable vantage-ground, and falling upon them at Rossbach (q. v.) (Nov. 5), he put them completely to rout. During his absence, however, the Austrians had broken into Silesia, routed his armies, and compelled them to retire; so, compelled to use the utmost expedition in returning, he collected a small army, defeated a thrice as numerous force of Austrians under prince Charles of Lorraine at Lenthien (Dec. 5), and recovered Silesia. On the e. the Russians had appeared in great force, captured Memel, committing the most horrible devastations, and had routed Lewald at Grossjägerndorf (Aug. 30), when the change of Russian policy due to the illness and apparently impending demise of the czarina, caused them to relinquish almost all their conquests; Lewald then attacked and defeated the Swedes, driving them under the walls of Stralsund. Thus closed the second campaign, leaving matters very much as they were at the commencement.—Duke Ferdinand opened the *third campaign* (1758) by driving the French from lower Saxony, pursued them across the Rhine, and defeated them near Krefeld (June 23); but Contades, the new French commander, having obtained the co-operation of Soubise, compelled him to retrace his steps, till, receiving a re-enforcement of 12,000 British, Ferdinand again advanced, throwing Contades between the Rhine and Meuse, and Soubise between the Rhine and Main. Meanwhile Frederick had not been idle, for after being driven out of Moravia (which he had invaded in spring) by Daun, he marched northward with a portion of his army to meet the Russians, who, the czarina having recovered, had again invaded Brandenburg, and defeated them in a desperate battle at Zorndorf (Aug. 25), compelling them to retreat into Poland. Frederick's presence was next needed in Saxony, where his brother, prince Henry, was being hard pressed by Daun with superior forces; but on his arrival the Austrians retreated eastward till Oct. 14, when Daun turned, took Frederick completely by surprise, and gave him a severe defeat at Hochkirch (q. v.), though before the end of the year the Prussians were again in possession of Saxony. Thus passed another campaign with a slight advantage to the Prussians.—The *fourth campaign* (1759) (preceded by fruitless attempts at negotiation with France, on the part of Frederick), though signalized by only two great actions, was more unfortunate for Prussia. The French under Soubise had captured Frankfurt during the winter, and the duke of Brunswick, in attempting to recover it, was defeated at Bergen (April 13), by Broglie (the successor of Soubise), and compelled to resign the whole of Hesse to the French; but later in the year, his signal victory at Minden (Aug. 1) over Contades and Broglie, and that of his relative, the hereditary prince of Brunswick, at Goltfeld on the same day, recovered most of Westphalia, and drove the southern French beyond the Lahn and Rhine. But in the Saxon district, although prince Henry invaded Bohemia (April), capturing immense supplies, and cleared Franconia (May) of Austrians and imperialists, he subsequently evacuated Saxony, which was then occupied by the imperialists, and London's Austrians advanced into Lusatia. In Silesia Fouqué gallantly kept the Austrians at bay; and Dohna continued to coop up the Swedes about Stralsund, keeping at the same time an eye on the Russians; but the latter soon gathered in such force that he was compelled to retreat. His successor, Wedel, in attempting to bar their advance, was routed near Züllichau (July 23), and though Frederick hastened to his assistance, attacked them at Kunersdorf (q. v.) (Aug. 12), and had almost gained the day, the arrival of Marshal Loudon with an Austrian force turned the tide, and converted this almost victory into the most signal defeat suffered by the Prussians during the whole war. On the following morning he could hardly muster 5,000 men; but, luckily, the Russians showed no inclination to follow up their victory, and by untiring perseverance, the Prussian monarch succeeded in raising another army 28,000 strong. Though it seemed almost impossible for him to prevent the meditated junction of the Russians and Austrians in Brandenburg; yet, by dint of skillful maneuvering, he succeeded in compelling the Russians to retire to Poland; and prince Henry, by cutting off their supplies, forced the Austrians into Saxony. On Nov. 21, however, he suffered a severe blow in the capture of Finck with 11,000 Prussians, at Maxen in Saxony. With greatly diminished strength, an exhausted treasury (chiefly supplied by the English subsidy, the taxes of Saxony, and forced contributions on Mecklenburg, Saxony, and Anhalt), a desolated territory incapable of affording either men or supplies, and gloomy forebodings of the final issue, though with unflinching resolution never to yield, Frederick prepared for his *fifth campaign* (1760).—His army in Prussia, now reduced to 90,000 men, mostly foreigners and raw recruits, was still further diminished by the capture of Fouqué with 8,000 men in Silesia, followed by Marshal Loudon's conquest of that province, though the brilliant victory of Liegnitz (Aug. 15) subsequently restored him the north-western division of it; he then joined his brother, prince Henry, drove the Russians across the Oder, and Daun into Bohemia; but his strength was now becoming glaringly insufficient for the task to which he had set himself; the Russians and Austrians captured and plundered Berlin (Oct. 3); the Swedes came down from the north, and Loudon's Austrians upward through Silesia, so that he was now fairly in the toils. But, like a lion in the midst of the hunters, he turned upon

his most able and pertinacious adversary, Daun, terribly routed him at Torgau (Nov. 3) in Saxony, then drove Loudon into Glatz, and frightened away the Russians to Poland, and the Swedes to Stralsund. In the w. the fortune of Prussia was in the ascendant, and the French, defeated by prince Charles of Brunswick at Einsdorf (July 13), and by duke Ferdinand at Marburg (July 31), were again confined to Hesse.—The *sixth campaign* (1761) on the Rhine commenced still more auspiciously for Frederick, as the French were driven in detail from their strongholds, had their supplies captured, suffered defeat by the Hanoverians at Langensulza (Feb. 14), and by duke Ferdinand at Villingshausen (July 15), though in the end Broglie and Soubise again gained possession of Hesse. In Silesia Frederick attempted to bar the progress of the Austrians, so as to prevent their junction with the Russians, and so opposing 130,000 men to his poor remnant of 50,000; but in vain; however, the union was productive of no ill results to him, for scarcity of provisions speedily compelled the Russians to retreat to Poland, after which Loudon retired to upper Silesia, capturing Schweidnitz with 3,700 men on his way. In Saxony, prince Henry had to retreat before Daun, and the Prussians were ejected from Pomerania by the Russians and Swedes, all subsidies from Britain stopped by the earl of Bute after George II.'s death, and the country ravaged in all directions, so that things were now in a desperate condition, and Prussia almost at its last gasp. Frederick's assailants had cooped him up within southern Brandenburg and north-western Silesia, and though as resolute as ever to fight on, it seemed as if another campaign must bring him to final ruin. But the death of the czarina (Jan. 5, 1762) converted the most powerful of his enemies into a fast friend; Sweden, which had suffered uninterrupted reverses during the whole war, also retired from the alliance—and the *seventh campaign* (1762) commenced on equal terms, as Austria and France were almost as much exhausted as Prussia. On the refusal of Austria to submit her cause to arbitration, the czar Peter III. joined his army to that of Frederick; but his successor, Catharine II., ordered the return of the army, though her strict neutrality was of itself an immense benefit. Frederick had now no fears for the result. Nor had he any reason, as subsequent events showed, for on July 21 he drove an Austrian force from its intrenchments at Burkardsdorf, and following up his success, routed Daun at Reichenbach (Aug. 16), and took Schweidnitz (Oct. 9); while prince Henry, by a series of fortunate maneuvers, possessed himself of the passes of the Erzgebirge, and with the valuable aid of Seidlitz, completely overthrew the other Austrian army at Freiberg (Oct. 22); and the two Brunswicks nobly sustained the glory of Prussia at Wilhelmsthal (June 24) and Luternberg (July 23), capturing Cassel, and recovering the whole of Hesse. France now gave up a contest from which she had gathered nothing but military disgrace, and concluded treaties with Britain and Prussia; while Prussia and Austria agreed to an armistice with regard to Saxony and Silesia, of which the astute Frederick took advantage to send Kleist on a raid through Franconia and Bavaria, which had the effect of withdrawing the minor German states from the coalition. Maria Theresa was now left alone, and sorely against her will, was compelled to conclude the peace of Hubertsburg, Feb. 15, 1763, which finally acknowledged Frederick as the lord of Silesia. This long and desperate conflict made no change in the territorial distribution of Europe, but increased tenfold the moral power of Prussia, and gave its army a prestige which it retained till the battle of Jena. It cost Europe a million lives, and prostrated the strength of almost all the powers who had engaged in it.—See, for a complete account, Carlyle's *History of Frederick the Great*.

SEVERALLY, in English law, is the enjoyment by an individual of an estate in contradistinction to joint (q.v.).

SEVERN, one of the most important and beautiful, and, after the Thames, the largest of the rivers of England, rises from a chalybeate spring on the eastern side of Plinlimmon, about 11 m. w. of Llanidloes, in Montgomeryshire, North Wales. Flowing eastward from its source to Llanidloes, to which town it retains its original British name of Hafren, it afterward flows n.e. to the eastern boundary of Montgomeryshire, then e.s.e., past Bridgenorth in Salop, and finally southward through Worcester and Gloucester, in which last it begins to form its estuary. It is navigable for barges to Welshpool in Montgomeryshire, 180 m. from its mouth. Its entire length is 210 m., and it drains an area of more than 6,000 sq. miles. The chief affluents of the Severn are the Teme, and the upper and lower Avon on the e., and the Teme and Wye on the west. A canal 18½ m. long, and navigable for vessels of 350 tons, extends from Gloucester to the upper portion of the estuary of the river, and thus materially shortens the navigation of its lower course. The Montgomery canal extends from Welshpool to Newton, and other canals establish communication between the Severn and the Thames, Trent, Mersey, and the other important rivers of the middle districts of England. The *bore*, or tidal wave, which rushes up the Severn with a velocity at times of 14 m. an hour, raises the water 9 ft. in height at Gloucester, below which embankments have been constructed along the water-course to prevent inundation. See BRISTOL CHANNEL.

SEVERUS, ALEXANDER. See ALEXANDER SEVERUS.

SEVERUS, L. SEPTIMIUS, Roman emperor, was born April 11, 146 A.D., near Leptis Magna, on the n. coast of Africa, of a family of equestrian rank; and, after receiving an excellent education, removed to Rome, where he became prætor. 178 A.D. He was subsequently commander of a legion in Gaul, and governor of Gallia Lugdunensis,

Pannonia, and other provinces. After the murder of Pertinax he was proclaimed emperor, 193 A.D., at Carnutum, and promptly marched upon Rome, where the puppet Julianus had by purchase obtained the imperial purple. His arrival before Rome was the death-signal for Julianus; and after taking vengeance on the murderers of Pertinax, converting his most formidable rival, Clodius Albinus, into an ally by creating him Cæsar, and distributing an extravagant largess to his soldiers, he marched against Pescennius Niger, and conquered him at Issus, 195 A.D. A glorious campaign in the east, and a three years' siege, followed by the capture of Byzantium, were followed by a desperate struggle with his jealous rival, Clodius Albinus, whom, after an obstinate conflict at Lyons, in which 150,000 were engaged on each side, he conquered, 197 A.D. The usual games to the degenerate citizens of Rome, and largesses to the troops, followed, after which Severus returned to Asia, accompanied by his sons Caracalla and Geta, met with the most brilliant success in the campaign of 198 A.D. against the Parthians, and took and plundered their capital, Ctesiphon. After a war with the Arabs, in which Severus's usual good fortune deserted him, and a general visit to his various eastern dominions, he returned to Rome, 202 A.D., and gratified the popular taste by the exhibition of shows of unparalleled magnificence, also distributing another extravagant largess to the citizens and prætorians. A rebellion in Britain drew him to that country in 208 A.D.; and, at the head of an immense army, he marched, it is said, to the extreme n. of the island, encountering enormous hardships, to which no less than 50,000 of his soldiers succumbed, and securing no permanent advantages. To secure to some extent the natives of s. Britain from the incursions of the Menæe and Caledonians, Severus commenced the wall which bears his name, and died soon after at York, Feb. 4, 211 A.D. Severus was an able, vigorous, and just ruler, and a skillful warrior, but totally devoid of high moral sentiment, a diffidently especially observable in cases where his own interests were involved.

SEVERUS, WALL OF, a rampart of stone built by the Roman emperor Severus in Britain, 208 A.D., between the Tyne and the Solway. On the first subjugation of Britain by the Romans, a line of forts had been constructed by Agricola, extending from the Forth at Edinburgh to the Clyde at Dumbarton. The emperor Hadrian, on visiting Britain, 120 A.D., threw up for the protection of the Roman province a wall of turf extending across the narrowest part of the island, between Tyne and Solway. Twenty years later Antoninus Pius, whose lieutenant, Lollius Urbicus, had gained fresh advantages over the northern tribes, endeavored to check the incursions of the Caledonians by erecting another rampart of earth between the Forth and Clyde, connecting Agricola's line forts. But after a vain struggle of 60 years, the Romans found it necessary to abandon the whole district between the walls, and Septimius Severus built a rampart of stone immediately to the n. of the wall of Hadrian. Toward the close of the 4th c. Theodosius, for a brief period, reasserted the Roman dominion over the district between the walls of Antonine and Severus, which, in honor of the emperor Valens, obtained the name of Valentia. But this newly-established province was soon lost, and it was not long before the Romans finally abandoned Britain. Many remains of the Roman walls are yet to be traced. See Bruce's *Roman Wall*, 2d ed. 1853.

SEVIER, a co. in s.w. Arkansas, having the territorial line of the Indian territory for its w. boundary, 750 sq.m.; pop. '80, 6,192—6,173 of American birth, 1,103 colored. The Little river forms its s. boundary, and it is drained by that river and its branches, one of which is its e. border. Its surface is diversified, a large proportion covered with hickory, oak, pine, and osage orange. Its soil is fertile; producing cotton, maize, sweet-potatoes, tobacco, etc. Its mineral products are lead, limestone, and slate. Co. seat, Lockesburg.

SEVIER, a co. in e. Tennessee, having the Great Smoky or Unaka mountains for its s. boundary, separating it from North Carolina; 450 sq.m.: pop. '80, 15,541—15,532 of American birth, 693 colored. It is drained by the French Broad and Little Pigeon rivers in the n., the former dividing a ridge of mountains. The central portion sinks into valleys and bottom lands of great beauty and fertility. In the hills are ledges of limestone and beds of iron ore. The surface is well timbered with oak, pine, and sugar-maple. The soil produces wheat, corn, oats, tobacco, maple sugar, and sorghum. Large numbers of cattle are raised. Co. seat, Sevierville.

SEVIER, a large co. in Utah, adjoining Colorado, crossed by the Wahsatch mountains; drained by the Sevier, Green, and Grand rivers; pop. '70, 19, none of whom were of American birth. The surface is table land or plain. The soil is arid. Co. seat, Richfield.

SEVIER, JOHN, 1745-1815; b. Va., explored the Holston river, in Tennessee, in 1769; built fort Watauga and defended it. He participated in Dunmore's expedition with the rank of capt., and fought in the battle of Point Pleasant. In 1772 he was delegate to a convention at Halifax, N. C., member of the assembly, 1777; lieutenant-col. in the same year, and in 1779 gained a victory at Boyd's creek, and was a leader at King's mountain, 1780, receiving, in recognition of his services, a sword and the thanks of the legislature of North Carolina. He took part in the battle of Musgrove's mills, and in 1781 fought under Marion, and was made brig. gen. In 1784 governor of Ten-

nessee, then called Franklin. In 1786 he went to war with the Cherokees; governor of the newly organized state of Tennessee; 1788-1801 and 1803-9; member of congress, 1811-15. He died on a mission to the Creek Indians.

SEVIER, LAKE, in s.w. Utah. A considerable body of salt water in Millard co., at an elevation of 4,600 ft. above the level of the sea; 140 sq. m.; 20 m. in length from n. to s., 10 m. wide. Its position is 120 m. s.w. of Great Salt lake, with no outlet; it is destitute of islands; its shores have no trees and few bushes. The Sevier river, its only tributary, empties into the n. portion. It is in Pauvan valley, a part of the Sevier desert. It is open only on the n. side, the House range of mountains guarding the w. border, and the Beaver creek range the eastern. Gulls and other birds which feed on fish, frequent the mouth of the river, seeking fresh water fish which have come down through the river, and have died from the effect of the brine. Shrimps and insect larvæ are found in the water. In 1872 the brine was found, on being analyzed, to contain 62.3 parts in 1000 of chloride of sodium, 13.4 of sulphate of soda, 10.3 of chloride of magnesium, and 0.4 of sulphate of lime. The action of the atmosphere determines its extent; in dry weather its beaches recede; moisture in the air has the contrary effect. The water once occupied most of the Sevier desert, discharging into Salt lake, the channel being still visible 50 m. n. of the present boundary between the Sevier and Salt lake deserts. The track of the current is called the Old River bed, where the springs occur only in intervals of 50 miles. There was a time when the waters of Great Salt and Sevier lakes united in one large lake called Bonnaville, with outlets through Snake and Columbia rivers. The shore lines are defined by fresh-water shells, showing that it covered Great Salt lake, Sevier, and Escalante deserts, and overflowed into the valleys of Utah, Juab, Rush, Skull, Preuss, Snake, and Cedar. Its former level was 575 ft. above the level of Sevier lake in 1872, and 938 ft. above Great Salt lake in 1873, and it was 125 m. wide.

SEVIGNÉ, MADAME DE, MARIE DE RABUTIN-CHANTAL, was b. at Paris, Feb. 6, 1626. She was the only daughter of the baron de Chantal, Celse-Benigne de Rabutin, and his wife, Marie de Coulange. She was left early an orphan; and at the age of six the care of her education devolved on her maternal uncle, the abbé de Coulange, an excellent and amiable man, who most conscientiously acquitted himself of his charge, and for whom through life his niece entertained the tenderest affection. She was carefully instructed in all the knowledge which then appertained to the education of a French gentlewoman; by the eminent scholar Menage she was taught Latin, Italian, and Spanish; and M. Chapelain, another literary notability of the time, also assisted in her culture. At the age of 18 (Aug. 1, 1644), she was married to the marquis Henri de Sevigné, the representative of an ancient house in Brittany. The union was not a happy one. The marquis was "a man of wit and pleasure," of the type of the period; his wit he exhibited by his happy way of squandering his wife's fortune, and he took his pleasure in neglect of her, and addiction to other women. After a time, he was killed in a duel (Feb. 5, 1651), by a certain chevalier d'Albret, his rival in a love-affair. Left with a son and daughter, Sevigné now for a few years retired almost wholly from society, and devoted herself to their education. In 1654 she returned to Paris, where her beauty, her wit, her happy social tact and vivacity, concurred, with the charm of her sweet and kindly nature, to insure her unrivaled success in the brilliant society of the period. Her lovers were legion, and among them were numbered some of the most distinguished men of whom France could then boast, as the prince de Conti, Turenne, Fouquet the superintendent of finance, and others. But they sighed in vain: all offers of marriage she steadily declined; and from any of those lighter ties, there and then most leniently looked on—if not almost considered *comme il faut*—she has left no spot upon her reputation. For her virtue she must have credit as virtue, and not merely the coldness which simulates it; for she was obviously of a warm, eager, even somewhat impulsive nature. Her numerous and warm friendships, with her absolute devotion to her children, may have sufficed as food of a heart not unlikely, in lack of these, to have craved a more perilous diet. Her affection for her daughter in particular, who in 1669 became Madame de Grignan, was the ruling passion of her life; and to the separation of the mother, over long periods, from "this infinitely dear child," the world is indebted for by much the larger moiety of the collection of letters which has given fame in perpetuity to Madame de Sevigné. Madame de Grignan was one of the most beautiful and accomplished women of her time, and every way worthy of the love thus lavished without stint upon her. If she did not reciprocate its full fervor, *that*, as the shrewd mother well knew, was simply in the nature of the case; and not to have demonstrated in return more rapture than she really felt, ought to count as a point in her favor, rather than reverse-wise as it has been held to do. If it was the one main grief of Madame de Sevigné to be forced to live apart from her daughter, the happiness of dying beside her may perhaps have a little consoled her for it. In 1696, while on a visit to the château de Grignan, she was seized with malignant small-pox, and died at the age of 70.

The letters of Madame de Sevigné, on which her fame securely rests, are charming in the *abandon* and easy *naïve* frankness with which they reveal her beautiful nature. They sparkle with French *esprit* and spontaneous gaiety of heart; and their writer is scarce anywhere quite equalled in the delicate *finesse* with which, in a few careless rapid words, she flings off a scrap of light narrative, dashes in a little graceful picture, or

points a dramatic situation. Above all remarkable is the lightly-moved and ever-active sympathy which keeps her exquisitely *en rapport* with the interest of whatever may be passing before her.

SEVILLE, a province of Spain, included under the division of Andalusia; bordering on the Atlantic to the s. and s.w.; bounded n. by Estremadura, and w. by Portugal; 5,295 sq.m.; pop. '70, 515,011. The greater part of the surface is a plain, through which the Guadalquivir river flows. In the n. are the Morena mountains; the s. is hilly. Most of the land is highly fertile; corn, grapes, olives, wheat, and maize are raised in large quantities. The province was once occupied by the Moors, and their ruined walls and castles are still to be seen. Besides the capital Seville, Carmona and Ecija are the chief towns.

SEVILLE (Span. *Sevilla*, the *Hispalis* of the Romans), a famous city of Spain, formerly capital of the ancient kingdom, and now of the modern province of the same name, stands on the left bank of the Guadalquivir, 94 m. by railway n.e. of Cadiz. The city is almost circular in shape, is surrounded by Moorish walls, surmounted with 66 (formerly 166) towers, and pierced with 15 gates, and is 5 m., or including its 10 suburbs, 10 m. in circumference. Held by the Moors for five centuries, and entirely rebuilt by them from the materials of former Roman edifices, Seville was long a purely Moorish city, and the old Moorish houses, which age, in this dry climate, has done little to destroy, are still the best houses to be seen. Half of the city still preserves its ancient character; but changes are taking place every year. The narrow tortuous streets that kept out the sun, with their wide spacious mansions, with ample courts and gardens, so perfectly suited to the climate, are giving way to spacious straight streets of small, hot houses, open to the blaze of noon. The cathedral, one of the largest and finest in Spain, is an imposing edifice, of which the solemn and grandiose are the distinctive qualities. It was completed in 1519, is 431 ft. long, 315 ft. wide, has 7 aisles, and an organ with 5,400 pipes. The pavement is in black and white checkered marble. The cathedral is superbly decorated. Its painted windows are among the finest in Spain, and it contains paintings by Murillo, Vargas, the Herreras, etc. Attached to the cathedral is one of the most remarkable towers in the world. It is called the Giralda (i.e. a weather-cock in the form a statue), and is in all 350 ft. high. This Moorish tower was built in 1196, and was originally only 250 ft. high, the additional 100 ft. being the rich filigree belfry added in 1568. The pinnacle is crowned by a female figure in bronze, 14 ft. high, and 2,800 lbs. in weight, and which veers about with the slightest breeze. From this great tower the *muddîn* (q.v.) of Mohammedan days called the faithful to prayers. The royal residence, the Alcázar (*Al-Kasr*, house of Caesar), contains several noble halls, and much delicate ornamentation, that rivals that of the Alhambra. The house in which Murillo lived and died is still to be seen here. The finest pictures in Seville are to be seen in the cathedral, the caridad, the musco, and the university. Seville contains 74 churches; but prior to the suppression of monasteries it contained 140. Besides the university (of four faculties), there are many educational institutions. The city contains upward of 100 squares. The fabrica de tabacos, where tobacco is made into snuff and cigars, employs several thousand hands, mostly females. The Plaza de Toros can accommodate upward of 12,000 spectators. There is regular communication with Cadiz by river and rail. There are here several royal foundries and factories for arms, and porcelain and iron and machine works. Weaving, soap-making, and other branches of manufacture are carried on. Pop. about 118,000.

The Hispal of the Phenicians, the *Hispalis* of the Romans, was corrupted by the Moors into *Ishbilliah*, of which it is supposed the modern name is a modification. It was a place of great importance in the later period of Roman dominion; became the capital of southern Spain during the ascendancy of the Vandals and the Goths, when it was the scene of two notable church councils (590 A.D. and 619 A.D.); and fell into the hands of the Moors in the 8th c., under whom it rapidly rose to a splendid prosperity, and reckoned 400,000 inhabitants. In 1026 it became the capital of the Moorish kingdom ruled by the Abadides, from whom it passed, in 1091, to the Almoravides, and in 1147 to the Almohades. In 1248 it was taken by Ferdinand III. of Castile, when 300,000 Moors left for Grenada and Africa; and from this time to the removal of the court to Valladolid, in the reign of Charles V., Seville was the capital of Spain. The city rose to its climax of prosperity after the discovery of the new world, when it became the residence of princely merchants, and the mart of the colonies, but its trade was afterward transferred to Cadiz. In 1810 it was taken and ravaged by Soult. It capitulated to Espartero in 1843.

SEVRES, a small t. of France, in the dep. of Seine-et-Oise, 6 m. s.w. of Paris, on the Paris and Versailles railway. It is celebrated for its manufacture of porcelain wares, which are unsurpassed for elegance of design and beauty of painting. Painted glass is also manufactured. The porcelain museum, which was destroyed during the war of 1870, contained a large and curious collection of articles in china and earthenware from all parts of the globe. Pop. '76, 6,512.

SEVRES, DEUX-, an inland dep. in the w. of France, between the deps. Vienne on the e. and Vendée on the west. Area, 2,315 sq.m.; pop. '76, 336,655. The dep. takes its name from two rivers of the same name, the Sèvre-Niortaise, which flows w. into the

sea, and the Sèvre-Nantaise, an affluent of the Loire. It is traversed from s.e. to n.w. by a chain of hills, called in the s.e. the *Monts du Poitou*, and in the n., the *Plateau de Gâtine*. This ridge forms the water-shed between the Loire on the n. and the Charente on the south. The climate is generally healthy, and the soil, two-thirds of which is arable, is very fertile. There are numerous iron mines, and good quarries of freestone and marble. The *arrondissements* are Niort, Bressuire, Melle, and Parthenay. Niort is the capital.

SEW'AGE. It is of the first importance to health for houses, both in the town and in the country, that all filth should be removed from them as speedily as possible, and disposed of in such a manner as to cease to be injurious to mankind. It may be taken as a pretty safe general guide, that all matters which give off a disagreeable smell are dangerous if allowed to remain near our dwellings; nature thus giving us warning of the presence of something that may do us harm. Many people have thought that if, by using certain deodorizing materials, they could either fix this effluvium permanently or for a time, they had surmounted the difficulty; but this is scarcely half a cure, and a palliative like this is much less advisable than a radical measure of removing the filth by suspension in water, and rendering of it not only innocuous, but beneficial, by incorporating it with the great deodorizer—living vegetation. It seems as if nature had planned all this for us, if we will only follow her teaching. During the first two or three days after sewage is deposited in water, the smell is unpleasant, but not dangerous to mankind; after that, putrefaction begins, and the gases given off become deleterious. Here, then, is time for removal, and a punishment for neglect. Fevers, gangrene, ophthalmia, and many other diseases, especially among children, are certain to break out and become malignant if the emanations from such filth exist in the air around human habitations. Until within the last 50 years, privy-pits and cesspools prevailed everywhere. In the country the former were generally placed in the garden attached to the house, and at some distance off, so that there was not much danger attached to them. In the towns cesspools existed among the houses, but they were very objectionable and dangerous, and constantly neglected. These cesspools were large underground tanks built in brickwork, into which all the sewage from the house was discharged. In them the filth accumulated and putrified until it was periodically removed by manual labor. They acted like an immense brewing vessel sending up deadly vapors which had no escape, except back into the house among the inhabitants. The cesspools also frequently leaked, and so if any wells were near poisoned the water. When Bramah invented the water-closet, and a larger supply of water had to be found for towns, the cesspools began to overflow at such a rate that a general revision of the whole system became necessary, and at the same time medical men insisted upon the continuous and perfect removal of filth as the only reliable sanitary process of dealing with the matter. A return to the use of cesspools in any form would therefore be a step in the wrong direction, and would lead to disastrous results.

We may divide the subject as follows: 1. The management of the sewage of cottages; 2. Dwelling-houses and public buildings in the country; 3. Towns; and 4. The utilization of sewage.

1. *Cottages.*—It is obvious that in the case of single detached cottages expensive arrangements such as those necessary for water-closets could not be provided, and some simpler plan must be followed.

It is very objectionable to allow either cesspool or privy-pit, if they can be avoided, as they are constantly neglected, and overflow into some stream, or poison the wells and the air. The privy should be placed, wherever that can be managed, on the n. or e. side, and to the rear of the house, so as not to be between the people and the sun and softest winds. The whole sewage-matter should be received in a square galvanized iron pail underneath a seat, which pail can be removed from the outside, and into which a small quantity of house-ashes should be placed, either daily, or as often as the closet is used. This will quite fix the ammonia. The iron pail must be removed by the cottagers at least once a week, and emptied into their garden. No danger can possibly arise from this, if strictly followed, and all the sewage-matter is placed to its best purpose. There has not been found any difficulty in introducing this system among cottagers.

2. *Dwelling-houses and Public Buildings in the Country.*—It would be useless to discuss a dry-earth system like what has been mentioned anywhere but for outhouses attached to cottages; the general feelings of the inhabitants would not tolerate it. We must therefore accept the water-closet as the system universally adopted. In planning the position of water-closets for a house, the first thing to be thought of is, that they shall be if possible on the n. or cool side of the house, and upon exterior walls. If they are placed in the interior of the house, it is troublesome to get at the drains when required, and the closets themselves cannot be sufficiently ventilated. If the closet is inside the house, then Bramah's patent with a D trap underneath is the only form that should be used; but if the closet is outside, then a less expensive one with a syphon earthenware trap may be adopted. It is desirable that the closet should be surrounded with brick walls, and, in fact, isolated from all other parts of the house. The window of the closet when inside the house should always reach the ceiling; and a ventilating

shaft is desirable where the closet is much used, and the window must be shut occasionally. The ordinary water that passes into the drains leading from any closet—such as is discharged each time that the handle is raised—is not sufficient to sweep out thoroughly all the solid matter from the drain-pipes, and therefore a flushing apparatus at the highest point of all sets of drains is essential, so that a body of water may be allowed to pass down with a rush at least twice or three times a week. It is also desirable that the foul air engendered in the drain-pipes themselves should have some free outlet into the air at some point where it will not be injurious. The gas given off under such circumstances is of a very light character, and has a great tendency to ascend and draw toward heat. During the greater part of the year, especially since the system has been introduced of heating houses by hot air, the temperature of living-rooms is much higher than the atmosphere outside; a pumping action is exercised upon the drains, or indeed upon any outlet, for a fresh supply. If, therefore, some safety-valve is not provided, the gas will force an entry either the traps or some imperfection in the joints of the drains. In constructing the drains from houses or large public buildings, it is now a well-decided point that there should be an entirely separate system for the sewage or foul water, apart from that for rain and surface-water. The reasons are many and obvious, but they are given more appropriately under the head of the drainage of towns. Stoneware pipes are the best material to be used for drains, because they are perfectly non-absorbent; but in many cases glazed earthenware will answer very well. The smallest size of pipes of any description that should be used for removing sewage from a house is 6 in. in diameter. This size, then, may be gradually increased as is necessary, and one of 9 in. will remove the sewage of 500 people. The best fall to be given to a sewage-drain is 1 in. in 10 ft.; but all will work well from 1 in. in 5 ft. up to 1 in. in 60—provided the flushing arrangements are as they ought to be. In order to keep the drains clean, not less than 10 gal. of water daily should pass down the drain for every person in the house; while anything over 25 gal. is superfluous. At every 20 yards there should be a pipe laid from which the upper half can be removed, and the interior inspected at any time, and any stoppage remedied without the necessity of breaking the pipes. Greasy water, such as is poured down from the kitchen and scullery of a house, is one of the constant causes of such stoppages. The fat, as it cools, congeals on the sides of the pipes, and forms a hard cake. The best method of preventing this is to form a small cesspool, into which the kitchen water is poured first, and then to take an overflow through a syphon into the foul drain, so that the liquid only enters, while the fat can be removed by hand from the cesspool. The sewage-matter having been thus all thoroughly removed from the house, a sewage-filter should be built. The solid and liquid matters of the sewage are here mechanically separated, and the former can be removed from time to time—say once in six weeks or two months—while the latter must be passed on for irrigation. It is clearly illegal to pass it into any stream; and it is apt to become a serious nuisance if anything else is done with it. We shall treat of the best method of utilizing this liquid under the fourth head. It is always advisable to get space for all these arrangements on the n. and e. side of a house, when possible, so as to run no risk of contaminating the air on the s. or hot side of a dwelling; and if a belt of trees can be placed between the sewage-filter and the irrigated land and the house, it will also be advantageous.

3. *The Drainage of Towns.*—Until within the last 40 years, the only drainage which existed in towns was for the rain-water and surface-water alone, and the inhabitants were strictly watched to prevent their passing any sewage matter into these drains. The introduction of the water-closet, however, gradually increased the water which overflowed from the old cesspools to such an extent that it was impossible to prevent overflows of this description, and systems of drainage were designed to carry off the whole, both sewage and rain-water. A very composite system of drainage then arose. Generally, the bed of some stream or natural rivulet passing through the town was covered over, and the whole filth passed into that along with the rain-fall of the district. This soon was found unsatisfactory, because the flood-waters of the stream were not to be relied on to keep the channel clean, and so the filth remained festering underneath the ground, giving off deadly gases in the midst of the population. The next arrangement which succeeded to that system was to plan large drains for the rain and surface-water and sewage, and still keeping the idea of the size of the bed of a natural stream before them, engineers thought it necessary to make all the main drains large enough for a man to pass through them, and keep them clean. Seeing the vast quantity of sand and grit that was occasionally washed off the streets, something might be said in defense of this system. Vast numbers of these great main sewers still exist. Into these sewers all the smaller house-drains were to enter, and the surface-water through street-gratings as well. The ordinary water used for domestic purposes, and the occasional rain-falls, were relied upon to flush those large main sewers; but their great size made this an exceedingly difficult and uncertain process, and they, in fact, became only cesspools elongated. In dry weather, the filth was retained in them to such an extent, that after heavy rains, chemical analysis showed that the water that was discharged contained frequently twenty times the amount of human fecal matter per gallon more than it did in dry weather. This state of matters, added to the fact that long-continued dry weather was

always attended by an increase of deaths from typhus and other fevers, clearly showed that something more must be done. A further step was then taken by sanitary engineers. The idea of men passing up the drains was set aside, and the smallest possible drains were constructed, until these have arrived at such dimensions as an 18 in. main drain for a town of 10,000 inhabitants. The rain-fall was still to be relied on to a certain extent for flushing purposes, but a supplementary assistance was to be given at some points by flushing with water from the ordinary regular supply of the town. As these smaller drains were not sufficient to carry off all the surface and rain-water, as well as the sewage, overflow weirs have been provided at certain points, where the excess must go over, and pass away into some other channel. This is the system now most generally adopted, and is better than its predecessors; but it is now decided that it, in its turn, must give way to something better, and the change has commenced. The necessity of dealing with the sewage at the main outfall, and the utilization of it for agricultural fertilization, while, in nine cases out of ten, pumping must be employed to lift the sewage of a town at the discharging point for such a purpose, have gradually forced upon us the conviction that the sewage and household water must be kept quite distinct from the surface-water, subsoil water, and rain-fall.

The outfall of the sewage drain, and subsequent disposal of the filth, are in reality the first things to be considered. Hitherto, engineers in general have taken the nearest stream, and polluted it to such an extent, that perpetual law-suits, nuisances, and diseases have been the result. Fever of the worst class is certain to follow the drinking of water tainted in this manner, and there is scarcely a stream in the interior of the country which has not been injured more or less from this cause.

Again, where the sewage has been emptied into the sea, tide-locked drains are objectionable, and the sewage, when mixed with salt water, generally gives off more stench than ever. We may briefly say that all attempts at deodorization by chemical processes have hitherto failed, and as far as our present knowledge goes, are not to be relied upon. The utilization of the sewage on the fields by irrigation is, therefore, the true solution of the problem, and we must arrive at the simplest, cheapest, most certain, and most perfect system of accomplishing this. When sewage and rain-fall all go together in the same drains, as they do in all the older systems, all is uncertainty; while when the two are separated, rain and surface-water can be discharged at any point into the natural water-courses of the country, and a fixed quantity of sewage, with household and flushing water, would be passed to the main outlet, to be there dealt with. The opponents of this system say that it is too expensive and troublesome to plan; that it is unnecessary, as it is sufficient if engineers provide for the dry-weather flow of the sewage, and use that for irrigation; and that when the overflows come into action in floods, the whole is so much diluted, that no harm is done to any one. The advocates of this double system of drainage have proved that the total separation of the two is the most sanitary system, because the street-gratings and rain-water pipes, which at present let down the rain-water into the sewage drains, act, in fact, as so many ventilating shafts, and discharge the stench in the midst of the inhabitants; while, under a separate system, the sewage-pipe would be entirely sealed up, and only ventilated at such places as could safely be done; that the rain-water as a flushing power ought to be entirely discarded, as it fails in dry weather, just when it is most wanted; that in wet weather, and winter again, when the discharging of the sewage on to the surface of land is carried out, the great quantity of water sent down through the drains by the present system is agriculturally a serious injury; that when pumping has to be employed for lifting the liquid for irrigation, as it is in most cases, all is uncertainty, and that no machinery can be economical and efficient under such circumstances, and that the planning of the irrigation also becomes difficult to manage, and irregular. With regard to the expense, it has been proved that, as the rain-water and surface-water can be discharged at the nearest point, all the drains may be much lessened in size; and further, that the flushing power of the water in the sewage drains will be much more efficient, while the corresponding lessening of the expense in carrying out the process of utilization will completely compensate any additional outlay that may be incurred in laying the drains in towns. If we take the case, which is a common one, of a pop. of 10,000 people living upon a sq.m., the first-mentioned system, where rain and sewage-water go together, would require pumping machinery, in dry weather, of, say, five horse-power, to lift the liquid; and it would further be necessary, for wet weather, to have in reserve a lifting power of 150 horses; while, on the separate system, where the sewage alone would have to be dealt with, the five horse-power engine would be regularly and constantly employed, and its work would be almost entirely confined to the daytime, whereas the other must be ready at any time, and for every emergency. The system of sending sewage and rain-water together has been hitherto adopted in all towns; but except in one or two cases where gravitation has been available to utilize the discharge from the drainage, all engineers have failed to prevent the pollution of rivers, and it is obvious that something else must be tried, as that cannot be permitted to go on much longer. The system of separating the sewage and rain-water has been carried out in several large asylums and public buildings, many barracks, the town of Eton, and Windsor castle—where every consideration, both of expense and sanitary influence, was brought to bear on the subject. Reading, Oxford, and several other towns are fast

following on the same principles, and the results are hitherto most satisfactory. Great economy has resulted from the process.

4. *The Utilization of Sewage.*—The whole of the sewage of a house or town having been conveyed away in the manner we have described, the next important step is to know what to do with it. Above all things, it is desirable to add to the productiveness of the soil, so as to compensate in some degree for the constant supply we are drawing from that source.

The liquid nature of sewage, adopting as we may the ordinary amount of dilution in dry weather at the rate of 25 gals. per head, has been a great obstacle in the way; while also the vast quantities of road-grit, and the great gluts of rain that come down along with the sewage when there is only one system of drains in a town, have upset all arrangements and calculations. Many attempts have been made, especially at Leicester, some years ago, to precipitate all the valuable qualities of the sewage by impregnating the whole with milk of lime; but the process was unremunerative to those who did it, as so much sand was precipitated at the same time, that the product obtained was almost worthless as a manure; while, as the greater part of the ammonia escaped in the water, the discharging of it into any stream was still, strictly speaking, quite illegal. As far as chemical knowledge can guide us, there seems at present to be no hope in this direction.

At Edinburgh, again, and at Croydon, the irrigation of land by gravitation has rendered the process a simple one, because the whole has been poured over the land with many excellent results. These, however, are clearly exceptional cases, and we must look to pumping as being necessary in by far the greater proportion of towns; while for the two places we have mentioned, the results would, in all probability, have been better still if the strength of the sewage had been more concentrated. Agriculturally speaking, any dilution above 25 gals. per head of the population is not desirable, but is injurious and expensive to distribute; while, again, human fecal matter is too strong to be applied to land unless diluted in something like 10 gals. of water. The Chinese teach us an important lesson in this respect. They place all the solid matter, when they remove it from the towns, in small wells in their fields, and then take a scoopful and mix it in about ten or twelve times its volume of water before they apply it to their crops. If any one attempts utilizing sewage when mixed with rain-water, and has to pump the whole all the year through, he will find himself in endless difficulties.

Presuming, then, that we can arrive at a fixed quantity of 20 gals. per head of the population, or what may be taken as the dry-weather flow of the drainage from a town, the first step is to pass the whole through a strainer, so that all materials may be intercepted which will be likely to interfere with the pumping, or choke the smaller pipes used for irrigation. This is necessary, also, because in its unstrained state we cannot depend upon sewage going down and up again, and so passing over a valley, and the sphere of operations then becomes more limited.

Great part of the solid matter can also be removed by this process, and common house-ashes are the best mixing and deodorizing material to facilitate the stuff being carried away.

A piece of land should then be sought out, with a slope, if possible, of 1 ft. in 30 at least, and the filtered liquid, which will be full of strength, conveyed either by pumping or gravitation to the highest point of that land. Iron pipes should not be used, if possible; and when the land is very flat, it must be ridged and leveled. From the highest point of the land selected, the liquid must be conducted by open channels or through common drain-pipes laid on to the surface to all the different points where it is wished, and utilized for irrigation. The land adopted should be moderately porous, and then for every 100 people an acre may be allowed, but this varies much according to the nature of the soil. The land must be thoroughly drained and prepared. The best crops to be grown are Italian rye-grass, with alternately crops of vegetables, such as potatoes, cabbages, rhubarb, mangold. All these will luxuriate on the liquid, and we think we may safely say that the command of such liquid would be worth to any person from £5 to £10 an imperial acre, according to local circumstances.

Milk cows thrive remarkably well on this grass, and it has been proved by chemical analysis that the milk is of the best quality, while the vegetables are also quite wholesome.

Could such a system be carried out in the neighborhood of all our large towns, the results would be highly beneficial. The difficulties in the way, principally arising from ignorance on the subject, have been great; but to this system, or something like it, there can be no doubt, before many years, we must come, to prevent pollution of the rivers, and to make the most of the sources of fertility which are at our command, but which we are at present recklessly wasting. Many committees have been appointed by the house of commons to inquire and take evidence on this subject. In 1857 a commission was issued by the crown to certain gentlemen, at the head of whom was lord Essex, to inquire into "the best mode of distributing the sewage of towns, and applying it to beneficial and profitable uses." This commission went to work principally at Rugby, and made a vast number of experiments, the general result of which may be stated to be, that ordinarily diluted sewage may be said to produce such increased crops as to warrant an agriculturist in giving one halfpenny a ton for it, a ton of water containing 224 gallons.

The third report was issued in April, 1865, and the following recommendations are given as the results of their labors:

"1. The right way to dispose of town-sewage is to apply it continuously to land, and it is only by such application that the pollution of rivers can be avoided.

"2. The financial results of a continuous application of sewage to land differ under different local circumstances; first, because in some places irrigation can be effected by gravity, while in other places more or less pumping must be employed; secondly, because heavy soils (which in given localities may alone be available for the purpose) are less fit than light soils for continuous irrigation by sewage.

"3. Where local circumstances are favorable, and undue expenditure is avoided, towns may derive profit, more are less considerable, from applying their sewage in agriculture. Under opposite circumstances, there may not be a balance of profit; but even in such cases a rate in aid, required to cover any loss, needs not be of large amount. Finally, on the basis of the above conclusions, we further beg leave to express to your lordships that, in our judgment, the following two principles are established for legislative application: First, that wherever rivers are polluted by a discharge of town-sewage into them, the towns may reasonably be required to desist from causing that public nuisance. Second, that where town-populations are injured or endangered in health by a retention of cesspool-matter among them, the towns may reasonably be required to provide a system of sewers for its removal; and should the law as it stands be found insufficient to enable towns to take land for sewage-application, it would, in our opinion, be expedient that the legislature should give them powers for that purpose."

It is obvious, however, to any one perusing the above paragraphs, that they are exceedingly vague, and form but little guide to any one who must go into the question of whether money invested in utilization of sewage-schemes will pay an adequate return upon the outlay. The uncertainty attending the dilution of the sewage; the necessity of making the earth take it at all seasons; the distance that the liquid has to be pumped—have all been such difficulties in the way, that the commission could not well arrive at any other result than they have done.

Experience has now proved, what was formerly a matter of presumption, that, until we arrive at fixed quantities, no reliable principles can be laid down that would in all cases enable us to overcome the difficulties attending the sanitary management and utilization of sewage.

SEWAGE, LIERNUR SYSTEM OF. The pneumatic system of capt. Liernur for dealing with the sewage of a town has been in operation for some years on the continent; and Amsterdam, Leyden, Prague, Dordrecht, St. Petersburg, and some other towns, are now either partly or wholly drained on this plan. A town so drained is divided into districts of from 250 to 1000 acres, according to circumstances. Each of these districts is again divided into small sewage areas varying from 10 to 50 acres, also according to local circumstances. These small areas have each an air-tight cast-iron tank, from which extend along the several streets air-tight pipes of the same material, 5 in. in diameter, and independent of each other. The closets of the houses are connected by branches with these pipes.

An air-pump engine, or more usually two or three of these steam-engines, are placed in some central station, and in the under portion of the building air-tight iron reservoirs are situated, in which a vacuum of about $\frac{1}{4}$ atmospheric pressure is maintained. Pipes, also air-tight, and called central pipes, connect these reservoirs with the street tanks. Like the outer series, these are 5 in. in diameter, and each pipe has two connections with its street tank, by one of which only air can be sucked out; but the other dips into the well of the tank, thus enabling its contents to be removed by suction to one of the central reservoirs. When a vacuum is made in one of the street tanks, the contents of the closet pipes are drawn toward it; and on a second vacuum being created, the charge is drawn into it. This tank is then in due time emptied into a central reservoir by exhausting the air in the pipe connecting them.

We may state here that, although no water is used for flushing it is found that the fecal matter is reduced almost from the first to the consistency of thin pulp by the atmospheric pressure. Now as it is impossible to propel liquid any great distance along a horizontal tube simply by air-pressure—the air column always breaking through and destroying the vacuum—the pipes require to be set at inclines varying from 1 in 5 to 1 in 250 according to circumstances. This admits of a series of vertical risers being formed from which the liquid matter can never be altogether removed, and therefore these form a complete lock-off of one gradient from another, so that the vacuum cannot be destroyed. The residual liquid in these risers corresponds to the left quantity of water which a pump can never completely remove from a receptacle. When the apparatus is at rest, this minimum quantity of liquid matter arranges itself partly in the riser and partly in the lower end of the sloping pipe.

To show what takes place when there is a much larger amount of excreta to remove in one direction than in another, we may take the case of two branches from one main pipe each 100 ft. long, the gradient 1 in 100, and each having a riser of 1 foot. One of these pipes may have to deal with a single house producing only 1 ft. of fecal matter; the other may be connected with a barrack producing 100 times as much. "We have,

therefore, in the barrack pipe a mass filling both pipe and riser, and ready on the slightest force to discharge into the main or street pipe. On the other hand, in the branch pipe of the single family, there is the minimum quantity collected at the foot of the riser. The sucking action is now put in operation in the main pipe. The pressure of the atmosphere begins to act, and the barrack pipe rapidly discharges into the main pipe, while the smaller quantity is simply climbing up the riser, and before it has got to the top of the riser to be in a position to discharge, all the surplus quantity in the barrack pipe is gone, and that which is left is simply equal to that minimum which cannot be withdrawn. In this way the fullest pipe always begin to discharge first, the next more full waiting for it, and so on, until the minimum is reached, when simply air breaks through."

During the day the air-pumps maintain a vacuum in the central reservoirs and throughout the whole extent of the central pipes connected with them. Patrols of two men each visit the district tanks, one of whom, by opening a valve, makes a tank communicate with the central pipes, and so exhausts the air from it. He then shuts the valve, and the second man immediately opens another which allows the vacuum to act on one of the street pipes and its branches. A second, third, and fourth street pipe is dealt with in the same manner—the vacuum meanwhile being frequently renewed in the tank—till all the sewage in a district is collected and transferred to a central reservoir.

The pneumatic system of Liernur admits of ordinary water-closets being used. As, however, the water has afterward to be got rid of, he prefers, on the score of economy, a form of closet devised by himself which is used without water. It has no movable mechanism at all. The space into which the excreta falls is one arm of a short bent tube or siphon trap discharging into a soil-pipe. Each new deposit by its own weight forces out the former one, and there are special arrangements for the ventilation of the closet.

Capt. Liernur aims at making the sale of the fecal manure cover the working expenses of the system. The process, or at least one process, by which he converts the sewage material into a marketable manure, is as follows, leaving out some of the minor arrangements for saving heat. Mixed with a little sulphuric acid, it is placed in a large boiler through which pipes pass, and through these pipes waste steam, after being superheated, circulates, by which a rapid boiling takes place. The material is afterward transferred to a trough in which a long hollow drum of thin metal, heated internally, revolves. The drum takes up and dries a thin layer of the manure, which is scraped off by a fixed knife and sold under the name of *poudrette*. It contains from 7 to 10 per cent of ammonia, and it is affirmed that this method of converting the liquid manure into a dry powder is highly remunerative.

We need hardly explain that wherever the Liernur system is adopted, the mere water drainage such as that required for rain, waste water of houses, and the like, is provided for by separate drains formed of earthenware pipes, but of much smaller size than in cases where all kinds of sewage pass through them. Existing sewers in a town may of course be used for this purpose.

The details of the Liernur system have been so recently brought to much perfection, that we shall probably have to wait for some years yet before any decided opinion can be formed of its merits as compared with other methods of treating sewage. As yet no sanitary engineer has adopted it in England even on a small scale, but if it succeeds on the continent no doubt any existing prejudice against it will soon be overcome.

SEWAGE EARTH-CLOSET. In addition to the arrangements noticed under SEWAGE, and under SEWAGE, Liernur's System of, for getting rid of excreta, there is partially in use an *earth-closet*, in which the powerful deodorizing and other properties of dry earth are taken advantage of to deprive refuse of offense or harm, and to retain it in a fit condition for agricultural use. There are numerous forms of this kind of closet. Perhaps the simplest kind is that which consists of nothing more than a seat and a pan, the latter being lined round with earth by the help of a movable central mold or core. More convenient forms consist of a pail or a square-shaped pan on wheels under the seat, and an earth-box rising above it at the back. The box may be made to hold as much earth as serves for twenty or thirty sittings. By one of several devices in use, a valve is opened at the bottom of the earth-box, which allows the proper quantity of earth to descend through a spout and cover the deposit. The mechanism of one kind is such that the seat descends with the person, thereby bringing a charge of earth to the bottom of the spout, and when he rises it is dropped upon the faeces.

The earth-closet system is, of course, scarcely practicable in large towns, as it would be very difficult to plan an economical arrangement by which the large quantities of earth required could be carried to and fro. But it is in use in many villages, and in some large isolated buildings, such as jails and hospitals. It has been much adopted in India, where, owing to the warmth of the climate, the rendering of fecal matter innoxious from the first must give it a peculiar advantage. It also appears to have been tried on a considerable scale in America; and a competent authority there reports that "experience has taught that its power for usefulness is restricted by the difficulties involved in procuring, preparing, and removing the dry earth required in its use, and

to some extent by those which attend, mechanically and chemically, the application of the earth to the dejecta. The inherent defects of the earth-closet reside in the seeming impossibility of obtaining just such perfection of mechanism as will completely do the required work automatically. It is not applicable to our large towns on account of the large quantity of earth required," as one hundred pounds of earth per week would be required for a household of six persons. Sewerage in the great towns is advancing more generally than the earth-closet system.

SEWALL, JONATHAN, LL.D., 1728-96; b. Boston; graduated at Harvard, 1748; taught school in Salem; practiced law in Charlestown; appointed atty.gen. of Massachusetts, 1767. In 1769 he commenced suit for the freedom of a colored man, James vs. Richard Lechmere of Cambridge, which he gained in 1770, 2 years before the celebrated Somerset case. At the beginning of the revolutionary war he resided at Cambridge, in the Vassal house, subsequently Washington's headquarters. He went to England, 1779. From 1788 to his death he was judge of the vice-admiralty court at St. Johns, New Brunswick.

SEWALL, JOSEPH, D.D., 1688-1769; b. Boston; graduated at Harvard college in 1707; ordained in 1713 colleague pastor of Old South church, Boston, where he remained till his death, having declined the presidency of Harvard in 1724; was corresponding member of the society in Scotland for promoting Christian knowledge.

SEWALL, SAMUEL, 1652-1730; b. England; came with his father to America at the age of nine; graduated at Harvard in 1671; preached for a short time; obtained great wealth by his marriage in 1676; went in 1688 to England; returned in 1689; in 1692 appointed one of the council, holding the office till 1725; was a judge, 1692-1718, when he was made chief-justice. Sharing in the general belief in Europe and America concerning witchcraft, he concurred in the condemnations in 1692; but in 1697 made a humble public acknowledgment of his error. He contributed liberally for the spread of the gospel among the Indians. In 1699 he was chosen one of the commissioners of the society in England for the propagation of the gospel in New England, and was their secretary and treasurer. He was for many years a member of the Old South church and held in high esteem. He published *Answer to Queries respecting America; Accomplishment of Prophecies; A Description of the New Heavens*. His diary and other papers are in possession of the Mass. historical society.

SEWALL, SAMUEL, LL.D., 1757-1814; b. Boston; great-grandson of the chief-justice and grandson of Joseph, D.D.; graduated at Harvard college, 1776; studied law and for many years practiced in Marblehead. In 1800 he became judge of the supreme court, and in 1813 was made chief-justice.

SEWARD, a co. in s.w. Kansas, having the territorial line of the Indian territory for its s. boundary; 650 sq.m.; pop., '80, 5--3 of American birth. It consists of a level fertile plain destitute of timber.

SEWARD, a co. in s.e. Nebraska, drained by the Big Blue river, and its n. middle, and s. forks, on the Nebraska railroad; 576 sq.m.; pop., '80, 11,147--9,185 of American birth. The surface is rolling. The soil is productive. Corn, wheat, and oats are the staples. Co. seat, Seward.

SEWARD, FREDERICK W., son of Wm. H.; b. N. Y., 1830; graduated at Union college, 1849; admitted to the bar, 1851; associate editor of *Albany Evening Journal* until 1861; assistant secretary of state, U. S., 1861-69, and again under the administration of president Hayes.

SEWARD, WILLIAM HENRY, American statesman, was born at Florida, N. Y., May 16, 1801, of Welsh and Irish descent. His father was a physician and merchant, who, after accumulating a moderate fortune, was appointed judge of one of the inferior courts. Seward entered Union college at 15; in 1819 he visited the south, and was engaged for six months as a school-teacher in Georgia. Called to the bar in 1822, he settled at Auburn, western New York, and became the partner and son-in-law of judge Miller. In 1825 his political abilities were manifested in an oration delivered at Syracuse, and in 1828 he was chosen president of a state convention. At this period New York was the center of a wide-spread excitement against free-masons, and Seward as a leading anti-mason, was elected to the state senate. In 1833 he visited Europe, and wrote a series of letters, which were published in the *Albany Evening Journal*. In 1834, he was a candidate for the office of governor of New York, but was defeated by the democratic candidate. About this time he received the lucrative appointment of agent of the Holland Land company, which gave him wealth and influence. In 1838 he was elected governor of New York. In this position he recommended the increase of education, internal improvements, a liberal policy toward foreign immigrants, and took the side of abolition in the growing controversies on slavery. In 1849 he was elected to the senate of the United States, where he became the acknowledged leader of his party, and in the debate on the admission of California he promulgated what was called his "higher-law" doctrine, in saying that there was "a higher law than the constitution which regulated the authority of congress over the national domain—the law of God, and the interests of humanity." In a speech at Rochester, N. Y., in 1858, he declared that there was "an irrepressible conflict

between opposing and enduring forces," and that "the United States must become either entirely slave or entirely free." In 1859 he revisited Europe, and extended his tour to Egypt and the Holy Land, and in 1860 was the most prominent candidate of the republican party for nomination for the presidency; but personal and local interests finally secured the election of Abraham Lincoln, while Mr. Seward accepted the important post of secretary of state, in which he guided the diplomacy of the federal government through the perils of the war of secession with an almost unparalleled industry, energy, and success. On the 14th of April, 1865, as the war approached its termination, and while Seward was confined to his room by a fall from his carriage, president Lincoln was assassinated by John Wilkes Booth, an actor at a theater in Washington. At the same time another assassin named Paine, penetrated to the room of Mr. Seward, dangerously wounded his son, and with a poniard inflicted wounds upon him which were at first believed to be fatal, but from which he slowly recovered, and continued in office as secretary of state for foreign affairs, throughout the presidency of Lincoln's successor, Andrew Johnson, when he conducted the negotiations by which the United States purchased from Russia those territories in North America which are now called Alaska. Seward resigned his office in 1869, on the accession of president Grant. In the autumn of 1871, he went on a foreign tour through southern Europe, Turkey, Palestine, Egypt, India, China and Japan, and was everywhere received with much distinction. Seward published speeches and orations in 4 vols., a *Life of John Quincy Adams* and a *Life of De Witt Clinton*. He died in October, 1872.

SEWARD, WILLIAM HENRY, LL.D. (*ante*), 1801-72; b. N. Y. Mr. Seward was the senior member of what Horace Greeley termed the firm of "Seward, Weed & Greeley," which from 1839, when it succeeded in breaking down the "Albany regency," until 1854, when Mr. Greeley withdrew, controlled politics in the state of New York, dispensed patronage, and even swayed nominations, and in at least two instances elections of presidents of the United States. This extraordinary political combination was chiefly the motive-power which placed Mr. Seward in positions where his undoubted ability, profound and comprehensive knowledge of men, and shrewdness and diplomatic skill could gain their best opportunity. His finest acts of statesmanship were undoubtedly his management of the *Trent* imbroglio, which threatened war with Great Britain; his dignified and determined action in the case of the French invasion of Mexico; and his purchase from Russia of the territory of Alaska, an act of judgment and foresight whose full value is already beginning to be appreciated. He was a relentless anti-mason, and a bitter opponent of the American or know-nothing party in 1855. He supported Mr. Fremont for the presidency in 1856, and did active work toward electing him, but without success. In 1860 he himself was so well thought of for the presidency, that in the republican convention he received 173½ votes on the first ballot, the highest number; being defeated, however, for the nomination by Mr. Lincoln. The account of Mr. Seward's journey in 1870-71 was published in 1873, edited by his adopted daughter, Olive Risley Seward, and entitled *William H. Seward's Travels Around the World*. His latest published oration was that delivered at Sitka, Aug. 12, 1869. Mr. Seward was remarkable for the ability to crystallize thought in felicitous phrases, which was possessed in so marked a degree by the late lord Beaconsfield. His "irrepressible conflict" and "higher law" were expressions which gave a character to the history of his time.

SEWELLEL, *Aplodontia leporina*, Rich., an animal of the size and general appearance of the musk-rat, having the peculiarity of rootless molar teeth. It has a reddish-brown color, small eyes, short tail, strong jaws, and a plump body. It inhabits the n.w. coast of North America, particularly the region of Puget's sound. The natives use the skin as an article of dress. The animal lives in families or herds and makes extensive burrows.

SEWING-MACHINE, one of the most important inventions of this century. Like the stocking-frame, which in principle it closely resembles, we owe it to the ingenuity of a poor mechanic, striving to lessen the labor which he saw was a real hardship upon his wife and other poor women. Elias Howe, a native of Massachusetts, surrounded by a young family, for whom he was obliged to labor during the day, devoted his after-hours to the construction of a sewing-machine. This was about the year 1841, and his career since that period up to the present time forms a striking chapter in the annals of intelligent labor, and furnishes another proof of the saying that "fact is stranger than fiction." After incessant labor, during the latter part of which he and his family were indebted to a friend for the means of subsistence, he completed the first working sewing-machine, the patent for which was granted to him in May, 1841. He did not succeed in inducing the people of his own country to see the value of his patent, and came to England, where, after patenting it here also, he met with so much discouragement that he sold the patent for £250 and a royalty of £3 per machine to a staymaker, Mr. Thomas of Cheapside, London, who used it successfully in his own business, but did so little toward making it public that for several years its existence was only known to a very few individual manufacturers. When Howe reached his own country again, he found his American patent pirated by a wealthy company; but with admirable spirit he asserted his rights, and succeeded in establishing them; and it is gratifying to know that his talent, industry, and perseverance were rewarded, for he became a wealthy man.

Howe's machine worked what is called the lock-stitch, but since his invention became known numerous improvements and modifications have been introduced by other inventors. The principal of these are as follows: 1. *Machines which sew with one thread*; of which one kind makes the *through-and-through* or *shoemaker's stitch*, the thread being held and pushed through with pincers, one pair on each side of the material to be sewn. The needle is pointed at each end, and being pushed through by the pincers on one side, is taken hold of by the corresponding pair on the other, and the thread is thus pulled through backwards and forwards. Only a small length of thread can be used by this machine, hence it is of but limited application. 2. Another single-thread machine makes the *running-stitch*. In this, the needle is stationary, and receives a continuous supply of thread from a reel; two small-toothed wheels are so arranged that their teeth, pressing into one another, crimp the two pieces of cloth, and push them forward against the point of the needle, which, as it gets filled, is relieved by the operator, who keeps drawing the sewn cloth off at the eye-end of the needle. This machine answers admirably in cases where loose tacking is required. It is the invention of an American of the name of Bostwick, who introduced it into England in 1844. 3. The *chain* or *tambour stitch* is also a single-thread stitch, the machine for which was invented by M. Thimmonier, a French man, in 1848. In this, the thread is looped upon itself by means of a curved shuttle after it has passed through the cloth.

This kind of stitch, though very useful for some kinds of work, is easily pulled out. 4. Wheeler & Wilson's sewing-machine, another American invention, has acquired the greatest reputation in Great Britain. It is a double-thread machine, and besides the vertical eye-pointed needle, has a curved shuttle or hook (fig. 1, *a*) working below, with a revolving reel, *b*, inside its curve. The reel is of metal, each side being convex externally; and so adjusted on the axle, that the edges are so near together as to admit only one thickness of the thread to pass through (fig. 2). The side view of the whole arrangement is seen in fig. 3.

FIG. 3.

FIG. 1.

FIG. 2.

It fits easily within the nearly circular hook, and gives off its thread as required. The thread passes partly round the outer edge of the hook upon a slightly-grooved bevel (*a*, fig. 3), which forms a loop, and passes it between the needle and the thread which it carries with it in descending; the loop is held in position as the needle ascends, and the cloth being moved on, the next descent of the needle takes it through the loop and receives another below it, which renders the first one tightly locked. For such work as male and female dressmaking generally, this kind of machine is at present unrivaled, both for the efficiency of its work, and also for the neatness and finish of the machines made for private use. Sewing-machines have been patented in America and England by another American named Blake for sewing the soles on boots and shoes; and so rapid are they in their work, that it is said during the war in the United States as many as 150 pairs of soles have been sewed on army boots in one day by a single machine. Special sewing-machines are also in use for sewing the upper leathers of boots and shoes, for gloves, for embroidery, and various other purposes.

SEXAGESIMA SUNDAY (Lat. *sexagesima*, i.e., *die*s, the 60th day), the second Sunday before Lent, and roughly reckoned the 60th day before Easter.

SEXAGESIMAL, a mode of arithmetical calculation introduced by the ancient Greek astronomers, especially by Ptolemy (q.v.), into astronomical and geometrical reckoning. It was founded upon the division of the circle into 360 parts, and, the radius being nearly $\frac{1}{2}$ of the circumference, was considered to contain 60 of these parts or degrees. Continuing the same mode of subdivision, each degree (°) on the radius was divided into 60 minutes (′), each minute into 60 seconds (″), and thirds (″′), fourths (″″), etc., followed in the same relation to each other. Addition and subtraction are not altered in this method, but multiplication, division, and the extraction of roots are so to a considerable extent. Multiplication, the most used of these three operations, was carried on in the descending scale, as in the following example, where $\lambda\alpha^{\circ}\delta^{\prime}\kappa^{\prime\prime}$ is to be multiplied by $\alpha\theta^{\circ}\eta^{\prime}\nu\delta^{\prime\prime}$, or (substituting Arabic numerals) $31^{\circ}4^{\prime}27^{\prime\prime}$ by $29^{\circ}18^{\prime}54^{\prime\prime}$:

$$\begin{array}{r}
 31^{\circ} \quad 4^{\prime} \quad 27^{\prime\prime} \\
 29^{\circ} \quad 18^{\prime} \quad 54^{\prime\prime} \\
 \hline
 899^{\circ} \quad 116^{\prime} \quad 783^{\prime\prime} \\
 \quad 558^{\prime} \quad 72^{\prime\prime} \quad 486^{\prime\prime\prime} \\
 \quad \quad 1674^{\prime} \quad 216^{\prime\prime\prime} \quad 1458^{\prime\prime\prime\prime} \\
 \hline
 899^{\circ} \quad 674^{\prime} \quad 2,529^{\prime\prime} \quad 702^{\prime\prime\prime} \quad 1458^{\prime\prime\prime\prime} = 910^{\circ} \quad 56^{\prime} \quad 21^{\prime\prime} \quad 6^{\prime\prime\prime} \quad 18^{\prime\prime\prime\prime}
 \end{array}$$

Here, each of the three numbers, 31, 4, 27, is multiplied by 29; the same three by 18, and the results placed in the line below, one step to the right; and again by 54, and the results placed another step to the right. This arrangement proceeds on the principle that the product of degrees by minutes gives minutes; of minutes by minutes, seconds; of minutes by seconds, thirds; and, in general, the denomination of a product is indicated by the sum of the marks superposed on the two factors. The columns are added and rearranged by reduction (q.v.). This system, though clumsy and intricate, was a great improvement, as regards facility and accuracy, on the former Greek method; and so much was it admired that succeeding geometers founded on it a complete system of general calculation, and a work on sexagesimal computation was written by Barlaam, who died in 1348. It is almost unnecessary to state that the terms minutes, seconds, thirds, etc., here employed only denote sixtieths, sixtieths of sixtieths, etc., and have no other signification; further, that the degrees, minutes, and seconds in the multiplier are, for the time being, merely abstract units and parts of units. The operation of modern arithmetic known as *duodecimal multiplication* is effected in the same way, the subdivisions being twelfths in place of sixtieths.

SEXTANT, an instrument for measuring the angular distance of objects by means of reflection. The principle of its construction depends upon the theorem, that *if a ray of light suffer double reflection, the angle between the original ray and its direction after the second reflection is double that of the angle made by the reflecting surfaces*. Thus let A and B (fig. 1) be two mirrors perpendicular to the same plane, and inclined to each other, and let SA be a ray of light, which falling upon A is reflected on B, and re-reflected in the direction BC, then ACB is the angle between the original and finally reflected rays, and ADB is the angle between the mirrors. Now, as the angle of reflection is equal to the angle of incidence $\angle SAF = \angle BAD$, and $\angle GBA = \angle DBC$; but $\angle EBC = \angle BAC + \angle BCA = (\angle BAD + \angle DAC) + \angle BCA = (\angle BAD + \angle SAF) + \angle BCA = 2 \angle BAD + \angle BCA$; and $\angle EBC$ also $= \angle EBD + \angle DBC = \angle EBD + \angle GBA = 2 \angle EBD = 2 \angle BAD + 2 \angle BDA$; therefore $\angle BCA = 2 \angle BDA$, which proves the truth of the theorem. The instrument of which this theorem is the principle is a brass sector of a circle

FIG. 1.

in outline; the sector being the sixth part of a complete circle, for which reason the instrument is called a *sextant*. Fig. 2 shows the essentials of its construction; AMN is the sector whose curved side, MIN, is the sixth part of a circle; A is one mirror wholly silvered, placed perpendicular to the plane of the sector, and on, and in line with, the limb AI, which is movable round a joint at or near A; B is the other mirror, also perpendicular to the plane of the instrument, and silvered on the lower half only, the upper half being transparent; E is an eye-hole or small telescope. The graduation runs from N to M (on a slip of silver, platinum, or gold let into the rim), and is so adjusted that when the movable limb is drawn toward N till the mirrors A and B are parallel, the index, which is carried at the foot of the movable limb, is opposite zero on the graduation. If we suppose that this zero-point is at N, it is evident that the angle between the mirrors is equal to the angle NAI; and again, if instead of graduating from 0° at N to 60° at M, which is the proper graduation for the sixth part of a circle, the graduation be made from 0° to 120°, that is, each half-degree being marked as a degree, and similarly of its aliquot parts, then the angle NAI, read off by the index at I, will show at once the angle between

the incident and finally reflected rays. The mode of using the sextant consists in placing the eye to the telescope or eyelet hole, and observing one object directly through the

unsilvered part of B, and then moving the index till the image of the other object, reflected from A upon the silvered part of B, coincides with, or is opposite to the first object, then the angle, read off at I, gives the angle between the objects. For additional accuracy, a vernier is attached to the foot of the movable limb.

The sextant is capable of very general application, but its chief use is on board ship to observe the altitude of the sun, the lunar distances, etc., in order to determine the latitude and longitude. For this purpose it is necessary to have stained glasses interposed between the mirrors A and B, to reduce the sun's brightness. These glasses (generally three in number) are hinged on the side AM, so that they may be interposed or not at pleasure. B is the glass through which the horizon is perceived, and has hence received the name of the *horizon-glass*; while the other mirror, from its being attached to the index-limb, is called the *index-glass*.

The sextant is liable to three chief errors of adjustment; 1° if the index-glass be not

FIG. 2.

perpendicular to the plane of the instrument; 2° if the horizon-glass be not perpendicular to the plane of the instrument; and 3° if, when the mirrors are parallel (which is the case when a very distant body, such as the sun or moon, is observed directly through B, and found to coincide with its image in the lower part of B), the index does not point accurately to 0° ; this last is called the *index-error*, and is either allowed for, or is remedied by means of a screw, which moves the index in the limb AI, the latter being stationary. The first two errors are also frequently remedied by means of screws working against a spring, but in the best instruments the maker himself fixes the glasses in their proper position.—The *quadrant* differs from the sextant only in having its arc the fourth part of a circle, and being consequently graduated from 0° to 180° ; the *octant* contains 45° , and is graduated from 0° to 90° ; while the *repeating-circle*, which is a complete circle, is graduated from 0° to 720° . A common form of the sextant is the "snuff-box" sextant, which is circular in shape, and as it can be conveniently carried in the pocket, is the form most frequently used by land-surveyors.

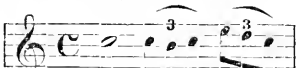

The idea of a reflecting instrument, on the principle of the sextant, was first given by Hooke about 1666; but the first instrument deserving the name was invented by John Hadley (q.v.) early in the summer of 1730, and a second, and much improved form of it, was made by him a short afterward. Hadley, at a meeting of the royal society, claimed for Newton the priority of invention; and in Oct., 1730, a Philadelphian, named Godfrey, also asserted his claim as the original inventor, but that learned body decided that Newton's claim was unsupported by even probable evidence, and that Hadley's and Godfrey's inventions were both original, but that the second form (which is almost the same as the common sextant now employed) of Hadley's instrument was far superior to his first form and to Godfrey's.

SEXTON (corrupted from SACRISTAN, q.v.), is a parochial officer in England, whose duty is to take care of the things belonging to divine worship. He is usually chosen by the inhabitants, but often also by the minister or the churchwardens, the mode of appointment being regulated by the custom of each parish. He sometimes also holds the office of parish-clerk. Women have occasionally been appointed sextons, this being one of the offices which women may fill, and they also have a vote in elections. The office is a freehold office for life, except in the new parishes under church-building acts; the duty is to keep the church clean, swept, and adorned; to open the pews; to make and fill up the graves; to prevent any disturbance in church. The salary is paid by the churchwardens, and as to amount depends on custom. In Scotland the beadle performs similar duties, and is appointed by the heritors.

SEXTUPLET, in music. When a note is divided into six parts instead of the usual division into four—as, for instance, a minim into six quavers, or a crotchet into six semiquavers—the group is called a sextuplet, and the figure 6 is generally placed above it. The proper sextuplet is composed of three groups, of two notes each, being, in fact, a

triplet (q.v.), with each of its notes subdivided into two: 

But a group composed of two successive triplets is sometimes, though not very correctly, also called a sextuplet and written as such, though it is more correct to divide it

into its component two triplets thus: 

SEXTUS EMPIRICUS, lived in the first half of the 3d c., and connected himself with the school of the Empirics. He was a pupil of Herodotus of Tarsus who was probably contemporary with Galen. Nothing is known concerning his life, except that he was a physician, and of the school of the Empirics; but in his writings his philosophical opinions are sufficiently clear. His first work, the celebrated *Pyrrhonian Imaginations*, is a repository of the doctrines of the skeptics; his second, in 11 books, attempts to refute every item of positive knowledge that man has ever acquired. Both works combined furnish the best account extant of ancient skeptical thought and its methods of assailing all manner of opinions. Though occasionally sinking into mere dispute about words, Sextus generally hunts down with sharp and persevering pursuit every idea, real or supposed, and subjects it to skeptical distillations. Skepticism, he says, is the disposition to doubt of everything beyond mere phenomena, and he adheres rigidly to his definition. It surprises thinking men to find that the same problems which, 16 centuries ago, perplexed philosophers, are still tasking the brains and exciting the feelings of their successors, at the present day, and that essentially there is no new skepticism under the sun.

SEYCHELLES' COCOA-NUT, or DOUBLE COCOA-NUT, *Lodoicea seychellarum*, a palm, of which the fruit has some resemblance to a cocoa-nut, although it belongs to a different tribe of palms, being allied to the Palmyra palm. It is found only in the Seychelles islands; and the fruit, wafted by the winds to the shores of the Maldivé islands, or found floating in the Indian ocean, was long the subject of many ridiculous fables, and is still an object of interest and curiosity, and as such one of the minor articles of com-

merce. The free grows to the height of 50 or 60 ft., with a tuft of immense leaves. The wood and the leaves are used for a variety of purposes, like those of other palms. The "cabbage" or terminal bud is eaten. The fruit is often a foot or a foot and a half long, in shape like a melon, its outer husk green, the interior near the base divided into two parts, at first filled with a white sweet jelly, which changes into a white horny kernel. The shells are used for making vessels of various kinds, often beautifully carved and ornamented.

SEYCHELLES ISLANDS, situated nearly in the center of the Indian ocean, between $3^{\circ} 40' - 5^{\circ} 35'$ s. lat., and $55^{\circ} 15' - 56^{\circ} 0'$ e. long., a group of more than 30 isles, resting on an extensive bank of sand and coral, and forming the most important of the dependencies to the colony of Mauritius. The principal are Mahé, Praslin, Silhouette, La Digne, Curieuse, St. Anne, Aux Cerfs, Frégate, Marianne, Longue, and Du Sud Est. Mahé, the most considerable and populous of the group, and the seat of government, is 18 m. long, and from 3 to 5 broad. The islands are mountainous, often rising abruptly from the sea, and are clothed with the most luxuriant verdure; one of the peaks, named mont Blanc, in Mahé, attains an altitude of 3,000 feet. The principal port is Victoria, on the n.e. side of the island of Mahé, the houses of which used to be built chiefly of wood; but now coral is universally employed. Coral is growing very rapidly all round this group of islands. At fort Victoria, where the soundings were recently given at 7 fathoms, the coral has piled itself up to within $2\frac{1}{2}$ fathoms of the surface. In the neighborhood of fort Victoria there is a beautiful church built of coral. Many improvements have been made also in others of these small islands.

The Seychelles islands were known to the early Portuguese navigators, who bestowed on them the titles of *isles de Mascarenhas*; subsequently the French renamed them *îles la Bourdonnais*, and finally changed their appellation in honor of the count d'Hautville of Seychelles. They were first settled by the French in 1756, who commenced the cultivation of spices, under circumstances so favorable as to induce a belief in a lucrative competition with the more easterly colonies of the Dutch. The immunity of the Seychelles islands from the hurricanes which periodically visit the neighboring seas rendered them peculiarly suited for this purpose, which, however, received a severe blow by the suicidal destruction of the spice-plants by the French occupants, to prevent their falling into the hands of the English in 1778. The cultivation is now checked by insufficiency of labor. On the cession of Mauritius the Seychelles islands were finally taken possession of by Great Britain. The islands produce a large quantity of timber suitable for ship-building purposes; and the Seychelles cocoa-nut, which is indigenous only in the Seychelles islands, and the nuts, leaves, etc., of which are applied to a great variety of domestic purposes by the natives. Sugar is cultivated to a small extent. Cotton flourishes here, but its cultivation has declined since the abolition of slavery. The chocolate plant and vanilla are grown, and tortoise-shell is among the articles of commerce.

The population of the Seychelles islands, as taken at the last census (1871), was 11,082 souls, many of whom are employed in the ship-building yards and factories.—See sir Edward Belcher's *Account of the Seychelles; Voyage of H.M.S. Leven and Barracouta*, by capt. Owen, R.N.

SEYFFARTH, GUSTAV, D.D., PH.D., b. Uebigau, Saxony, 1796; studied at Leipsic university, where he was professor extraordinary of archaeology, 1825-55. Emigrating to America, he was professor in a Lutheran seminary in St. Louis, Mo., 1855-71. In 1857 he published at New York a *Summary of Recent Discoveries in Biblical Chronology, Universal History, and Egyptian Archaeology*, in English and German. His works in German and Latin are very numerous.

SEYMOUR, FAMILY OF. This family, whose history is largely interwoven with that of England, was originally settled at St. Maur—whence its name—in Normandy. Coming over to England, the Seymours obtained lands in Monmouthshire as early as the beginning of the 13th century. They acquired estates at Hatch Beauchamp, Somersetshire, by marrying an heiress of the Beauchamps early in the 15th century. In 1497 we find the head of the family, sir John Seymour, employed in suppressing the insurrection of lord Audley and the Cornish rebels, and subsequently accompanying king Henry VIII. to his wars in France, and to the field of the cloth of gold. Of the issue of this worthy knight one daughter became the wife of Henry VIII., and mother of Edward VI.; one son, Thomas, created lord Seymour of Sudley, became lord high admiral of England, and the second husband of Henry's widow (Catherine Parr), and ended his life on the scaffold, being attainted of high treason. Sir John's eldest son, Edward, who held many high positions in the court of Henry, was created lord Seymour of Hache, and duke of Somerset in 1546-47. He had been sent into France by Henry to settle the disputed question of the border of the English possessions there, and secured the confidence of the king so far that he was left by him one of his executors and one of the council of the young prince Edward. He was subsequently made lord high treasurer, and eventually "protector and governor of the King and his realms." (See EDWARD VI.) His subsequent fall, after a two years' tenure of his all but regal power by the influence of Dudley, earl of Warwick, and duke of Northumberland, was followed by an attainder of his honors, which was not reversed for more than a century.

The eldest son of the protector by his second marriage, being created by Elizabeth earl of Hertford, married the lady Catharine Grey, a grand-niece of Henry VIII., sister of the unfortunate lady Jane Grey—a marriage which entailed on him a long imprisonment and a heavy fine. His grandson, who succeeded him in the earldom of Hertford, was also sent to prison in the tower of London for marrying the lady Arabella Stuart, cousin of James I. of England; but subsequently, playing a conspicuous part in the royal cause in the civil wars, obtained in his own favor a reversal of his ancestor's attainder (see above), and in 1660 took his seat in the house of peers as second duke of Somerset, although the descendants of the first duke, by his first marriage, were then in existence. He died in 1675, and his ducal title passed to a cousin, on whose death it was inherited by Charles Seymour, known in history as the "proud duke of Somerset," a nobleman whose style of living was ostentatious and haughty in the extreme, and who filled several high posts in the courts of Charles II., William III., and Anne. He married the heiress of the Percies, by whom he had a son, Algernon, 7th duke, who was created earl of Northumberland, with remainder to his son-in-law, sir Hugh Smithson, the ancestor of the present Percy line. On the death of this duke a curious peerage case arose, the title being claimed by the descendants of the first duke by his first marriage, on the failure of the younger branch; and the attorney-general having reported in favor of the claim, sir Edward Seymour took his seat in the house of peers as 8th duke. From him the present holder of the title is third in direct descent.

SEYMOUR, GEORGE FOX, D.D., b. New York, 1829; graduated at Columbia college, 1850, and at the general theological seminary, Protestant Episcopal, 1854; was a missionary at Dobbs' Ferry for several years; principal of St. Stephen's college, Annandale, 1860; pastor of St. John's church, Brooklyn, 1863; elected professor of church history in the general theological seminary; chosen bishop of Illinois in 1874, but failed of confirmation by the general convention; was chosen dean of the seminary in 1875, and bishop of Springfield, Ill., in 1878.

SEYMOUR, HORATIO, LL.D., b. N. Y., 1810; received an academic education, studied law, but did not practice. He devoted himself after 1832 to the settlement of the paternal estate; and in 1841 went to the state assembly, to which he was re-elected three times, being speaker in 1845. In 1852 he was elected governor of the state and again in 1862, and was earnest in employing his power and influence for the prosecution of the war for the union, and especially in suppressing the draft riots in 1863. In 1868 he received the nomination of the democratic party for the presidency, with gen. Francis P. Blair, jr., as vice-president. The ticket was defeated by Grant and Colfax. Mr. Seymour has since remained in retirement on his farm at Deerfield, N. Y., near Utica, although his name was prominently considered for the democratic nomination for president in 1880. He has been president of the national dairymen's association, and of the prison association of the United States; has devoted much attention to agricultural questions, and frequently delivered addresses before agricultural bodies. His reputation is that of a profound statesman and astute politician.

SEYMOUR, THOMAS HART, 1803-68; b. Conn.; studied at the military academy, Middletown, Conn.; practiced law, and was made judge of probate. In 1837 he edited the *Jeffersonian*, a democratic newspaper; in 1843 was a member of congress; and on the breaking out of the Mexican war, volunteered and rose to be maj., and colonel. In 1850-53 he was governor of Connecticut; and 1853-57 minister to Russia. During the war of the rebellion he was with the south in sympathy, but took no active part.

SEYMOUR, TRUMAN, b. Vt., 1824; graduated at West Point, and served through the Florida and Mexican wars. He was under maj. Anderson at fort Sumter in 1861; afterward commanded a brigade under Meade, led a division at the assault on fort Wagner in 1863, commanded an expedition to Florida in 1864, and a division of the 6th corps in the Richmond campaign. He was brevetted maj. gen. in the U. S. army.

SEYNE, LA, a small but rapidly increasing seaport of France, on the shore of the Mediterranean, in the department of Var, 3 m. s.w. of Toulon. Fishing and navigation are the chief employments. Pop. '76, 8,152.

SE'ZZE, or SEZZA, a city of southern Italy, in the province of Rome, with 6,600 inhabitants. It is a very ancient city, and still preserves some remains of a triple wall of Cyclopean architecture, which surrounded the rock on which it stands.

SFORZA, a celebrated Italian family, which played a most important part in the affairs of Italy during the 15th and 16th centuries, swayed the destinies of northern Italy for many years, and allied itself with the first sovereign houses in Europe. Its founder was a peasant of Cotignola, in the Romagna, by name *Giacomo*, or *Muzio* (sometimes combined by historians into *Giacomuzzo Attendolo* (born 1369), who deserted his trade of wood-cutting to become a "condottiere," and by his intelligence and courage rose to a high position in the band to which he belonged. Count Alberigo de Barbiano, the founder of Italian "condottierism," bestowed upon him, on account of his prowess, the name of Sforza (Ital. "the forcer"); and such was his reputation among his comrades, that he speedily found himself the independent leader of a band of condottieri, and offered his services to the king of Naples. Queen Joanna II. made him constable of that kingdom, and in exercise of his office, he chased away the Aragonese, and

others, who attempted to deprive her of her dominions; but dying soon after (Jan. 4, 1424), he left his devoted followers to the chieftainship of his natural son, FRANCESCO SFORZA, then 23 years of age, who was as brave and enterprising as himself. Francesco, as was the custom of the time, sold his sword to the highest bidder, and without the slightest scruple fought for or against the pope, Milan, Venice, and Florence. He invented an improved system of tactics, and it soon came to be taken for granted that victory was certain for the party which he supported. It was thus no great act of condescension in the duke of Milan, the haughty Visconti, to confer upon him the hand of his daughter Bianca, with Cremona and Pontremoli as a dowry, and the promise of succeeding to the duchy itself. Meantime, Sforza took the march of Ancona from the pope (1434), added to it Pesaro (1443), and by a judicious combination of force and stratagem, obtained his elevation to the dukedom of Milan (Feb. 26, 1450), after the decease of his father-in-law. He solidly established his authority over all Lombardy, and several districts s. of the Po; acquired the esteem of Louis XI., who gave up to him Savona and Genoa; and after gaining the universal love of his subjects, died Mar. 8, 1466. Though uninstructed, he possessed considerable eloquence, and loved and protected letters. The successors to his power possessed few or none of his distinguished talents. His son, GALEAZZO MARIA SFORZA (1466-76) was a true tyrant, gloating over the torments of his victims, and a monster of debauchery, prodigality, and ferocity, without a single redeeming feature in his character. He was assassinated (Dec. 26) at the porch of the cathedral of Milan. His son GIOVANNI GALEAZZO SFORZA (1476-94) succeeded under the regency of his mother, Bona of Savoy, who held the reins of government with a firm hand. But she was forced to give up (1480) her able coadjutor, Simonetta, to the vengeance of her brother-in-law, Lodovico Maria, surnamed "the Moor," from his dark complexion; and three days after Simonetta's execution, the ambitious Lodovico banished herself, and assumed the regency. Finding the young duke in his way, Lodovico put him and his wife, Isabella of Calabria, in prison, and was immediately threatened with attack by the king of Naples, a danger which he attempted to ward off by giving his daughter, Bianca, with a dowry of 400,000 ducats, to the emperor Maximilian I., and by stirring up Charles VIII. of France to assert his claims to Naples. Soon afterward, duke Giovanni Galeazzo died, poisoned as some believe, by his uncle, Oct. 20, 1494. Lodovico MARIA (1494-1500) obtained his investiture as duke, and becoming alarmed at the rapid progress of the French in Italy, he joined the league against them, and was rewarded for his perfidy by being driven from his duchy, which was seized by the troops of Louis XII. (1499). The following year he made an ineffectual attempt to regain possession, was made prisoner, and carried to France, where he died in 1508. He possessed great talents, combined unfortunately with a low morality, which led him to value astuteness more than everything else; but his encouragement of letters and of the fine arts will preserve his name to posterity. His eldest son, MASSIMILIANO SFORZA (1512-15), regained the duchy of Milan after the reverses suffered by Louis XII., and with the aid of the Swiss steadily repulsed the various energetic attempts of the French to recover it; but after the battle of Marignan (1515), he abandoned his rights to the French for a pension of 30,000 ducats, glad to be free from the insolence and exactions of his allies, and the attacks of his enemies. His brother FRANCESCO MARIA SFORZA succeeded nominally to the Milanese after the battle of Pavia, but he was a mere puppet in the hands of Charles V., and on his death, Oct. 24, 1535, and the extinction of the main line of the house of Sforza, the duchy was quietly swallowed up by Austria. The lords of Pesaro (extinct in 1515), the counts of Santa-Fiore in Tuscany, still existing, and the dukes of Sforza-Cesarini, descend from collateral branches of the family.

SFORZA TO (Ital. forced), in music, often contracted *sf.* a term used to indicate that the note over or under which it is placed is to be played with strength and emphasis. A higher degree of emphasis is indicated by *sfz.* or *sforzato assai*.

'SGRAVESAN'DE, WILHEM JAKOB VAN, 1688-1742; b. Holland; educated at Leyden and Leipsic. In 1717 he was appointed professor of astronomy and mathematics, and in 1734 professor of philosophy, at the university of Leyden. His chief works are *Physices Elementa Mathematica* (1720); and *Philosophiæ Newtonianæ Institutiones* (1723).

SHACKLEFORD, a co. in n.w. central Texas; drained by branches of Brazos river; 870 sq.m.; pop. '80, 2,037—1932 of American birth; 256 colored. The surface is mostly prairie land and adapted for grazing. Cattle are exported. Co. seat, Albany.

SHAD, *Alaxia* or *Alosa*, a genus of fishes of the family *Clupeidae*, differing from *clupea* (the herring, etc.) in having the upper jaw deeply notched. The teeth are very small, on the jaws only, and often wanting, at least in the adult fish. The species are numerous, inhabiting the sea, but some of them ascending rivers like the salmon, and spawning there. They are very like herrings in form and appearance, and on this account, and their large size, the British species receive from Scottish fishermen the name of *king of the herrings*. The herrings of extraordinary size, of which the capture is sometimes reported, are probably always shad.—The COMMON SHAD, or ALLICE SHAD (*A. communitis*), is rather thicker and deeper in proportion to its length than the herring. It is found on the British coasts, and in the lower part of some of the large rivers, more abundantly in the Severn than in any other British river. It attains a length of two or even three feet, and a weight of from four to eight pounds. It has no teeth. There is

a single black spot behind the gills. Its flesh is of good flavor. The TWAITE SHAD (*A. finta*) is more plentiful on the British coasts, and is the common shad of the Thames, but the foul state of the river has now made it of very rare occurrence above London. It is smaller than the Alice shad, seldom exceeding 16 in. in length; there are small teeth in both jaws, and a row of dusky spots along each side of the body. The flesh is coarser, and less esteemed than that of the Alice shad, but much used for food wherever the fish is plentiful. This species spawns later in the year than the last, and in order to permit it to deposit its spawn, its capture in the Thames is prohibited after the end of June. It abounds in many of the rivers of France, and other parts of Europe.—A species of shad, generally weighing about four or five pounds, but sometimes twelve pounds, is very abundant during some months of the year in some of the North American rivers, as the Hudson, Delaware, Chesapeake, and St. Lawrence, and forms an important source of wealth. It is highly esteemed for food. Great quantities are salted.

SHAD (*ante*). The most esteemed species of shad are the *alosa vulgaris* and *alosa finta* of western Europe, the *alosa sapidissima* of the eastern United States, and the *alosa rochei* of the Yang-tse-Kiang in China. The American and Chinese species are held in the highest regard, the shad of the Connecticut river being the finest in America. They attain to the best condition, and sometimes weigh five or six pounds, the average being about four. The North river shad is somewhat smaller, and those of the Delaware, and rivers further south being rather smaller still. While in the sea shad are said to live chiefly on small crustaceans, but when ascending rivers they eat but little. For several years until recently the supply of shad decreased in most of our rivers, especially the Hudson; but they are said to have become more plentiful, owing to the efforts of the fish commissioners. They have been introduced into the Pacific rivers, and increased in the Mexican gulf waters. It has been attempted to introduce American shad into Germany, but not successfully, on account, it is said, of the shortness of the hatching period there.

SHADETREE. *Citrus decurmanis* (see CITRUS), a tree, which, like the other species of the same genus, is a native of the East Indies, and which has been long cultivated in the E. of Europe. It is said to derive its English name from a capt. Shaddock, by whom it was introduced into the West Indies. It is readily distinguished from most of its congeners by its large leaves and broad-winged leaf-stalk; it has very large white flowers, and the fruit is also very large, sometimes weighing 10, or even 14 pounds, roundish, pale yellow; the rind thick, white and spongy within, bitter; the pulp greenish and watery, subacid, and sub-aromatic. It is a pleasant, cooling fruit, and much used for preserves. The tree is rather more tender than the orange, but with proper care is often made to produce fine fruit in orangeries in Britain.

SHADOW is a portion of space from which light is debarred by the interposition of an opaque body. If the luminous body be too near, or too large to be considered as a mere point, then each atom of the light-giving surface throws its own shadow independent of the others. We have thus in reality a multiplicity of shadows overlapping each other, and forming what in common parlance is "a" shadow of the opaque body, which is darkest at those places where all the separate shadows overlap each other, and becomes lighter as it gradually falls beyond the limits of more and more of these separate shadows. See PENUMBRA. The depth of a shadow depends from mere force of contrast on the intensity of the light around it; it also depends much on the nearness of the object, as compared with its size, to the surface upon which the shadow is thrown; for the rays of light, by their properties of reflection, refraction, and dispersion, tend to bend "round" the opaque object, and the increase of distance between an object and its shadow allows more scope for this action.

SHAD TREE, or SHAD BUSH. See JUNE-BERRY.

SHADWELL, THOMAS, a dramatic writer of some note in his day, though now only remembered as the "Mac-Flecknoe" of Dryden's satire, was b. in 1640 in Norfolk. He was educated for the law, but not finding it a pursuit to his mind, he deserted it, and, after an interval of foreign travel, betook himself seriously to literature. His first comedy of *The Sullen Lovers* (1668) had great success, and he continued from year to year to entertain the town with a succession of similar pieces, a complete edition of which was published after his death in 4 vols 12mo. The immortality which these must have failed to achieve for him, he was fated to attain in a way somewhat less desirable. With Dryden he seems, in the earlier portion of his career, to have been on terms of friendly intimacy; but literary jealousies divided them, and the quondam friend became a favorite butt for the shafts of Dryden's deathless ridicule. Though his works—hasty and careless as they are—exhibit lively talent and considerable comic force, all that the literary world now knows of Shadwell is that "Shadwell never deviates into sense." It might a little console him, under the satire of his enemy, that he succeeded him in the post of poet-laureate, which in 1688 it became necessary for Dryden to resign. He did not long survive to enjoy it, however, as in 1692 he died, it is said of an overdose of laudanum, a drug in which he was wont to indulge himself.

SHAF'ITES, the name of one of the four principal sects of the Sunnites (q.v.), or "orthodox" Moslems. Its name it received from its founder, Abu Abdallah Moham.

med Ibn Idris, called Al-Shafei, from one of his ancestors who descended from Moham-med's grandfather.

SHAFT, the body of a column, extending between the base and capital. In Gothic architecture the term is applied to the small columns clustered round piers, or in the jambs of doors and windows. In the early styles the shafts are frequently of finer material than the pier, such as Purbeck marble, and polished and banded. In later examples the shaft is generally attached, and of the same piece as the pier. For illustration see COLUMN.

SHAFTESBURY, commonly called **SHASTON**, a very ancient town of England, a municipal and parliamentary borough in Dorsetshire, 27 m. n.n.e. of Dorchester. It stands on the narrow ridge of a chalk hill, and commands extensive and beautiful views of the counties of Dorset, Somerset, and Wilts. The date of its foundation is unknown, but it seems to have been a Roman station. In the reign of Athelstan (924-940) it contained two mints and an abbey of Benedictine nuns. Here Canute the great died in 1036. Pop. 71, of municipal borough, 2,472.

SHAFTESBURY, **ANTHONY ASHLEY COOPER**, Earl of, English statesman and philanthropist, is descended from a family intimately associated with the political history and literature of England. Sir John Cooper of Rockbourne, Hampshire, married Anne, daughter and sole heiress of sir Anthony Ashley of Wimborne, St. Giles, Dorsetshire, secretary-at-war in the reign of queen Elizabeth. Their eldest son, sir Anthony Ashley Cooper (born 1621), was actively engaged in public affairs during the civil wars. He first espoused the cause of royalty; he then became one of the most eminent of the parliamentary leaders in the council, and not the least active in the field. When he saw that the restoration was inevitable, he took so prominent a part in bringing back Charles II. that he was raised to the peerage as baron Ashley. He was a member of the justly infamous "Cabal" ministry, and was afterward appointed to be lord chancellor, with the earldom of Shaftesbury. He was the "Achitophel" of Dryden, by whom his character is drawn with as much truth as power. He hated a calm, lived all his life in intrigues, and in his 62d year his "fiery soul" wore out his small and fragile body. He will be honored for all time by men of English race and descent as the author of the habeas corpus act. He also first introduced a bill rendering the judges independent of the crown.—His grandson, **ANTHONY COOPER**, third earl (born 1671, died 1713), author of the *Characteristics*, the friend of Pope, and the other celebrities of the Augustan age, obtained from Voltaire the questionable praise of being the boldest of the English philosophers.—The sixth earl was for many years chairman of committees of the house of lords.

His son, **ANTHONY ASHLEY COOPER**, seventh earl of Shaftesbury, was b. in Grosvenor square, London, April 28, 1801. He was sent to Harrow, and thence to Christ Church, Oxford, where he obtained a first-class degree in classics in 1822. He represented the borough of Woodstock from 1826 to 1830; the county of Dorset (in which the family estates are situated) from 1831 to 1846; and the city of Bath from 1847 to 1851, when he succeeded to the earldom. During his long career in the lower house he held one or two subordinate posts. He is better known by his attempts to improve the social condition of the laboring classes. As he belonged to the conservative party, and represented an agricultural county, the manufacturers, and their organs in the press, received his allegations respecting the condition of their operatives in a hostile and antagonistic spirit, and retorted that the wages of families engaged in factories amounted to twice and three times the sum paid to the Dorsetshire laborers. Yet lord Ashley returned again and again to the charge; and on the death of Mr. Sadler, m.p., took charge of the ten hours' bill. The manufacturers declared with alarm that any reduction in the hours of labor would be fatal to our manufacturing supremacy. Successive governments naturally believed these prophecies, and almost all the leading statesmen of the day opposed the ten hours' bill. But public opinion declared in favor of a limitation of the hours of labor. Lord Ashley carried his bill through parliament, and has the satisfaction of knowing that the opponents of the measure admit, without an exception, that it was an act of wise and beneficent legislation, and that their alarms were groundless. When he visited the manufacturing districts, he was honored with an enthusiastic ovation. He refused to join sir R. Peel's administration in 1841 because that statesman refused to countenance the ten hours' bill. In 1846 he supported sir R. Peel in his proposal to repeal the corn laws, an act which cost him his seat for Dorsetshire. When he successfully contested Bath against Mr. Roebuck in 1847 he appeared on the field of politics as a "liberal conservative." After his accession to the earldom, Shaftesbury took a more prominent part in connection with various religious, social, and philanthropic societies. These are so numerous that a list of the associations with which he is in some way officially concerned, would include almost every scheme having for its object the physical, moral, and spiritual improvement of society. He belongs to the evangelical party in the church of England, and is a prominent member of the chief church societies. He is married to a daughter of the fifth earl Cowper, and being thus a connection by marriage of the late viscount Palmerston (whose government he steadily supported), many of the ecclesiastical appointments and promotions of evangelical clergymen made by that minister were attributed to his influence. He has followed up

the ten hours' bill by obtaining the assent of parliament to other measures regulating defective workshops and factories, night-work, and the treatment of children by their employers. Among honors that have been conferred on Shaftesbury are the Oxford degree of D.C.L. in 1841, and the honorary citizenship of Edinburgh in 1878.

SHAG. See CORMORANT.

SHAGREEN is generally understood to mean shark skin dressed and rubbed down smooth or not; but the oriental shagreen, formerly in so much repute, consists of portions of the skins of horses, asses, camels, and oxen, the part used being strips taken from head to tail, along the center of the back. These strips are prepared by soaking in water, and currying; and when in the proper condition, they are laid on the ground, and the seeds of *cheuopodium album* are sprinkled over them; a board or piece of felt is then placed on the seeds, and by pressure the hard seeds are forced deeply into the skin, which is then hung to dry. When dry, the seeds are removed by shaking, and the skin pared down with a proper knife nearly, but not quite as low, as the bottom of the depressions caused by the seeds. After this the skin is again soaked, and the parts compressed by the seeds now rise up and form elevations, which are increased by washing in a solution of salt. The last operation is dyeing them of various colors, green being the favorite one. Owing to the difference of texture produced by the operations of compressing by the seeds, paring, etc., the color is taken irregularly; and when dyed green, the material somewhat resembles malachite in appearance when dried and polished. It was at one time a very favorite material in Britain for covering small cases and caskets of various kinds, especially spectacle-cases.

SHAH (Persian, *prince, king*), the general title of the supreme ruler in Persia, Afghanistan, and other countries of southern and central Asia. The sovereign, however, may, and frequently does, decline the title, assuming in its place that of *khan* (q.v.), an inferior and more common appellation. The same title can also be assumed by any of the shah's sons, and upon all the princes of the blood the cognomen *shah-zadeh* is bestowed.

SHAH-JEHAN, or "king of the world," the title assumed on his accession to the throne by Khurram Shah, the third son of Selim Jehan-Ghir, and the fifth of the Mogul emperors of Delhi. He was during his father's reign employed in military expeditions against the Rajputs, the independent Mohammedan states of the Deccan, and the Afghan tribes around Candahar, in which he greatly distinguished himself by bravery and military skill; but on his return he was forced into rebellion (1623) by the intrigues of his enemies at court, and was still unreconciled to his father at the latter's death in 1627, when he was at once saluted as emperor by the nobles. At his accession the empire had reached the summit of its greatness, but the causes which lead to its rapid decline at the same time unmistakably showed themselves; the territory was too extensive for the system of government which was generally pursued by the Moguls; the discordant parts were unconnected by any bond of union; the supreme ruler was looked upon in many provinces as a mere tax-collector; and with the thus necessary absence of any spirit of loyalty, insurrections were frequent in all the provinces. The chief events of Shah-Jehan's reign were the war against the Deccan sovereignties, which resulted in the complete destruction of the kingdom of Ahmednuggur (1631), and the subjugation (1636) of those of Beejapur and Golconda; an indecisive contest against the Uzbeks of Balkh (1644-47); two unsuccessful attempts to recover Candahar from the Persians; and a second successful war, conducted by his third son, Aurungzebe, against the Deccan princes (1655). But in 1657 the emperor fell dangerously ill, and his four sons, who were ambitious of attaining supreme power, immediately commenced to dispute regarding the succession. See AURUNGZEBE. Ultimately Shah-Jehan was taken prisoner, and confined in the citadel of Agra till his death, Dec., 1666. Shah-Jehan united the voluptuous profligacy so common in eastern monarchs with great sagacity, and the strict administration of justice to Moslem and Hindu alike. In his later years he became avaricious, increased the taxes, and confiscated the property of his wealthier subjects on the slightest pretexts. The magnificence of his court was unequalled; the splendid "peacock throne" was constructed by his orders at a cost of about £7,000,000, and many magnificent public buildings executed under his direction remain as monuments of his greatness. Chief of these are the city of Shah-Jehanabad, and the superb mausoleum of Tajmahal (see AGRA). Yet so strict was his financial management that he left a well appointed army of 200,000, and a treasury containing £24,000,000, to his son Aurungzebe.

SHAHJEHANPORE, a t. of British India, the principal place of a district of the same name, n.w. provinces. It stands on the Gurrah, a feeder of the Ramgunga, 94 m. n.w. from Lucknow. Pop. '72, 72,140.

SHAH NAMEH, Book of Kings, the title of several eastern works, the most celebrated of which is the Persian poem of this name, by Firdusi (q.v.), containing the history of the ancient Persian kings in about 60,000 distichs, and written by the order of sultan Mahmud of Ghizni, in the space of thirty years. Another work, in Turkish, under the same name, comprises the history of all the ancient kings of the east, and was written by Firdusi Al-Thauil. Bajazet II., to whom the book was dedicated, ordered the author

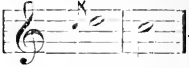

to reduce it from its original bulk of 300 vols. to 80. Firdusi, however, felt so mortified at this proposal that he preferred leaving the country altogether, and emigrated to Khorassan, in Persia.

SHAIRP, JOHN CAMPBELL, LL.D.: b. Scotland, 1830; educated at Glasgow university and Balliol college, Oxford; was assistant master of Rugby school; professor at St. Andrews in 1861, and principal in 1868. He has published *Kilmahoe, a Highland Pastor; Studies in Poetry and Philosophy; Lectures on Culture and Religion*; and contributed largely to periodicals.

SHAKE, in music, an embellishment produced by the continued and rapid repetition of one note alternately with another either a whole tone or semitone above it. Its sign is *tr* (the first two letters of the Italian *trillo*), placed over or under the principal note.

For example:  is played thus: ; the

exact number of repetitions being indefinite. A shake is often preceded by an appogia-

tura (q.v.), and is very generally finished with a turn, as  played:

 We may have shakes on two notes at

once; and a series of shakes on several notes is called a chain of shakes.

SHAKERS, the name commonly given to a small religious sect existing in the United States. The proper or official description of this sect is the united society of believers in Christ's second appearing; but its members seem to have accepted the designation of Shakers, though it was originally applied to them in ridicule, on account of certain rhythmical movements of the hands and arms which form part of the ceremonial of their worship. Though the Shaker societies are found only in the United States, their creed had an English origin. The founder of the sect, in whose person they believe that Christ has appeared a second time, was an Englishwoman, named Ann Lee, a native of Manchester, who emigrated to New York with a small band of disciples, shortly before the outbreak of the revolutionary war.

Ann Lee was the daughter of a blacksmith, who lived in Toad lane in Manchester; a very poor man, who gave her no education, and sent her while a mere child to work in a cotton-mill. She seems to have been a violent, hysterical girl, ambitious of notice, and fond of power, and to have always possessed, in virtue of her strong will and vehement temper, a great deal of influence over the people around her. She married while very young a blacksmith named Stanley. She had four children, all of whom died in infancy—to this, perhaps, may be ascribed the preference of the celibate to the married life, which she ultimately raised into a part of her religious system. She became one of the earliest believers in a propheticess, who appeared about 100 years ago, in the town of Bolton-on-the-Moors, in Lancashire—a poor woman, named Jane Wardlaw, the wife of a tailor, who believed she had "received a call" to go forth and testify for the truth. The burden of Jane Wardlaw's message was, that the end of all things was at hand, that Christ was coming to reign upon the earth, and that his second appearance would be in the form of a woman, as prefigured in the Psalms. In subordination to this, she took up several of the tenets of the society of Friends, to which she and her husband originally belonged; especially, she raised her voice against war and against profane swearing. Her followers believed that she was filled with the Holy Spirit; they received her utterances as the voice of God; and she acted as if all the powers of earth and heaven had been given into her hands. Ann Lee on her conversion, began to preach the same message in Toad lane and the adjacent streets of Manchester; but she soon went beyond her teacher, and gained the leadership of her co-believers for herself. It happened that she was brought before a magistrate, charged with an obstruction of the streets, caused by the crowd collected to hear her preach, and she was sent to the Old Bailey prison in Manchester. When she came out of prison, she gave forth, that one night, a light had shone upon her in her cell; that the Lord Jesus stood before her; and that he became one with her in form and spirit. Her pretension was, that Christ was come to reign in her person. It was favorably entertained by the followers of Jane Wardlaw; and they acknowledged her as their head or mother, in place of Jane, whose pretensions had never gone so far. She found, however, that among her neighbors and fellow-workers, her claim to be the bride of the Lamb, the queen described by David in the Psalms, excited only jeering and ridicule, and she received a revelation that she should seek in America a home for herself and her few disciples—that it was in America that the foundations of Christ's kingdom were to be laid. So she went to New York, accompanied by seven disciples—five males and two females. Her husband also went with her; but he seems to have had no faith in her, and he left her soon after their arrival, in consequence of one of the features then introduced into her system. This was the practice of celibacy, which she had not previously enforced upon her followers, though she had enjoined it as a duty. Her teaching was, that men

called into grace must live as the angels do, among whom there is no marrying or giving in marriage, that no form of earthly love could be allowed in the Redeemer's kingdom. Finding a populous city unfavorable to her designs, she removed, with her followers, first to Albany, then far into the wilderness to Niskenna, and there founded the settlement which still exists, of Water Vliet. It was in the spring of 1780—when she had been three years and a half at Niskenna, looking for new believers to come in, but making no attempt to win them—that the first American converts joined her society. A revival had taken place at Albany, and had spread through the surrounding districts; and from Hancock and New Lebanon a deputation was sent to Niskenna, to see what light its inhabitants enjoyed as to the way of salvation. The deputation consisted of Joseph Meacham and Lucy Wright—subsequently the heads of the Shaker society. These persons became believers in Ann Lee; and through their agency other converts were won, and a Shaker society established at New Lebanon. Toward the close of 1780, the revolutionary war being then in progress, notoriety was given to Ann Lee's pretensions, through an incident seemingly unfavorable. Owing to her British origin, her denunciations against war, and her refusal to take the colonial oaths, Ann was imprisoned for some time at Poughkeepsie, on suspicion of being a British spy. Before she was let out of prison, in December, 1780, all the colonies had heard of "the female Christ." In the following year, she started upon a missionary tour through New England and adjacent colonies; she found the people everywhere curious to see her, and she made not a few converts. She did not return to Water Vliet till Sept., 1783; and about a year after, she died. Her death was a surprise to many of her followers, who believed that she was to live among them forever; but her successors—the Joseph Meacham and Lucy Wright already mentioned—to whom, on her death-bed, she had made over the headship of the society, were ready with a theory accounting for it. "Mother Ann," they said, could not die, and was not dead, and had not ceased to live among her people. She had only withdrawn from the common sight; she was still visible to eyes exalted by the gift of grace; she had cast the dress of flesh, and was now clothed with a glory which concealed her from the world. So it would be with every one of the saints in turn; but the spirit of those who "passed out of sight" would remain near and be in union with the visible body of believers. This explanation was generally accepted, and has become a vital part of the Shaker creed.

By Joseph Meacham and Lucy Wright, the successors of "Mother Ann," the Shakers were gathered into settlements, ten in number; and a covenant was drawn up embracing the chief points of their creed, and of the social system since associated with it. Their head was, of course, "Mother Ann"—that is, Christ—of whom Joseph and Lucy were temporarily the representatives; elders and deacons, male and female, were appointed; the institution of celibacy was confirmed; and a community of goods was introduced. On the death of Joseph Meacham in 1793, "Mother Lucy" became the sole head of the society, and she governed it with ample powers for 25 years. She named a female successor with the title of elderess; and the name of "mother" has not, since that time, been applied to the female head of the community. Eleven societies were formed between 1787 and 1792. Early in the present century a remarkable religious excitement took place in Kentucky. The Shakers, taking advantage of this movement, sent three representatives thither, and received sufficient additions to found five new societies. (See Nordoff's *Communist Societies of the United States*, 1875.) The Shakers were, at the census of 1870, about 2,500 in number, included in 18 societies; of which three are in the state of New York, four in Massachusetts, two in New Hampshire, two in Maine, one in Connecticut, four in Ohio, and two in Kentucky. Their numbers have increased since 1870; the influence of their opinions has extended; and the 18 separate settlements continue to form a united and peaceful society.

Their doctrine has been to some extent developed as well as systematized since the death of "Mother Ann." They believe that the kingdom of heaven has come; that Christ has come upon earth a second time, in the form of "Mother Ann," and that the personal rule of God has been restored. Then they hold that the old law has been abolished, and a new dispensation begun; that Adam's sin has been atoned; that man has been made free of all errors except his own; that the curse has been taken away from labor; that the earth and all that is on it will be redeemed. Believers, on going "into union," die to the world, and enter upon a new life, which is not a mere change of life, but a new order of being. For them, there is neither death nor marriage; what seems death is only a change of form, a transfiguration which does not hide them from the purified eyes of the saints; and in union, as in heaven, there is no marrying or giving in marriage—the believer owes love to all the saints, but his love must be celibate in spirit and in fact. The believer, living in union, is in heaven. The Shakers believe that the earth, now freed from the curse of Adam, is heaven; they look for no resurrection besides that involved in living with them in "resurrection order." The believer, upon entering into union, leaves behind all his earthly relationships and interests, just as if he had been severed from them by death. And since to be in union is heaven, the Shakers hold that no attempts should be made by them to draw men into union; God, they say, will draw to them those whom he has chosen at his own time. Those who have "passed out of sight" are still in union; and the Shakers live in daily communion with the spirits of the departed believers. The belief in a communion with angels and

spirits is no mere theory; it has a most important influence upon their lives; they profess to be more familiar with the dead than with the living. It being the work of the saints to redeem the earth from the effects of the curse, labor is a sacred and priestly function, especially when bestowed in making the earth yield her increase, and in developing her beauty. It should be done in a spirit of love; the earth, they say, yields most to those who love it; and love and labor will in time restore it to its primitive state. According to Mr. Dixon, they bestow upon their gardens and fields the affections which other men bestow upon family or worldly goods. Their country they regard only as it is a part of the earth, which they love, and as the favored land in which God's kingdom is first to be established. In its politics and its fortunes, they take no interest; and, indeed, their whole system is a protest against the existing constitution of society, as well as against the ordinary lives of men. Consistently with their belief in the second appearance of Christ in the form of a woman, the Shakers seem to believe that there is a female as well as a male essence in the Godhead—in the motherhood as well as the fatherhood of God.

A Shaker settlement is, for convenience, divided into families, consisting of the brothers and sisters, who live in the same houses, each governed by an elder and an elderess. There are two orders of members, probationers and covenanters—that is, novices and full members. It is on becoming a covenanter that the Shaker puts his property into the common stock. On entering upon residence, he becomes subject to all the rules of the society; but he is free—whether a covenanter or a probationer—to leave the body whenever he pleases. Both men and women wear a prescribed dress. The men wear a sort of Arab sack, with a linen collar and no tie; an under-vest buttoned to the throat, and falling below the thighs; loose trousers, rather short; and a broad-brimmed hat, usually of straw. The women wear a small muslin cap, a white kerchief round the chest and shoulders, a skirt dropping in a straight line from the waist to the ankle, white socks, and shoes. Some latitude is allowed as to the materials of the dress. Men and women, it is said, have the look of persons at peace with earth and heaven. "Apart from a costume," says Mr. Hepworth Dixon, "neither rich in color nor comely in make, the sisters have an air of sweetness and repose, which falls upon the spirit like music shaken out from our village bells." [*New America*, by W. Hepworth Dixon (Lond. 1867), from which the materials of this sketch have in a great measure been derived.] All labor with their hands, both men and women; but the latter do only indoor work. Every man, whatever his rank in the church, follows some manual occupation, and most of them have more than one. Working not for gain, but with loving care, and with the sense that they are exercising a priestly function, the Shakers are unrivaled among their neighbors in the arts to which they apply themselves, especially the culture of their land, and the production of fruits and flowers. They pay great attention to ventilation and to all sanitary conditions; they live almost entirely upon the produce of the soil, and drink only water; they employ no doctors and take no drugs, and are, nevertheless, among the healthiest of communities. Their society is recruited mostly by young men and girls; but, occasionally, married persons with their children come "into union," and make, it is said, "very pretty Shakers." Husbands and wives, when they have come "into union," become as brothers and sisters; it would be thought a weakness, says Mr. Dixon, and almost a sin, for them to feel any personal happiness in each other's company—they live for God alone, and their love ought to be shed on all the saints alike. The education of the children attached to the society is the work of the sisters, and they do it exceedingly well. The brothers and sisters take their meals in a common room, eating at six in the morning, at noon, and at six in the afternoon. Their meals are taken in silence, any direction that has to be given being given by a gesture or in a whisper. In their church-service, music bears a prominent part: the hymns and chants which are used being all of Shaker origin, communicated to believers in dreams and reveries by the spirits with whom they have communion. A deputation of Shakers visited England in 1871, and made many converts.

SHAKESPEARE, WILLIAM, the chief literary glory of England, was b. at Stratford-on-Avon, in Warwickshire, it is believed, April 23, 1564. Certain it is, as vouched by the parish register, that his baptism took place three days after, on the 26th. His father, John Shakespeare, seems to have belonged by birth to the class of yeomen. His mother, Mary Arden, was of more distinguished origin. She came of a good old Warwickshire family; and when married, she brought to her husband as dower a property called Ashbies, 54 acres in extent, besides an interest in certain other lands at Wilmecote, and a small sum of money. In a contemporary document, John Shakespeare is described as a *glover*; and this trade, at that time a more important one than it has since become, there is evidence to show that he conjoined with that of a farmer and rearer of stock. His earlier career was one of steady prosperity, and the consideration in which he came to be held as a citizen is shown in the fact of his having in 1569 been elected chief magistrate of Stratford. Of a family of four sons and four daughters born to him, William was the third child. At the free grammar-school of Stratford there can be no doubt the young Shakespeare received his entire education. As to the precise character and amount of this, there has been much controversial conjecture; some writers maintaining, on the internal evidence of his works, that he must have enjoyed a thorough classical

training, while others represent him as probably destitute of any such youthful advantage. The celebrated "And though thou hadst small Latin and less Greek" of his friend Ben Jonson, which has been frequently quoted as certifying his almost utter ignorance, seems, if anything, to tell the other way. It assures us that, of both languages, he knew something; as to *how much* of either he may have known, it affords us scarce a ray of light, inasmuch as it is impossible for us even to guess at the amount of classical attainment sufficient, in the eyes of a scholar, and something of a pedant, like Jonson, to entitle a man to the praise of having *much* Latin and Greek. What Ben might contemptuously style "small Latin" was, in all probability, as it seems to us, a fair working allowance of it.

Meantime, misfortune had overtaken, and more and more come to press heavily on John Shakespeare; in consequence of which, William, now somewhat over 14, was withdrawn from school, and set to do something for his living. How he was employed from this time till his departure for London, it is impossible to make out with distinctness. One tradition informs us that, for a time, he served as apprentice to a butcher; and it is said that "when he killed a calf," the poetry of his nature prompted him to ennoble the operation as he could to himself, by "doing it in a high style, and making a speech." Unhappily, none of his speeches have come down to us, so that rather more of a mythical atmosphere than might be wished surrounds this pursuit of the ideal under difficulties. But that he was for some time a butcher's assistant, is as likely to be true as not. Another story has it, that for some years he was a school-master; whether or not in birching his boys he dignified the act as in the calf's case, tradition has omitted to inform us. Both stories are not unlikely to be true; the fact of the matter probably was, that in those years young Shakespeare lived miscellaneously as he could. Out of the cloud of uncertainty which shrouds this period of his life, two facts, however, emerge as beyond question—his marriage, and the birth of his eldest born. As soon as may be after Nov. 28, 1582—on which day the license was procured at Worcester—Shakespeare, a tively lad going 19, was married to Anne Hathaway of Shottery, a hamlet some mile or so out of Stratford, a damsel about eight years older than himself; and six months afterward a daughter was born to him, whose baptism bears record May 26, 1583. The obvious inference from this promptitude on the part of his spouse certain of his admirers have sought to evade. It is said, and we believe it is certain, that a mere betrothal before witnesses, to be followed within some reasonable undefined period by the religious ceremony, was then and there held to constitute a valid marriage; and this, it is conjectured, may in Shakespeare's case have preface the more formal sanction. And of course it may; the license of conjecture is unlimited; and all to whose comfort in admiring a great genius it is essential to regard him at every point of his career as also a pattern of everything that is proper, must of course be made welcome to this one. The only other children born of the marriage were twins, a boy and a girl, baptized Feb. 2, 1585. The boy (Hamnet) did not survive his father, dying in his 12th year.

As nearly as can be made out, in the year 1586, Shakespeare, then 22, left the neighborhood of Stratford, and betook himself to London. A local tradition assigns as his reason for doing so a mishap which befell him, and a little imprudence consequent on it. The future poet, it is said, while out on a nocturnal poaching expedition in the deer-park of a neighboring magnate, sir Thomas Lucy of Charlecote, was caught by the keepers, kept for the night a prisoner, and arraigned before sir Thomas—a justice of peace—in the morning. What passed is not recorded; but—as the old rumor goes—whatever it was, it excited the ire of Shakespeare, who avenged himself, as a hard naturally might, by circulating "a bitter ballad" in which the good knight was satirized. A further prosecution was for this irreverence directed against him, to escape which it was that he is said to have fled to London. No anecdote concerning Shakespeare has been more widely accepted than this, or, on the whole, seems better to deserve acceptance. An obvious allusion to the Lucies of Charlecote in the *Merry Wives of Windsor*, which identifies their coat of arms with that of justice Shallow, would of itself afford strong confirmation of it. Further, Oldys, an antiquary who died in 1761, and had busied himself much about materials for a life of Shakespeare, certifies the story on something like fair evidence, and gives the first verse of the obnoxious pasquinade, as remembered in the district. It is more coarse and scurrilous than witty; but inasmuch as it would be easy to adduce passages from the admitted writings of Shakespeare in which the coarseness to at least an equal extent preponderates over the wit, this will scarcely of itself amount to proof that he could not possibly have been its perpetrator. The indisposition which more lately has been shown to attach any credit to the tale, seems to rest entirely on a foolish horror of admitting anything as possible in the conduct of the poet which might any way seem to conflict with the reverence now universally accorded to his genius.

No certain details have come down to us as to Shakespeare's earlier relations with the London theater. According to one tradition, he was content at first to turn a penny by holding horses at the door. According to another—which seems in a natural sequence with the foregoing—we find him admitted inside on his promotion, though as yet only in the humble capacity of prompter's attendant. What is certain in the matter is this, that if at any time he was thus meanly occupied, it could have been only for a brief period, as very speedily we have note of him as a man of some importance, at once

dramatist, actor, and shareholder in the Blackfriars theater. As an actor—though we find one contemporary allusion to him as “excellent in the quality he professes”—he seems at no time to have shone especially, being rather respectable than eminent. As dramatist, his magnificent powers were at once recognized, and in no long time had won for him the very foremost rank among the writers for the stage of his time. The extraordinary rapidity of his rise is shown in this indubitable reference to him in Spenser’s *Teares of the Muses*, published as early as 1591, only some five years after Shakespeare’s arrival in London:

And he, the man whom Nature’s self had made
To mock herself, and truth to imitate,
With kindly counter under mimic shade,
Our pleasant Willy, ah, is dead of late.

The reference here has indeed been surmised to point at sir Philip Sidney, by Spenser elsewhere alluded to under the figure of Willy a shepherd; but the surmise is, on various grounds inadmissible. The first two lines have the closest critical pertinence to the character of Shakespeare’s genius; as applied to that of Sidney, they are, by comparison, vague and unmeaning. Further, the “mimic shade” in the third line, together with the whole context of the passage, makes it certain a dramatic writer is alluded to; and this Sidney was not. Moreover, the stanza which follows, wherein of “that same gentle spirit” it is said that he

Doth rather choose to sit in idle cell,
Than so himself to mockery to sell,

must needs be held to indicate a man at the time living; and Sidney had died in 1586. The “Ah, is dead of late!” which, literally taken, would suit Sidney, and not Shakespeare, must, in the light of the succeeding couplet, be interpreted as referring to some temporary remission on the part of the latter of his wonted dramatic productiveness; and this, if not otherwise to be accounted for, we might explain by supposing him at this time engaged on his two elaborate poems, *Venus and Adonis*, and *The Rape of Lucrece*, published not long afterward. The year after (1592), we find a contemporary and brother dramatist, Henry Chettle, making the *amende* to Shakespeare for an offense given, in terms most respectfully appreciatory of his excellences at once as a man and an author; and in 1598, Francis Meres, in his *Wit’s Treasury*, writes of him as admittedly the “most excellent among the English for both kinds of tragedy and comedy.” We have ample evidence besides of the unrivaled acceptance his works obtained from all classes; not only were they in the wider sense popular, but they brought him special marks of favor and approval from queen Elizabeth and her successor, James—who is said to have honored the poet with an “amicable letter” from his own hand—and procured him the patronage and friendship of some of the most accomplished men of rank of the time, more notably, Henry Wriothesley, earl of Southampton, to whom he dedicated his *Venus and Adonis*, and *Rape of Lucrece*; and William Herbert, earl of Pembroke, commonly held to be the “Mr. W. H.” to whom, as their “only begetter,” his *Sonnets* are addressed.

Shakespeare was plainly—as men of consummate genius mostly are—a man of shrewd solid business ability; and throughout, his material prosperity kept pace with the growth of his poetical reputation. He became early, as we saw, a considerable shareholder in the Blackfriars theater. In the Globe, subsequently erected, he was also a part proprietor. To both he contributed dramas, and from his gains in the triple capacity of actor, author, and sharer of the general profits, he rapidly amassed a fortune. His local attachments were strong, and it seems to have become, as his wealth increased, one main object of his ambition to settle himself as a substantial country gentleman in his native district, to which annually he made a visit. We find him, with this view, from time to time making purchases there of house and landed property. By and by, his visits to Stratford became more and more frequent; and it is positively certain that previous to the year 1613, he had ceased to reside in London, and finally established himself at Stratford. Of his last years there spent, further than that they lapsed peacefully in honor, and the exercise of a liberal and kindly hospitality, nearly nothing is known. There is evidence of his having more or less occupied himself in agricultural pursuits, and good reason to believe that, though withdrawn from other active concernment with the stage, he still continued to write for it. His death took place on his 53d birthday, the 23d of April, 1616. In the diary of a Mr. Ward, the vicar of Stratford, writing *apud* 1630, the cause of it is thus given: “Shakespeare, Drayton, and Ben Jonson had a merry meeting, and, it seems, drank too hard, for Shakespeare died of a fever then contricted;” but that of this drinking the poet’s death was a consequence is at best a doubtful inference.

That Shakespeare erred and sinned at times like others, we know from the passionate confessions of his *Sonnets*, in considerable portions of which the self-reference is too plain be denied; but that, whatever his occasional frailties, he was essentially a man of noble and estimable character, there is a complete concurrence of testimony. He was obviously of most kindly and lovable dispositions; his “pleasurable wit and good nature” made him delightful as a companion; and it was as “gentle Will Shakespeare” that he was familiarly known to his contemporaries. In particular, with his associates and rivals in writing for the stage, his relations would seem to have been of the most cordial and

even endearing kind. The gruff Ben Jonson writes of him after his death: "he was honest, and of an open and free nature," assures us that in "his well-turned and true-fil'd lines" we see but an authentic reflex of his beautiful "mind and manners;" and avers that he "honors his memory only on this side idolatry." As a slight shadow on this pleasing picture, it has been shrewdly surmised that he was not very happy with his wife. Evidence of this has been sought in certain passages in his dramas; but obviously any inference from these is most precarious. The neglect of her in his will, except in one curt clause interlined, dismissing her with a legacy of "his second-best bed," might well seem much more decisive, till Mr. Charles Knight greatly reduced its importance by showing that, the will apart, by the mere operation of the English law, the poet's widow was entitled to *dower*, and thus amply provided for. There is thus (though the query of why *second-best*, if a bed at all was to be left her, may perhaps have a certain pertinence) no very firm basis of proof for the domestic unhappiness of Shakespeare. Still, if anything in his life is certain, it is this, that, spending great part of his time in London, the poet did not find it essential to his felicity there to have the society of his wife; as probably she, on the other hand, though her husband had gone to the metropolis, was content to abide in Stratford, since it seemed to him the desirable arrangement. It is fair, we think, to infer from this that the affection subsisting between the two was a little on the hither side of enthusiasm.

To discourse here at this date of the genius of Shakespeare would be only to promulgate platitudes. The lofty eulogy of Dryden—"He was the man who, of all modern and perhaps ancient poets, had the largest and most comprehensive soul"—has since been generally acquiesced in. As dramatist, he is admittedly in the world without a peer; as poet (abstracting the differential forms), there are but one or two names in literature even to be named beside his; and dismissing his claims in either kind, we have in his works such a treasury of gnomic wisdom on all matters of human concernment as no other writer has ever bequeathed to the world. If we add, that this greatest of writers is one of the most unequal—that his works contain more than might be wished of what, as the product of such a mind, we need not scruple to call rubbish—and that nearly every vice in writing might be illustrated from them almost at will, we say simply what is patent to every reader not blinded by the stupid and mindless idolatry which too often of late in many quarters has displaced a rational admiration.

The only works of Shakespeare certainly published under his own hand were the two poems *Venus and Adonis* and *The Rape of Lucrece*, which appeared in 1593-94 respectively. As was naturally to be looked for in the case of pieces on the stage so popular, certain of his dramas found their way from time to time into print, but no authoritative edition of any of them was issued during his lifetime. The first collected edition of his dramas was issued in 1623, by Heminge and Condell, his friends and co-proprietors in the Blackfriars and Globe theaters. A second edition followed in 1632; a third, in 1664; and a fourth in 1685. In 1709 appeared the edition of Rowe, with a prefatory sketch of the poet's life. Of the "Shakespearian literature" which followed, and the various re-issues of the dramas, with such masses of critical commentary and emendation as no other writer has ever perhaps been made the subject of, it would be hopeless to attempt an account. It must suffice to mention as successive editors Pope, Theobald, sir Thomas Hanmer, Warburton, Capell, Stevens, Malone, and Dr. Johnson, whose elaborate introductory essay—whatever may be thought of the insolence of much of his criticism of the plays in detail—is perhaps on the whole, as an estimate of the genius of the poet, as satisfactory as any that has since been written. Down to our own time, there has been no remission of activity in this field of literary labor. More recently, the intelligent industry of Mr. Charles Knight specially deserves mention; and along with his may be given the names of Mr. Dyce, Mr. John Payne Collier, and Mr. Singer—all of whom have put forth elaborate and valuable editions of the dramas. An important edition was issued from Cambridge in 1863-66, under the superintendence of two gentlemen of unquestioned scholarly competence, W. G. Clark and W. Aldis Wright.

In Germany, Shakespeare has long been thoroughly naturalized; and the German enthusiasm in regard of him is, if possible, even greater than our own. It was the celebrated Lessing who first decisively introduced him to notice in a series of essays, exhibiting the immeasurable superiority of his art to that of the pseudo-classical models of the French stage. Since his time, many of the most gifted of his countrymen have devoted themselves to the work of Shakespearian criticism and elucidation. From Goethe we have some exquisite fragments, most notably the criticism of *Hamlet*, occurring in his *Wilhelm Meister*; and after his, the names of Tieck, A. W. Schlegel (whose *Lectures*, of date 1809-1811, almost constitute an era in this special department of literature), Franz Horn, and Gervinus (an English translation of whose elaborate commentaries has been published, occur as the most illustrious in connection with the present topic. By Tieck and Schlegel together, the work of translation was undertaken; and the result of their joint labors, which takes rank as the standard German Shakespeare, ranks also, in the opinion of competent judges, as a consummate and almost *unique* specimen of excellence in the translator's art. It has not unfrequently been alleged that, till the Germans made the discovery for them, the English people knew nothing of the greatness of Shakespeare. This is on the face of it ridiculous. The single sentence we have cited from Dryden, and the practical acceptance of it implied in the unexampled attention and industry

which never ceased to be directed to the subject, sufficiently of themselves confute so idle a notion. What the Germans really did (and along with their services in the matter, must be included those of our countrymen Coleridge, whose impulse and point of view, at least, if not something considerably more, were derived from German sources) was somewhat to methodize and enlighten for us an admiration never deficient, but always, like Jonson's regard for the memory of his friend, "only on this side idolatry." The old notion of Shakespeare was that of a genius in power and plenitude unrivaled, but licentious in its modes of operation, and more or less chaotic in its results; "wild above rule or art, enormous bliss." The new German criticism exhibited in the chaos the orderly outlines of a world; co-ordinated the confusion under rules till then unsuspected, and showed in what before had seemed irregular exercise of power admitted to be magnificent, obedience not less magnificent to a law of artistic evolution. It made calculable, in a word, the orbit of a luminary which had somewhat uncomfortably seemed to be sweeping at random through space. But the English people did not need it to *reveal* the luminary to them; throughout and from the first, they had seen and devoutly worshiped it. Also, to a great extent, it is due to the German enthusiasm of exposition, that over the whole continent, and wherever literature is intelligently studied—some little lingering, dying remnant of French prejudice except—the poet *par excellence* of England is now finally enthroned as the poet *par excellence* of our whole modern world and civilization. A household edition of the works of Shakespeare, freed from objectionable passages, has been published by W. and R. Chambers, in 10 volumes.

SHALE, or SLATE-CLAY, an indurated clay, which often forms beds in the coal measures. It is chiefly composed of silica and alumina, in variable proportions, but also frequently contains a considerable amount of carbonate of lime and of oxide of iron. It is of a gray or grayish-black color, or brownish-red when containing much iron. Its structure is more or less slaty. It is soft, and easily reduced to powder. It is used for making slate-pencils. When free from lime and iron, it is reduced to powder, and used for making fire-bricks, for which it affords an excellent material. Shale very often contains a notable quantity of bitumen, and when this is so much the case that the mineral has a shining resinous streak, and crackles and blazes in the fire, emitting a black smoke and a bituminous odor, it is known as *bituminous shale*. This variety sometimes passes on the one hand into common shale, and on the other into coal. Impressions of ferns and other plants are very frequently found in shale.

Slate, Schist, and Shale are names employed to denote those kinds of rock which are laminated or fissile—that is, which possess a structure readily splitting into thin layers. Slate and schist are almost synonymous, although the latter should be restricted to rocks with their layers irregular or foliated. True slate differs from them in not having its lamination produced by bedding. See SLATE. Nevertheless, all three names are often applied to the same substance.

Shale varies much in its composition. Clay, sand, lime, bitumen, and other bodies, either singly or any mixture of them, are included under the name, if they form rocks which split into layers in the direction of their bedding; clay, however, being an ingredient in most shales. Strange as it may seem, the line between even coal and some kinds of shale is not well defined; and in the case of the Torbanhill mineral, found near Bathgate, the question by which of the two names it should be called led to a lengthened and costly litigation.

The importance of certain decomposing shales through which sulphuret of iron is disseminated, for the manufacture of alum, has been long known, and the quantity raised for that purpose from the carboniferous beds of Lancashire and Lanarkshire and the lias beds of Yorkshire is very considerable, yielding about 16,000 tons of manufactured alum annually. Shales of a similar kind are worked in France, Germany, and North America.

Bituminous shales—that is, shales more or less rich in carbon and hydrogen—form another class of these bodies which have, in recent years, attracted much notice as sources of oil for illuminating purposes. It is now more than thirty years since a Frenchman, named Du Buisson, introduced a method of distilling certain bituminous shales in France, at a comparatively low temperature, so as to obtain burning-oil and other products. The process was afterward tried in England, being used for a time in distilling a Dorsetshire bituminous shale, sometimes called "Kimmeridge coal." From this mineral a burning oil, a lubricating oil, and a naphtha for dissolving caoutchouc, were obtained. But neither in France nor in England did the attempt to make a profitable manufacture succeed; in the former country the poverty of the shales was the chief drawback; in the latter, the disagreeable smell of the oil, which could not be effectually removed, prevented it from obtaining favor in the market.

On account of these failures the process fell into abeyance, until it was revived again by the success of the well-known patent of Mr. James Young (see NAPHTHA), secured in 1850 for the production of paraffine and paraffine oil from coal. With the exception of the solid paraffine, which Mr. Young was the first to obtain on the large scale, and the employment of coal instead of shale, the processes of Du Buisson and Young are essentially the same. This process has created a new and rapidly-increasing branch of industry, paraffine oil and paraffine being economically obtained by it from either coal or shale.

of certain kinds. Those who have paid any attention to the various beds of minerals which go to form what is geologically called the coal measures are aware that it is only the seams of coal, ironstone, fire-clay, sandstone, and limestone which until very lately have been looked upon as of any industrial importance. Interstratified between these and the other minerals of the series are numerous beds of carbonaceous or bituminous shale, until recently considered useless. Many of these shales were found upon trial to yield from 30 to 50 gallons of crude oil per ton; and works—several of them of great size—have accordingly been started in many places over the entire area of the coal formation in Scotland, and also at various localities in England and Wales, for the manufacture of mineral oil, paraffine, etc., from this material.

Owing partly to the comparative cheapness of shale, and partly also to the fact that these products are obtained from it in a state more easily purified than when they are got from coal, the use of the latter as a source of them is now almost entirely given up. In Scotland, where the manufacture of paraffine oil is chiefly carried on, the shales used are called "oil shales," and it is estimated that there are now 800,000 tons of this material annually distilled. Such a quantity yields the following products:

Crude oil.....	25,000 gallons.
Paraffine.....	5,800 tons.
Lubricating oil.....	9,800 "
Sulphate of ammonia.....	2,350 "

In the refining process the crude oil is reduced to about one-half of its bulk before it is fit for burning. Besides the above, there is also a considerable quantity of "coal gas," unavoidably produced, and partly wasted. But for the distance of the oil works, this would be consumed in some of the larger Scottish towns. Shales found in the Lias and some other formations, likewise yield mineral oil.

SHALER, ALEXANDER, b. Conn., 1827; in 1845 entered the New York state militia and at the beginning of the rebellion was maj. of the 7th regiment N. G. S. N. Y. In 1861 he became lieutenant of volunteers; he served in the Peninsular campaign, with Pope and McClellan, at Fredericksburg, Marye's heights, Gettysburg, and Rappahannock; was captured in the battle of the Wilderness, and exchanged, Aug. 1864. At the end of the war he received the brevet rank of maj.gen., and in 1867 was made maj.gen. of the 1st division of the New York state national guard.

SHALER, NATHANIEL SOUTHGATE, b. Ky., 1841; graduate of Lawrence scientific school, Cambridge, 1862; director of the geological survey of the state of Kentucky, professor of paleontology at Harvard university, and assistant at the museum of comparative zoology. He published reports of the Kentucky survey, and has written numerous articles on geological and other scientific subjects.

SHALLOON', a light worsted cloth, said to have been first made at Chalons in France, and to have derived its now corrupted name from that place.

SHAL'LOP (Fr. *chaloûpe*), a large, open, old-fashioned boat, carrying two masts, rigged as in a schooner. Its principal use was in the fisheries, but it has now nearly given place to luggers and yawls.

SHALLOT, *Allium Ascalonicum*, a species of *allium* (q.v.), a native of the east, introduced into Europe by the crusaders—from Ascalon, it is said—and much cultivated for its bulbs, which are used like those of the onion, and sometimes for its leaves, which are used like those of the chive. The leaves grow in tufts like those of the chive, but are larger. The shallot is generally propagated by the cloves, which are planted just beneath the surface of the ground, or only partially beneath it, in spring, and the crop is ready for gathering in July or August. The flavor resembles that of garlic, but is much milder. In the vineyards of Italy the shallot is naturalized.

SHAMA'KA, a t. in the government of Transcaucasia, Russia, containing two villages 15 m. apart. The old town was razed to the ground in 1737 by Nâdir Shah, but has been rebuilt, and now has about 25,000 inhabitants. The place is noted for its extensive silk manufactures.

SHAMANISM is the ancient religion of the Tartar, and some of the other Asiatic tribes. It is a belief in sorcery, and a propitiation of evil demons by sacrifices and frantic gestures. The following account of it is extracted from the *Asiatic Journal*. The priests are men or women, married or single. The character is acquired by pretending that the soul of a deceased priest has appeared to the individual in a dream, appointing him or her his successor. If the priests are in function, they wear a long robe of elk-skin, hung with small and large brass and iron bells; moreover, they carry staves carved at the top into the shape of horses' heads, also hung with bells; and with the assistance of these staves they leap to an extraordinary height. The followers of the Shaman religion have neither altars nor idols, but perform their sacrifices in a hut raised on an open space in a forest or on a hill. Nor are there fixed periods for the performance of their ceremonies; births, marriages, and sickness, uncommon appearances in the atmosphere, or public calamities, are generally the occasions which call for them. The animal to be sacrificed

is generally fixed upon by the shaman or the donor; and after the persons uniting in the ceremony have assembled, the shaman enters the hut, chanting certain words, sprinkles on all the sides of the hut, and over the fire, spirits and milk, and then orders the animal to be killed, which is done by its heart being torn out. The skin of the victim is then stripped off, and its flesh, with the exception of a few pieces which are thrown into the fire, is consumed by the persons assembled. See also LAMAISM.

SHAMMAI (not, as has often been done, to be confounded with Sammeas), an eminent doctor of the Jewish law at the time of Herod, head of a most important school, and supreme judge of the sanhedrim (ab-beth-din) during the presidency of Hillel (q. v.), along with whom he is, indeed, generally mentioned, and of whom he was, as it were, the very counterpart. Very little is known of the history of his life. He most probably was born in Palestine, and most energetically participated in all the political and religious complications of the country. There was a harshness and rigidity in his character which contrasts most strikingly with Hillel's proverbial patience. His religious views were painfully strict, and he even tried to extend the rigor which he imposed upon himself, to the youngest children; but the zealotism with which later times have charged him is not his, but his school's, "the House of Shammai," as it was called. This seems, under the adverse circumstances of the commonwealth—sedition within, and the approaching enemy without—to have developed a fanatical zeal that at times surpassed all bounds, and chiefly tended to foster that exceptional exclusiveness which proved both the bane and the saving of Judaism. The discussions of the two rival schools, of which that of Shammai preponderated long after the master's death, turned exclusively upon points of positive law. There is only one curious metaphysical debate recorded, viz., whether, as one school held, "it was better for man to have been created or not;" or, as the other asserted, "it would have been better if he never had been created." Finally, they both agreed in the latter axiom, but with the addition—"but since he is now in this world, let him be careful in his actions. We need hardly point to the strange light which this discussion and final decision throw upon the times of unequaled national misery that begot them.

SHAMMY. See LEATHER.

SHAMO, or **Gobi**, the Chinese and Mongol names respectively for a wide region of steppe and desert in the eastern part of central Asia. It extends from the Thian-Shan mountains to the Kuen-Lun and Nan-Shan mountains, bordering on eastern Turkestan to the w., and occupying great part of the area between 40° and 45° n. lat., and 90° to 118° e. long. The "desert" is by no means sterile throughout. On the n. and on the s. is a wide belt of firm steppe, consisting for the most part of vast green levels covered with abundance of pasture, but broken by numerous ridges of hills. Between these two belts, each at a height of from 4,500 to 5,500 ft. above the sea, lies a depressed tract, not more than 2,500 to 3,000 ft. above sea level, and varying in breadth from 230 to 460 miles. This alone is properly called Shamo, or "sea of sand;" it is a perfect wilderness of sand and stones, and is probably the bed of an ancient sea. The salt sand of which its soil is mainly composed produces nothing but a few scrubby plants. The fauna of the Shamo, even in the wider sense, is limited, including little save hamsters, dziggetais, a few wild sheep, and antelopes. There are no fixed habitations even in the steppe country; the inhabitants, chiefly Mongols, are all nomads. Yet in various places there are traces of ancient cities buried in the shifting sand (see *Ocean Highways* for 1873). The winter here is intensely cold and stormy, and the summer excessively hot. Yet the wandering hordes of Mongols have no difficulty in keeping large herds, which find plenty of rich pasture on the steppes, and even in winter contrive to pick sufficient food from beneath the snow. From want of wood the nomadic tribes have to use dried dung as fuel. Little is known of the Shamo save in the neighborhood of the main tracks across it, of which the chief is from Maimatchin to Pekin.

SHAMOKIN, a borough in e. Pennsylvania, on a branch of the Philadelphia and Reading railroad; pop. '75, 7,500. It is in Coal township, on Shamokin creek, 95 m. from Philadelphia, and 19 m. s.e. of Sunbury, with which it is connected by a branch of the Northern Central railroad. It is in the anthracite coal region, and has several valuable mines which furnish material for the principal industry. In one year the product of the mines was 1,250,000 tons. It is well laid out. Many of its buildings are built of brick. It is lighted by gas, has 10 churches, is supplied with water carried 4 m., has 2 newspapers, public schools, 2 private schools, several hotels, and manufactures of iron and machinery.

SHAMROCK, a national emblem of Ireland, a leaf with three leaflets, or plant having such leaves, sometimes supposed to be the wood sorrel, but more generally believed to be some species of clover, or perhaps some common plant of some of the nearly allied genera, as the bird's-foot trefoil, or the black medick. It is not improbable that the name has a sort of general reference to plants with trifoliate leaves, and that a more exact determination of the species may be as difficult as the attainment of botanical accuracy in regard to the emblematic thistle of Scotland.

The small-leaved clover (*trifolium repens*) has had a superstitious respect attached to it from early times. According to the elder Pliny no serpent will touch it. It is said

to have been first assumed as the badge of Ireland from the circumstance that St. Patrick made use of it to illustrate the doctrine of the Trinity. See TREFOIL.

SHAMYL, or **SCHAMYL** (Eng. "Samuel"), the celebrated leader of the independent tribes in the Caucasus, was born at Aul-Himry, in northern Daghestan, and belonged to a wealthy Lesghian family of rank. He was one of the zealous disciples of Kasi-Mollah, the great apostle of Muridism, and ably seconded his endeavors to compose the numerous feuds of the various Caucasian tribes and unite them in a bond of antagonism to their common enemy, the heretical Russians. He was one of the foremost in the defense of Himry against the Russians, Oct. 30, 1832, and, after the fall of his chief Kasi-Mollah and most of his adherents, fought his way alone and severely wounded through the besiegers' ranks. After the assassination of Hamzad-Bey, the successor of Kasi-Mollah, in the end of 1834, Shamyl was unanimously elected "imam," and being absolute temporal and spiritual chief of the tribes who acknowledged his authority, he made numerous changes in the religious creed and political administration for the purpose of more fully concentrating in himself the whole power. These changes were certainly the chief cause of the great successes which subsequently attended the mountaineers, but it is none the less certain that they produced that sudden collapse of the spirit of independence which took place when the great leader was removed. Shamyl's change of military tactics from open warfare to surprises, ambuscades, etc., brought numerous and sometimes great successes to the arms of the mountaineers. Gen. Ivelitch was severely defeated in 1837, the worst reverse the Russians had yet sustained, and his coadjutor Ilali was forced to make a disastrous retreat. They succeeded, however (1839), in hemming Shamyl into Akulgo, in Daghestan, took the fortress by storm, and put every one of the defenders to the sword, in order to be quite certain that Shamyl should not escape. How he did so is not known, his own followers and the Russians believed him to be dead, when, to the joy of the one and the bitter confusion of the other, he suddenly appeared, preaching with more vigor than ever the "holy war against the heretics." In 1843 he conquered all Avares, besieged Mozdok, foiled the Russians in their subsequent campaign, and gained over to his side the Caucasian tribes which had hitherto favored Russia. This accession of power rendered necessary some change in the government; a civil and a criminal code were promulgated, a regular system of taxation established, and Dargo was made the capital of this Caucasian monarchy, the population of which now (1844) exceeded 1,000,000. But the Russians, under prince Weronozoff, having changed their tactics, assailed the country on various points at the same time, and the advance gained was secured by chains of forts. The fortune of war, however, steadily alternated till 1852, when Bariatinsky compelled Shamyl to confine himself to the defensive, and deprived him of his victorious prestige. Some of the tribes now returned under Russian authority, and Shamyl (probably owing to his diminished power and resources) was unable to take advantage of the diversion in his favor afforded by the Crimean war, after the conclusion of which the Russians resumed their attacks with more energy, opened a road over the mountains, thus cutting off one portion of the patriots and compelling their submission. The following year was still more disastrous; 100 villages were destroyed, the inhabitants transplanted to Russian districts, and Shamyl himself defeated, Aug. 11. On April 12, 1859, his chief stronghold, Weden, was taken after a seven weeks' siege, and his authority, except over the small band of followers who still devotedly adhered to him, was wholly destroyed. For several months he was a mere guerrilla chief, hunted from fastness to fastness, till at last (Sept. 6, 1859) he was surprised on the plateau of Gounib, and after a desperate resistance, in which his 400 followers were reduced to 47, he was captured. His wives and treasure were spared to him, and he was sent to St. Petersburg, where he experienced a generous reception from the czar. A few days afterward he was assigned a residence at Kaluga, with a pension of 10,000 rubles. Thence he went in 1870 to Mecca, remaining a parole prisoner of the Russian government; and died at Medina in Mar., 1871, in the 74th year of his age.

SHANGHAI, the most important maritime city of China, situated on the left bank of the Hwangpoo or Woosung river, 12 m. from where it debouches into the southern portion of the mouth of the Yang-tse-Kiang, in lat. $31^{\circ} 14' N.$, and long. $121^{\circ} 33' E.$ Though it is now one of the first emporiums of commerce in the east, only a quarter of a century ago it was but a third-rate Chinese town. It is a *keen* or *district* city, having a wall 3 m. in circuit, through which 6 gates open into extensive suburbs. The low alluvial plain on which it is situated is of great extent, and intersected by innumerable creeks, which environ the walls, and permeate the city in various directions. It is a dirty, poorly-built town, the houses are brick, the streets are very narrow, and constantly crowded with people. Few of the buildings rise above the low walls of the city; the only conspicuous objects are the Roman Catholic cathedral, a massive edifice, and the lofty spire of the Baptist chapel. The temples present the same general appearance met with in all Chinese cities. Every city has its ching-hwang, or temple of the tutelary gods: that of Shanghai is in a picturesque position on a rocky islet, surrounded by a serpentine sheet of water, which is crossed by zigzag bridges. A little further down the river stand the foreign settlements, English, French, and American. The whole of the mercantile *hongs* are built upon the English concession; while the French concession is mainly occupied by *go-downs*, wharves, and

Chinese houses. There are no French merchants in Shanghai. The river in front of the Chinese town is thronged with junks, lashed side by side for a couple of miles. The reach in front of the foreign settlement was formerly crowded with sailing-vessels; but since the opening of the Suez canal, the steamers of the P. and O. steam navigation company and of private companies have largely taken their place. Lower down are the ship-yards, machine-shops, and dry-docks, which foreign commerce has called into existence; and here the Chinese government has at work an arsenal where war-vessels of the largest tonnage are built and equipped. Under the arrangement by which the foreign custom-house dues are collected by foreigners, facilities have been created for the navigation of the Yang-tse by stationing a light-ship, buoys, and signals, rendering safer the approach to this important mart. One or two light-houses have also been recently erected, giving additional security to vessels entering and leaving the port. There are a chamber of commerce, reading-room, library, and literary institution—nothing being wanting to render the port of Shanghai the metropolis of eastern commerce. The municipal government of the foreign settlement is highly creditable to the mercantile traders. Several gentlemen are elected annually by the land-holders, for the purposes of local government—police, public improvements, and repairs requiring much management, and entailing much expense, the funds for which are obtained by taxation. Shanghai is also the seat of various missions for converting the natives—the schools, dispensaries, and other benevolent objects meeting with generous support from foreign merchants. The products of Shanghai itself are not of much value, but the city is a most important entrepot for goods passing between the n. and s. provinces of China, as well as for the imports and exports from and to foreign countries. It was in the possession of the Tae-ping rebels from 1853 to 1855, and the prosperity both of the native town and the foreign settlements was in peril for a time; but it enormously advanced after their expulsion—the English quarter in particular becoming a refuge for the Chinese from all parts of the province of Kiang-su, which the Tae-pings continued to desolate up to 1862. The trade of the port increased threefold between the years 1860 and 1863; and this increase was due in a great measure to the large and increasing trade from the ports opened on the Yang-tse in Chinese produce of all descriptions. In 1875 the entrances and clearances at the port were 3,854 vessels, of 2,594,171 tons; the imports, foreign and coastwise, amounted to £13,992,298; and the exports to £10,330,340. The articles of import and export are of a most miscellaneous description; the chief articles of import being opium, English cotton and woolen goods, and metals; and of exports, tea and silk. Great quantities of the opium imported into Shanghai are re-exported to the other parts of China. The mercantile importance of Shanghai has increased greatly through the opening of the Yang-tse river to commerce. In 1876 the first railway in China was opened from Shanghai to Kangwang, but it has since been bought up by the government and closed. The population is estimated at 250,000.

SHANNON, the largest of the rivers of Ireland, rises in the Cuilcagh mountains, county of Cavan, and after a course of 230 m. falls into the Atlantic ocean between the headlands of Loop and Kerry Head. It is commonly divided into two portions, the upper Shannon from its source to Limerick, and the lower Shannon from Limerick to the sea, a distance of 56 miles. In its upper course it passes from its source in Cavan to lough Allen in the county of Leitrim; thence through a difficult channel, where the navigation is in part transferred to a canal, to a small extension called Corry lough, and with alternations of river and lake, to lough Forbes, in the county of Longford, on leaving which the river for a time attains an average width of 250 yards as far as Lanesborough. Here it is again merged in a lake called lough Ree, which stretches 10 m. southward to within 2 m. of Athlone. At this point great natural difficulties have been overcome, and the course of the river, by Shannon harbor and Portumna, and through the picturesque lough Derg to Killaloe, has been so deepened and improved that a regular passenger and goods traffic is maintained. From Killaloe to Limerick the navigation, owing to the rapid fall, is again in part transferred to a canal. On approaching Limerick the river divides into two branches, and on the island thus formed stands what is known as the Irish town, in contradistinction to the English town, of Limerick. From the city, where an extensive and commodious range of quays has been built to the sea, the Shannon is navigable to sea-going vessels; and though near the city very shallow at low water, the navigation for the last 40 m. is free at all times of the tide. The entrance between Kerry Head and Loop is 7 m. across. About 10 m. from the entrance the river narrows to about a mile and a half in width. At present, however, the outward navigation commences at Poynes, which is connected by railway with Limerick, and from which steamboats daily ply to Kilrush, Tarbert, and the intermediate stations. Several rivers of considerable size fall into the Shannon during its course, as the Suck, the Brosna, the Fergus, the Maigue, and the Feale. The improvement of the Shannon was commenced under the Irish parliament. In 1837 the work was placed under a board of commissioners, by whom a sum of more than half a million was expended. It has since been transferred to the board of works or local government board. The navigation is open from the head of lough Allen to Limerick, a distance of 143 m. in a direct course, but by the addition of the Boyle branch of 9 m., and the Strokéstown branch of 6 m., a total length of river and canal navigation of 158 m. is now open, over 129 m. of which

large river-steamers freely ply. This important system of navigation, which occupies a position almost midway between the e. and w. coasts of Ireland, is connected with Dublin by means of the Grand and Royal canals. The amount of tolls, etc., received in 1879 was £2,791; and in 1875-6, £3,809; expenditure in 1875-6, £3,274.

SHANNON, a co. in s. Missouri, drained by the Current river and Jack's fork; about 1000 sq. m.; pop. '80, 3,441-3,430 of American birth. The surface is hilly and heavily wooded. The soil is fertile. The principal productions are hay and corn. Co. seat Eminence.

SHANNY, a species of acanthopterous fish belonging to the family *blenniæ* or blennies. See **BLENNY**, *ante*. The shanny is *blennius pholis*. In this species all the rays of the dorsal fin are of nearly equal length except the eleventh and twelfth, which are short. There are 31 dorsal rays, 13 pectoral, 2 ventral, 19 anal, and 11 caudal. The color is very variable, of shades of brown. They are distinguished from other species by the absence of appendages of the head.

SHAN-SE' (West of the Hills), a province of n.w. China, is of rugged surface, and lies on the western limits of the plain. In the n. are imperial hunting-grounds. It supplies the purest iron ore and the best coal in China, besides cinnabar, copper, marble, and other minerals.

SHAN STATES, a number of tributary states in Indo-China, lying between Munnipur on the w. and Yun-nan on the e., and from the parallel of 24° n. lat. s. to Bangkok and Cambodia. Of these the northern states are tributary to Burmah (q.v.) and the southern to Siam (q.v.). A great portion of the mountainous region of these states is called the Laos country. The Laos races are divided into two curiously distinct subdivisions. The northern race, beyond the northern frontier of Siam, are called *black-bellies*, from the circumstance that they tattoo themselves with figures in ink, printed on their bodies with sharp needle-like points; the southern race, mostly on and within the eastern frontier of Siam and tributary to that kingdom, are called *white-bellies*, and do not tattoo. Xiang Mai, the capital of Laos, stands on a wide plain on the right bank of the Meinam, 500 m. n. of Bangkok, and is said to contain 50,000 inhabitants. The number of Laocians included in Siam alone is estimated at 1,000,000. They are meek, gentle, unwarlike, and superstitious. Their chief employment is agriculture; and the principal crops raised by them are rice, maize, the sweet potato, calabashes, red pepper, melons, and other fruits. In religion they are Buddhists.

SHAN-TOONG, a province in n.e. China, on the Yellow sea; 65,100 sq. m.; pop. 41,700,621. The surface is very mountainous and not very fertile. The principal river is the Hoang-Ho, emptying into the gulf of Pe-chi-li; the province is traversed also from s. to n. by the great canal. The products are millet, wheat, indigo, silk, and hemp. The chief towns are Tsi-nan, the capital, Yen-chow, Tsing-chow, Sai-chow, and Wooting.

SHA'PINSHAY, one of the Orkney islands, about 5 m. n.e. of Kirkwall. It is 5 m. long and 4½ m. in extreme breadth. The fine natural harbor of Elwick bay on the s. side is overlooked by a pleasant modern village. Pop. '71, 949.

SHARI, (i. e., *river*), the principal feeder of lake Tsad or Tehad (q.v.).

SHARJA, a t., capital of the province of Sharja, Arabia; on the Persian gulf, about 215 m. n.w. of Muscat; pop. estimated at 25,000. The harbor is poor, but the port is the chief import city for Persia. Weaving is the main occupation of the inhabitants, and quantities of the oriental tapestries, cloaks, curtains, carpets, etc., are made. The principal building is the government treasury.

SHARK, *Squalus*, a Linnæan genus of cartilaginous fishes, now forming in Müller's system a suborder of *plagiostomi* (q.v.) and divided into a number of families and many genera. The sharks have generally an elongated form, tapering gradually to the tail, and not much thickened in the middle. The muzzle projects over the mouth; the nostrils are situated on the under-side of the muzzle. The males have claspers. The gill-openings are lateral. There is no cartilage between the snout and the pectoral fin, as in the rays. Some of the sharks are ovoviviparous; others lay eggs, generally a pair at a time, more being produced in succession. The eggs are large in comparison with those of osseous fishes, and are of a square or oblong form, with a tough horny coat, each corner prolonged into a tendril, the tendrils being apparently of use for their entanglement among sea-weeds. These eggs, or at least their empty cases, are very frequently cast up by the waves on the sea-beach, and are popularly known as *sea purses* or *mermaids' purses*. Near the head of the inclosed embryo there is a slit in the case through which water enters for respiration, and there is another at the opposite end, by which it is discharged. The young fish ruptures the case at the head, where it is weaker than at any other part, and on issuing from it, carries a yolk bag attached to its belly for its nourishment until it is able to seek food. At this stage of its existence, its respiration is also aided by filaments projecting from the gills through the gill-openings, which are absorbed as it grows older. The teeth are generally large, sharp, and formed for cutting, with the edge often serrated; but in the genus *cestracion* (q.v.) the teeth are

pavement-like; and in some genera they are small and numerous. The angel-fish (q.v.) is ranked among the sharks, but differs from the rest in its flattened form. Some of the smaller sharks are popularly known by the names dogfish, bound, tope, etc. In the articles Cestracion, Dogfish, Fox Shark, Hammer-head, Porbangle, and Tope, some of the shark tribe are noticed. It only remains here to notice a few of the more interesting of those which do not come under any of these heads.

The WHITE SHARK, *Carcharias vulgaris*, is the most dreaded of all the monsters of the deep. The family *carcharidæ*, to which it belongs, have two dorsal fins, the first dorsal placed over the space between the pectoral and ventral fins; they have a nictitating membrane; and have no spout-holes. In the genus *carcharias* the snout is flattened. The white shark attains a great size; one has been caught of 37 ft. in length. The body is covered with a hard skin, and is grayish-brown above and whitish below. It is a very rare visitant of the British coasts, if indeed another species has not been mistaken for it; but is found in the Mediterranean, and is plentiful in the seas of many of the warmer parts of the world, often following ships to feed on any animal substance that may be thrown or may fall overboard, and often in its indiscriminate voracity swallowing things which are indigestible. A lady's work-box has been found in a shark's stomach; and the papers of a slave-ship, which had been thrown overboard, in that of another. Human beings are not unfrequently its prey, and a large shark is not only capable of biting off the limb of a man, but of snapping the body in two, and has even been known to swallow a man entire. Its head is large, the mouth large and wide; furnished with a terrible apparatus of teeth, of which there are six rows in the upper jaw and four in the lower; the teeth are triangular, sometimes 2 in. in breadth, sharp-edged, and serrated; when not in use they are laid back in the mouth, nearly flat, but when the shark bites they are brought up—or at least those of the outer rows—by means of muscles with which each tooth is independently provided. The tail, as in all the sharks, is heterocercal, but its lobes are more nearly equal than in most of them. The shark is often captured by sailors, by means of a great hook baited with a piece of meat, and attached to a chain, as the shark's teeth readily bite through any rope. When the shark is hooked and hauled on board, great care is requisite to avoid danger both from the mouth and from the tail, the powerful action of the latter being generally interrupted by a sailor springing forward and cutting it above the fin with a hatchet. A curious method of catching the shark is practiced in the South Sea Islands; a log of wood is set afloat with a strong rope attached to it, at the end of which is a noose, and the sharks gathering about it as if from curiosity, one of them may be expected soon to get its head into the noose, and is at last wearied out by the log. Formidable as the shark is, men have sometimes successfully braved it in its own element, watching its turning—as from the position of its mouth it must do—to seize its prey, and stabbing it in the belly.

The BLUE SHARK, *Carcharias glaucus*, is much smaller than the white shark, seldom exceeding 8 ft. in length. It is also of a more slender form. The upper parts are of a blue color, the belly white. This species is common in the Mediterranean and in the warmer parts of the Atlantic. It is not unfrequent on the south-western coasts of England in summer, apparently coming in pursuit of pilchards, and often doing great mischief to the nets and lines of fishermen, its sharp teeth biting through a net or line with the utmost ease.

The BASKING SHARK, *Selache maxima*, belongs to the family *lamnidæ*, having two dorsal fins, spout-holes, and no nictitating membrane. The snout of the basking shark is short and blunt; the teeth are small, numerous, conical, and curved backward. The skin is much rougher than in the white shark and blue shark. This species attains a great size, being sometimes 36 ft. long, but it is not so thick in proportion as the white shark. It is of a blackish-brown color, glossed with blue. It does not exhibit a ferocious character, and is supposed to feed on medusæ, crustaceans, and the like. It is often seen swimming slowly with its dorsal fin above the surface of the water, whence it has obtained the name of *soil-fish*. It permits itself to be quite closely approached by a boat, but on being struck with a harpoon it plunges suddenly down, and swims off with great rapidity, so that its capture is attended with danger. It is not uncommon on the northern and western coasts of Britain.

The GREENLAND SHARK, *Sequanus borealis*, is of the family *scymnidæ*. It has large spout-holes, two dorsal fins, no anal fin, and no nictitating membrane. It inhabits the northern seas, and is rarely seen so far south as even the northern Scottish islands. It attains a length of 14 feet or more, is thick, and tapers suddenly at the tail; the fins very small; the teeth in both jaws so arranged as to diverge from a center. It bites and annoys whales, but feeds also on small fishes and crustaceans. When a whale has been killed, a shark will often come even whilst men are occupied in cutting off the blubber, and scoop out one great lump after another, and will return to its repast after having been severely wounded.

The rough skin of sharks is employed by joiners for polishing fine-grained wood, and for covering the hilts of swords to make them firmer in the grasp. The flesh is coarse, but is sometimes eaten. The fins abound in gelatine, and are much used by the Chinese for making a rich gelatinous soup. Dried sharks' fins are a considerable article of import into China. The liver yields a large quantity of oil, which is now also, in some

parts of the world, an article of commerce. For the sake of this oil a shark fishery is prosecuted on the coast of Ceylon.

Fossil sharks make their first appearance in the oolitic rocks, from which eight species have been described. They become more numerous in the cretaceous deposits, in which no less than 60 species have been found. In the tertiary strata, their remains are still more abundant. But as the determination of fossil species depends entirely on the teeth, which, with the exception of the spines and vertebrae, are the only portions preserved, it is probable that the species and genera are too greatly multiplied.

SHARON, a borough in w. Pennsylvania, in Mercer co. on the Shenango river; pop. 6,500. It is on the Erie and Pittsburg railroad, at the s.e. terminus of the Mahoning division of the Atlantic and Great Western railroad, connecting it with Cleveland. It contains 9 churches, 4 hotels, a fire department, a masonic hall, 4 banks, a national and a savings bank, public schools, a daily newspaper and 2 weeklies. It is in the vicinity of rich coal mines, and contains manufactories of iron, lumber, and nails, 6 blast furnaces, 2 extensive foundries, and machine-shops.

SHARON, WILLIAM, b. Smithfield, Ohio; studied law, went into the banking business in Nevada, was trustee of the bank of California in San Francisco, amassed a large fortune in Nevada silver mining, and was elected U. S. senator from Nevada in 1876.

SHARON SPRINGS, a village of Sharon township, Scholarie co., N. Y., about 60 m. n.w. of Albany, on a branch of the Albany and Susquehanna railroad; pop. 70, 520. The place is noted as having several mineral springs of medicinal value. It lies in a beautiful valley and is a pleasant resort.

SHARP, a sign ♯ in music, which, when prefixed to a note, elevates it by a semitone

in the scale, raising, for example, F  to F sharp . When placed at

the beginning of a piece of music, it denotes that all the notes on the line or space on which it is placed, and their octaves above and below, are to be played sharp. A double sharp × raises a note two semitones.

SHARP, GRANVILLE, 1734-1813; b. England; abandoned the study of law for a place in the ordinance office. He soon became interested in behalf of the slave. West India planters being accustomed, after bringing slaves to England, to carry them back or sell them to others for that destination, great hardship resulted. Sharp rescued several individuals, and in 1772 he obtained the decision of the English judges in the famous case of the negro Somerset, that as soon as a slave sets his foot on English ground he becomes free. From that time he devoted himself to the destruction of slavery and the slave trade, writing and publishing many pamphlets and books. He was chairman of the meeting in 1787 which formed the "association for the abolition of negro slavery;" was one of the founders of the colony of Sierra Leone; opposed impressment of seamen, and advocated parliamentary reform.

SHARP, JAMES, Archbishop of St. Andrews, was the son of William Sharp, sheriff-clerk of Banffshire, and was born in the castle of Banff, May, 1618. Educated for the church at the university of Aberdeen, where he attained distinction as a student, and where he is said (on the authority of a tract, entitled *A True and Impartial Account of the Life of the Most Reverend Father in God, Dr. James Sharp, Archbishop of St. Andrews*, published in 1719) to have protested against the "Solemn League and Covenant;" he afterward visited England, and became acquainted with several eminent English divines, such as Hammond, Sanderson, and Taylor. Returning to Scotland, he was appointed a professor of philosophy at St. Andrews, through the influence of the earl of Rothes, and soon after minister of the parish of Crail, an office which he held during the ascendancy of Cromwell. In Aug., 1651, when Monk was reducing Scotland to obedience, he was carried off, along with several other ministers, to England. Sharp quickly regained his liberty, and he possessed, for some years, the confidence of the more moderate party in the church. In 1656 he was chosen by them to plead their cause in London before the protector against the rev. James Guthrie, a leader of the extreme section (the protestors or remonstrators), which he did with so much dexterity that Cromwell is reported to have said: "That gentleman, after the Scotch way, ought to be termed Sharp of that ilk." When the restoration was on the eve of happening, Sharp was appointed by the moderate party to act as its representative in the negotiations opened up with Monk and the king. This is the crucial period of his career, and on the view we take of his motives depends our whole estimate of his character. Was he sincere, or did he mean to betray the church to which he owed allegiance? Presbyterian writers are nearly unanimous in affirming his perfidy, although the evidence is doubtful. Among the first things the Scottish parliament that met Jan. 1, 1661, did, was to repeal or rescind every act passed since 1638, in consequence of which Episcopacy remained the church of Scotland, as "settled by law"—a dishonorable evasion of a promise made by Charles in a letter written to the presbytery of Edinburgh in Aug., 1660. Soon after, at a council held in Whitehall, Sharp was nominated archbishop of St. Andrews, and having gone up to London, he was there formally con-

secrated by the bishop of London and three other prelates. His government of the Scottish church was tyrannical and oppressive; and in consequence he became an object of hatred to most of his countrymen. When one Mitchell, a conventicle preacher, fired a pistol at him in the streets of Edinburgh, the populace allowed the intending assassin to walk quietly off, without making a single effort to arrest him. Finally Sharp was assassinated on Magnus moor, near St. Andrews, May 3, 1679, by a band of fanatical covenanters. In defense of Sharp, the utmost that can be said is that he was simply an ambitious ecclesiastic (of plausible and courtly manners), who had no belief in the "divine right" of presbytery, and who thought that if England were resolved to remain Episcopalian, it would be very much better if Scotland were to adopt the same form of church government, and that if there must be an archbishop of St. Andrews, there was no reason why he should not be the person. This theory is certainly a more sober one than the usual melodramatic covenanting view, which makes him out to be "a conscious villain," who persecuted his old friends the more fiercely that he knew they were in the *right* and he in the *wrong*.

SHARP, JOHN, D.D., 1644-1713; b. England; graduated at Cambridge in 1660; ordained in 1667; became domestic-chaplain to sir Heneage Fuch, attorney-general; archdeacon of Berkshire, 1672; prebendary in the cathedral church of Norwich, 1675; rector of St. Bartholomew, London, 1676; dean of Norwich, 1681; chaplain to Charles II., and court-chaplain at the coronation of James II. in 1688; was suspended by the king for preaching in 1686 against the claim of the Roman Catholic church to be called "the only visible Catholic church;" dean of Canterbury, 1689, and bishop of York, 1691. In 1702 he preached at the coronation of queen Anne, and was made lord-almoner to her majesty. His sermons were published in 7 volumes after his death.

SHARPE, a co. in n.e. Arkansas, having the state line of Missouri for its extreme n. boundary; 500 sq.m.; pop. '80, 9,047-9,023 of American birth, 176 colored. It is drained by Spring river, and Strawberry creek, tributaries of the Black river. Its surface is hilly, largely covered with timber, and the soil produces cotton, corn, and oats. Live stock is raised. Iron, lead, and zinc are found in the high ridges of hills which cross it. Co. seat, Evening Shades.

SHARPS, CHRISTIAN, 1811-74; b. N. J.; became a scientific machinist, and was the inventor of the Sharps rifle for military and sporting uses, and of other improvements in fire-arms. The manufacture of the rifle was begun at Hartford in 1854.

SHARP SHOOTERS, an old term applied in the army to riflemen. It is now appropriated to naval use, to the men stationed in the top to annoy those on the deck of an enemy's vessel.

SHASTA, a co. in n. California, having the Shasta mountains of the Coast range for its w. boundary; drained by the headwaters of the Sacramento and Pitt rivers; 4,200 sq. m.; pop. '80, 9,492-7,238 of American birth, 2,426 colored. It is intersected by the Oregon division of the Central Pacific railroad. In the s.e. are Lassen's peak, altitude 10,577 ft. above the level of the sea; Magee's peak, and Crater mountain belonging to the Sierra Nevada range. The climate in the valleys is pleasant. The hills are covered with fir, pine, and redwood, and cottonwood trees grow by the rivers. The soil of the bottom lands is fertile, yielding large crops of barley, wheat, fruit, and dairy products. The vine is largely cultivated, and in one year 19,287 gallons of wine were made. Gold, silver, and copper are mined, and there are underlying strata of granite and limestone. It contains hot springs, and has flour, saw, and quartz mills. Co. seat, Shasta.

SHASTRA, or SHĀSTER, but more correctly written Sâstra (from the Sanskrit *sâs*, to teach), means literally a book; but the term is especially applied to the *authoritative*, religious, and legal, books of the Hindus. See SANSKRIT LITERATURE.

SHAT EL ARAB. See EUPHRATES.

SHATTUCK, GEORGE CHEYNE, LL.D., 1783-1854; b. Mass., graduated at Dartmouth college, 1803; became an eminent physician of Boston, president of the Massachusetts medical society, and author of several professional works; built an observatory for Dartmouth college, and contributed liberally to its library; aided largely in the establishment of the Shattuck collegiate boarding-school at Faribault, Minn., under the direction of the Protestant Episcopal church; and at his death left \$60,000 to charitable objects.

SHAVE GRASS. See Equisetum.

SHAW, HENRY W., b. Mass., 1818. When fifteen years old he went to the west and there engaged in farming and as an auctioneer. In 1858 he settled at Poughkeepsie, N. Y., where he has since lived. Under the *nom de plume* of "Josh Billings" he has printed many popular comic sketches, and collections of proverbs embodying much practical wisdom in quaint speech. He has also had some success as a comic lecturer.

SHAW, LEMUEL, LL.D., 1781-1861; b. Mass.; educated at Harvard, and admitted to the bar. He was a member of the state legislature, 1811-16, and again in 1819; of the state constitutional convention in 1820, and of the state senate, 1821-22, 1828, and 1829. He was chief-justice of Massachusetts, 1830-60. He is usually considered the ablest judge that ever sat in a New England court; and his decisions (particularly in the

department of real property) have had much effect on the growth of the law, and are still quoted as authority.

SHAW, ROBERT GOULD, 1776-1853; b. Maine; engaged in business in Boston, and acquired a large fortune. He bequeathed \$10,000 to be accumulated as the "Shaw fund" till it amounts to \$400,000, when, it is to be applied to the endowment of an institution for mariners' children.

SHAW, ROBERT GOULD, 1837-63; b. Boston; grandson of Robert Gould, the philanthropist; graduate of Harvard university, 1860. In the war of the rebellion he enlisted as a private in the New York 7th regiment April, 1861; transferred in May to the Massachusetts 2d., with the rank of 2d lieutenant; capt. Aug. 10; col. 54th Mass., 1863; commander of the first colored regiment from the north; killed at fort Wagner while gallantly leading his colored troops in the assault.

SHAW, SAMUEL, 1754-94; b. Boston; in early life a clerk, but at the beginning of the revolution became a lieutenant of artillery and served with great credit at Yorktown and elsewhere. After the peace he made a voyage to China, returned and was made first-secretary of the war department. In 1786 he was made consul at Canton. His journal with a memoir by Josiah Quincy was printed, 1847.

SHAW, THOMAS, D.D., 1692-1751; b. England; educated at Queen's college, Oxford. After acting for several years as chaplain to the English factory at Algiers he traveled in northern Africa, Palestine, and Asia Minor, returning to England in 1734. In 1740 he became principal of St. Edmund's hall, Oxford, regius professor of Greek, and vicar of Bramley, Hampshire.

SHAWANO, a co. in n.e. Wisconsin; drained by Wolf, Oconto, Red, and Embarras rivers; about 1500 sq.m.; pop. '80, 10,371-6,354 of American birth. The surface is mostly woodland. The principal productions are wheat, oats, and lumber. Co. seat, Shawano.

SHAWL-MANUFACTURE. Perhaps no garment is of higher antiquity than the shawl; indeed, its simplicity of form would lead us to infer that it was the earliest in use. But of its manufacture we have no distinct account until the reign of the emperor Jelal-ed-din-Mohammed Akbar, in 1556, when the celebrated Cashmere shawls were among the most important manufactures of the world, and were thought worthy to be minutely described in the *Ayin-i-Akbari*, or the "institutes of the emperor." In that work four distinct classes of shawls, all of goat's wool, are described. The first were of remarkable lightness and softness, and were usually self-colored, and made of the wool undyed; the second were woven of wool in the natural colors—viz., white, black, and gray—these were probably arranged so as to form a plaid pattern similar to the shepherd's plaid of Scotland, which is of oriental origin; the third were called *gold-leaved*, probably from being embroidered with that material; and the fourth were long shawl-pieces large enough to inwrap the whole body. So carefully was this manufacture fostered that it received the chief attention of the emperor, and every shawl manufactured was carefully described and registered, and the number of manufacturers was so great that in Lahore alone it is stated there were upward of 1000. The manufacture, in later times, passed through many vicissitudes, and during last century it declined greatly; but in 1809 it had again risen, and there were then about 16,000 looms at work. From 2,000 to 3,000 of these beautiful fabrics are annually imported into Great Britain; but the admirable imitations now produced by our Paisley manufacturers, and by the French, are exerting great influence over the trade. The true Cashmere shawls are woven in many pieces, and joined together with great artistic skill; those of Britain and France are, however, woven in one piece, the loom being worked by hand, and of course furnished with a Jacquard machine for the production of the pattern. Besides the Cashmere shawls and their European imitations there is an infinite variety of shawls made of various materials—as silk plain, embroidered, and in the form of crape; thread, cotton, and silk lace; and wool in a great variety of styles.

SHAWNEE', a co. in n.e. Kansas, traversed by the Kansas river; 600 sq.m.; pop. '80, 29,092-26,124 of American birth, 5,441 colored. It is drained by the Wakarusa river, and Soldier and Cross creeks. It is intersected by the Kansas Pacific, and the Atchison, Topeka and Santa Fé railroad. Its surface is nearly level, the streams flowing through prairies of great fertility, producing corn, oats, potatoes, and dairy products. Its mineral products are bituminous coal, and limestone. It has book-binderies, and manufactures of carriages, and wagons, furniture, machinery, metallic-wares, etc. Co. seat, Topeka.

SHAWNEES. The name of a tribe belonging to the Algonquin family, which extended about the middle of the 17th c. from lake Erie s. as far as Florida, and a portion of which was in Pennsylvania at the time of the Penn settlement. In Carolina they were known as the Savannahs, or Semassees. Early in the 18th c. they allied themselves with the French, though formerly friendly with the English, and assisted them in the war with the latter. In 1758, however, they renewed their friendship with the English, and were engaged in opposition to the Virginians in 1774, who, however, defeated them. After the peace of 1786, being still influenced by the English, they took

part in the Miami war, fought Harmar and St. Clair, and were finally reduced by gen. Wayne, and made peace in 1795. They were now located on the Scioto, though a portion of them were in Missouri on lands obtained from the Spaniards. During the war of 1812 some of them were again won over by the English, and joined with Tecumseh in endeavoring to bring about a general Indian uprising against the Americans. The number of the Shawnees is about 800, on agencies in Indian territory.

SHAYS'S REBELLION, under the leadership of Daniel Shays, in w. Massachusetts in 1786-87, involving nearly 2,000 men on the side of the insurgents. The outbreak was occasioned by general popular dissatisfaction at the pressure of taxation, the burdensome salaries of state officials, and the scarcity of money at the close of the revolutionary war. A paper currency issue was demanded, riotous action took place in several counties, and Shays himself, with a considerable body of followers, endeavored to gain possession of the arsenal at Springfield, but was driven off by the militia and a force under command of gen. Lincoln. Of 150 who were captured, 14 were tried and sentenced to death, but afterward pardoned. Shays was also pardoned, after being hidden away for a considerable period, and retired to Sparta, N. Y., where he died in 1825. He was born in Massachusetts in 1747, was a sergeant at Bunker Hill, and rose to be capt. during the revolution.

SHEA. See **BASSIA**.

SHEA, JOHN D. GILMARY, LL.D., b. New York, 1824; educated at the grammar-school of Columbia college, and admitted to the bar, but gave himself chiefly to historical subjects. He has written numerous works, mainly on American history; the most important of which are *The Discovery and Exploration of the Mississippi Valley*; *History of the Catholic Missions among the Indian Tribes of the United States*; *The Fallen Brave*; *Early Voyages up and down the Mississippi*; *The Operations of the French Fleet under Count de Grasse*; *Washington's Private Diary*; translation of Charlevoix's *History of New France*. He has published Roman Catholic prayer-books and school histories, prepared the *Catholic Almanac*, edited the *Historical Magazine*, and written much for the publications of historical societies. In his department of history he holds high rank for accuracy and research.

SHEAFER, PETER WENRICK, b. Penn., 1819; son of Henry Sheaffer; pursued his early studies at Oxford academy, N. Y. His father introduced the Lykens Valley coal into the market in 1834, and employed him in his mining operations until in 1838 he participated in the first geological survey of Pennsylvania, led by prof. H. D. Rogers, being especially useful in the vicinity of the Second mountain. In 1848 he took up his residence in Pottsville. He managed the Philadelphia and Reading coal and iron company, and the Girard mines of the city of Philadelphia. He has visited the British provinces and the Deep River coal lands of North Carolina, has given lectures at Lafayette college and other institutions. He was the originator of the first state survey of Pennsylvania in 1849, and the succeeding one in 1873 owed its organization to him.

SHEAFFE, SIR ROGER HALE, 1763-1851; b. Boston; entered the British army in 1778. He served through the war of 1812, commanding the British at the battle of Queenstown after the death of gen. Brock, and conducting the defense of York (now Toronto). He was made gen. in 1828.

SHEARING-MACHINE, a machine used in the preparation of woven woolen fabrics. See **WOOLEN MANUFACTURES**.

SHEARS of various kinds are among the implements used in gardening. They are scissors on a large scale, variously modified to suit their various purposes, such as pruning trees, hedges, box-edges, the verges of grass plots, etc. They are often furnished with long wooden handles, and a spring is sometimes fixed between the handles. A kind used for removing small branches of fruit-trees has one blade made to slide along the other while they are brought together, so that it makes a cut as clean and smooth as that of a knife.

SHEAR-STEEL. See **IRON**.

SHEARWATER, *Puffinus*, a genus of *procellariæ* (see **PETREL**), differing from petrels in having the tip of the lower mandible curved downward, and the nostrils opening separately and not by a common tube. The bill is as long as the head, or longer, the upper mandible compressed and curved at the point. The legs are of moderate length, the tarsi compressed, the hind-toe rudimentary. The wings are long and pointed. The shearwaters spend their lives mostly on the ocean, rarely visiting the shore except for the purpose of incubation.—The **GREATER, WANDERING, or CINEREOUS SHEARWATER** (*P. cinereus* or *major*) is about 18 inches long, the upper parts blackish brown; the throat, breast, and belly gray. Young birds are entirely brown, the upper parts darkest. This species is frequently seen on the s.w. coasts of Britain. It is very abundant on those of Newfoundland.—The **MANX SHEARWATER** (*P. Anglorum*) is much more common on the British coasts, and is found also in more northern regions. It is about 14 inches long, grayish black, the neck mottled with gray, the throat and all the under parts white. It breeds on islets, in rabbit-burrows, or in crevices of the rocks.—There are

several other species in warmer climates.—The name shearwater is sometimes also given to the skimmers.

SHEATH-BILL, *Chionis*, a genus of birds of the family *chionidæ*, placed by many naturalists among the *grallæ*, but by others regarded as belonging to the *gallinaceous* order, and ranked by Mr. Swainson among *colymboidæ*. The legs are stout and moderately long, the toes much resemble those of the common fowl, but the fore-toes are united at the base. The bill is thick and conical, and the base is covered by a horny sheath, which the bird has the power of raising and depressing. The **WHITE SHEATH-BILL** (*C. alba*) inhabits the shores of Australia, New Zealand, and neighboring islands, and feeds on mollusks, crustaceans, and whatever animal substance is thrown up by the waves. It is about the size of a partridge.

SHEATHING is a protection for the wooden planking of the immersed portion of a ship from the attacks of the teredo and other worms, mollusks, and marine animals, which, especially in hot climates, adhere to the bottom and eat into the timber, while they retard the vessel's progress. As early as the time of Trajan sheets of lead were used as sheathing. Thin deal boards, about half an inch thick, were in more modern times nailed on and frequently changed; but about the commencement of the present century plates of copper were introduced, which have been found most effectual, though expensive. The gradual oxidation of the copper by the action of the sea-water produces a sort of poison, which prevents any marine animal from adhering, and keeps a clean bottom. The copper, however, slowly wears away in this oxidation, and requires renewing after a few years. To prevent this loss various methods have been devised. Sir H. Davy applied what he called protectors, consisting of pieces of iron and zinc on different parts of the *copper*; the action of the water on the two metals produced a small galvanic current, which prevented the copper from oxidizing; but it became forthwith encased in barnacles and weeds. For ships stationary in harbor, as hulks, ships-in-ordinary, &c., this system of protection answers well; but it fails for sea-going vessels, together with many other protecting mixtures which have been tried, from the fact that in proportion as the copper is saved from oxidation, by so much does it cease to repel the incrustations which always threaten it.

SHEAVE. See **PULLEY**.

SHEBA. See **SABEANS**.

SHEBOYGAN, a co. in e. Wisconsin, on the w. shore of lake Michigan; drained by the Onion, Mullet, and Sheboygan rivers; traversed by the Wisconsin Central, the Milwaukee, Lake Shore and Western, and the Sheboygan and Fond du Lac railroads; about 500 sq. m.; pop. '80, 34,206—23,274 of American birth. The surface is about one-third woodland, and the rest fertile prairie; wheat, oats, hay, wool, and dairy products are the staples. Co. seat, Sheboygan.

SHEBOYGAN, a t. and port of Wisconsin, on the w. bank of lake Michigan, at the mouth of the Sheboygan river, 52 m. n. of Milwaukee. It was settled in 1836, has a good harbor, with mills at Sheboygan falls, 6 m. above, and a large trade in wheat and timber. Pop. '70, 5,310; '75, 6,828.

SHECH'EM, a city in central Palestine on mount Ephraim, about 25 m. n. of Jerusalem. It was one of the cities of refuge, and the first capital of the kingdom of Israel. It is called Sychar in the New Testament. After being destroyed in the war with the Romans it was rebuilt in the reign of Vespasian and called Neapolis. On coins still found it is called Flavia Neapolis. Its present name is Nablûs. Its situation is exceedingly beautiful. Present population 5,000, mostly Mohammedans.

SHECHINAH (from *shechin*, to reside, rest), a word used in post-biblical times by the Jews, and adopted by early Christian writers; expressive of the presence of the divine majesty in heaven, among the people of Israel, or in the sanctuary. It is first found used in the Chaldee versions (Targums) as a kind of periphrasis for the person of God, wherever it is mentioned in the Bible as corporeal; thus being a kind of spiritual interpretation of anthropomorphism. The shechinah is not supposed to have dwelt in the second temple, but it is to return with the Messiah. The particular place where the shechinah was supposed to dwell was the "mercy-seat between the cherubim." The cherubim or other angels were always more or less connected with the shechinah itself, as in the phrases "the heavenly hosts," "hosts of saints," &c., accompanying the divine presence. The first mention of the word is found in the Targum Jerushalmi, Gen. iii. 24—"And He expelled Adam, and caused to reside the splendor of his shechinah from the beginning at the e. of the garden of Eden, above the two cherubim." (Second recension: "between the two cherubim.") Another characteristic instance of its use is found in the version of Onkelos, Deut. iii. 24—"Thou art God, thy divine shechinah is in heaven above, and rules on earth below."

SHEDD, WILLIAM GREENOUGH THAYER, D.D., LL.D., b. Mass., 1820; graduated at the university of Vermont, 1839, and at Andover seminary, 1843; pastor of a Congregational church at Brandon, Vt., 1844-45; professor of English literature in the university of Vermont, 1845-52; of sacred rhetoric and pastoral theology, Auburn seminary (Presbyterian), 1852-53; and of ecclesiastical history, Andover theological seminary, 1853-62;

pastor of the Brick Presbyterian church, New York, 1862-63; professor of biblical literature, Union seminary (Presbyterian), New York, 1863-74, and now professor of theology there. Among other works he has published *System of Rhetoric; Philosophy of History; Discourses and Essays; History of Christian Doctrine; and Homiletics and Pastoral Theology*. His history of doctrine has been highly appreciated. As a theologian he is regarded as developing the sterner elements more fully than is common in recent years.

SHEE. Sir MARTIN ARCHER, D.C.L., 1770-1850; b. Dublin. He studied art under R. West in Dublin, and in London under sir Joshua Reynolds, to whom he was introduced by Edmund Burke. In 1798 he was made an associate of the Royal art academy. He became president of the academy in 1830, and in the same year was knighted. He was a portrait painter of great popularity, though inferior in genius to Lawrence. He published, in 1805, *Rhymas on Art*, a poem praised in Byron's *English Bards and Scotch Reviewers*. His tragedy *Alasco*, 1824, refused a license as treasonable, was printed, but has little or no merit.

SHEEP, *Ovis*, a genus of ruminant quadrupeds of the family *capridæ*, so nearly allied to goats that the propriety of generic distinction is very doubtful. They differ from goats in having the outline of the face more or less arched and convex; the horns spiral, sometimes very large in the males—in domestication, however, often wanting in the females, and also in the males of some breeds; the chin destitute of a beard; a sac or pit between the toes of each foot, lined with hair, and secreting a fatty matter. It is supposed by some that all the wild sheep existing in different parts of the world are mere varieties of one species, but of this there is no sufficient proof, nor is there anything more than unsupported conjecture in any of the opinions advanced concerning the origin of the domestic sheep, such, for example, as that which refers it to the moufflon (q.v.), or that which ascribes different domesticated breeds to different wild originals, as the moufflon and the argali (q.v.).

All the wild sheep known are natives either of mountainous regions or of dry and elevated table-lands. They are gregarious, a character which the domesticated sheep fully retains. They are generally seen in small flocks, and are not easily approached, taking refuge in flight, a sharp whistling sound, emitted by one of the rams, serving as an alarm to the whole flock; although they are very capable of making a vigorous defense when driven to close combat. A ram of the domestic species is, indeed, able to sustain a conflict with a bull, taking advantage of his far greater agility and butting against his foe with his strongly armed forehead. A ram has been known to throw a bull on the ground at the first onset, and is always ready to defend himself and his companions against a dog. Many rams exhibit great pugnacity. Sheep differ from goats in their mode of fighting. Goats rear themselves on their hind-legs, and throw themselves sideways on their adversary, to bring the points of their horns to bear. Sheep rush straight at each other, a mode which better suits the different style of armature of the head. Rams of the black-faced variety are especially powerful with their heads, and often at the rutting season kill each other. Their naturally strong skull is considerably protected in battle by heavy arched horns. A thorough ram fight is a terrifying sight. The two warriors go backward each some 15 or 20 yards, and then meet each other with great violence, their heads cracking loudly, and their beam-ends rising in response to the collision of heads. Ewes of this breed fight also. Sheep without horns are not so pugnacious as the mountain breeds.

All the wild sheep have short wool, with an outer clothing of long and nearly straight hair. But even the long hair—at least on the moufflon—has the peculiar character of wool, in that roughness of surface which gives it the property of *felting* (see HAIR and FELT). One effect of domestication in the common sheep has been to cause the disappearance of the outer long hair, and to produce instead an increase of the length and abundance of the wool, an object of great importance to the sheep-farmer. In neglected breeds of the common sheep the two kinds of hair or wool are very apparent. In some tropical climates the sheep loses its abundant fleece, and is covered with hair little longer than that of the ox.

Although not equal to goats in their adaptation to rocky steeps, and not endowed with such power of leaping from crag to crag, most breeds of sheep exhibit a strong disposition to seek their food in places where no animal not very agile and sure-footed could venture; and those of the domesticated breeds which retain much of their original wildness are thus adapted to situations in which otherwise the pasture would be of little value to man. Every one who has seen the lambs frisking on a Highland hill, in a fine evening, must have admired their nimble movements in places where a herd-boy could with difficulty scramble. In fine weather sheep ascend the heights; and in cold and stormy weather they repair to the lower grounds. In modern times it has been customary to remove the large flocks from mountainous regions to lower grounds to pass the winter; and in the fall of the year shepherds have difficulty in preventing the animals from leaving the summer pastures too early if the weather is unfavorable. On the other hand, if fine spring weather sets in before the period of removal from the winter quarters, the flocks keep pressing toward the summering regions. Mountain sheep have favored spots whither they go regularly over night, and the ewes generally have choice localities to which they go to lamb. They get much attached to certain pastures, and

many of them have been known to return stealthily, in the course of a few days, to their native or appreciated pastures, though removed some hundreds of miles.

A very interesting species of the wild sheep is the **ROCKY MOUNTAIN SHEEP**, or **BIGHORN** (*O. montana*), of North America. It is equal in size to the argali, which it much resembles also in its general appearance, and in the size and curvature of its horns. The horns of the old rams attain so great a size, and are so much curved downward and forward, that they often effectually prevent the animal from feeding on level ground. The abode of this species is in the most craggy and inaccessible parts of the Rocky mountains. The flesh is of the very finest quality. The wool is very fine, and fully an inch and a half long; it is completely concealed by long hairs. The general color is brown, paler on the lower parts; the old rams are almost white in spring. The **Aoudad** (*O. tragelaphus*) is a native of the n. of Africa, inhabiting chiefly the lofty parts of the Atlas mountains. It is sometimes called the bearded argali, although it has no beard on the chin; but the throat, the chest, and the front of the forelegs are remarkably adorned with long shaggy hair. On other parts the hair is comparatively short, with an underclothing of short wool. The color is a uniform reddish-yellow. The tail is longer than in the other wild species, and is terminated by a kind of tuft of long hairs. The horns are not so large as in the other wild species. In size, the aoudad exceeds the moufflon, but is not equal to the argali. The French call it *moufflon a mouchettes*, or ruffled moufflon, from the long hair of its forelegs.

The **COMMON SHEEP** (*O. aries*) was probably the first animal domesticated by man. We are told in the book of Genesis that Abel was "a keeper of sheep," and that he brought an offering unto the Lord "of the firstlings of his flock and of the fat thereof." And from that time until the death of Christ, lambs continued to be the most frequent sacrificial offerings, both among the patriarchs and the Jews. The felting and weaving of wool were unquestionably among the earliest of the arts. The wool was probably at first pulled from the skin, a rude and even cruel practice, which it is said still subsists in some countries, and was not very long ago relinquished in the Orkney islands. We read in Genesis xxxviii. of Judah shearing his sheep, and there is abundance of other evidence that the better mode of obtaining the fleece has been in use from remote antiquity. The leather made of the skin of the sheep is much employed in bookbinding, and for making gloves. In patriarchal times, the milk was much used, as it still is in some countries; it is richer than cow's milk, and the cheese made of it has a sharp taste and strong flavor, which, however, are greatly relished by some. In Britain the milk is now very little used. In some mountainous parts of India the sheep is even used as a beast of burden, carrying loads of from 35 to 40 pounds, over rough tracks, and up steep crags, where almost no other animal could be employed.

Those who watch sheep carefully, or keep them as pets, find them by no means devoid of intelligence. They have, however, a stupid habit of following, without scruple, the leader of the flock; so that, when sheep are being driven across a narrow bridge, or where a fence separates the road from a precipice, if anything occur to deter them from proceeding in the proper path, and one break over the fence or parapet, more of the flock may be expected to follow, as has sometimes happened, to their utter destruction. Sheep very soon come to know the voice of the shepherd, and also the appearance as well as the bark of the shepherd's dog. Though they stand more in awe of the shepherd's voice or commands than of any other human being's, the dogs regularly moving among them fail to keep them in such subjection as strange ones do.

The "rutting" is from September till the middle of December, according to the variety of sheep and the system of feeding. White-faced modern breeds have the tups early among them, and the hill flocks are later. The period of gestation is from 20 to 21 weeks. Ewes occupying sown or low-ground pastures lamb in March, while those not so well provided for—the mountain sheep—do not drop their lambs usually till April. The ancient breeds generally have only one lamb in a season, but modern highly fed varieties frequently have twins, occasionally triplets, but rarely more. Lambs intended to come early into the market are as often as possible dropped in January. Generally lambs are weaned in July and August. Weaning of breeding or store lambs, however, is a feature of modern sheep-farming; at one time it was not uncommon to see several generations persistently following the parent stem. The shearing season ranges from May 1 till the middle of July, according to the description of sheep, the nature of the feeding, etc. Autumn is the most common time for the "dipping," "juicing," or "smearing" of the flocks, to kill vermin, prevent skin disease, and preserve and cultivate the wool crop.

The great object for which the ancient Britons possessed sheep before the Roman invasion was the production of wool. The demand for butcher-meat has now raised the value of mutton and lamb so much that the farmer finds it profitable to devote much of his attention to supply the market with these articles; and those breeds of sheep are reckoned most valuable which are most suitable for this purpose, even although the quality of the wool is inferior. When there was no food for sheep but the natural pasture, the animals could not be fattened for the market except during summer, and not until they had attained an age of three, four, or five years; whereas much of the mutton now consumed is the flesh of sheep not more than two years old, fattening being aided by turnips, mangold, oil-cake, etc.

The young branches of heath, and in lower situations, the shoots of furze, often serve as food for sheep, when the supply of grass fails. Sheep delight in short grass and peculiar herbage of hill pastures and bare downs; and the mutton produced in such pastures, and by the breeds most suitable to them, is of superior quality to that of the large fat sheep fed on richer soils. The latter are also more liable to many diseases, particularly where the ground is at all moist. Aromatic and bitter herbs are particularly relished by sheep.

The breeds of sheep are very numerous, and very different.—The **BLACK-FACED SHEEP** of the Highlands of Scotland and of the north of England is perhaps as near the original type as any existing breed. Both male and female have horns; those of the ram large, with two or more spiral twists, those of the ewe much smaller, and little twisted. The face and legs are not always black. Many are speckled, and some principally white. The black-faced sheep is robust, very active, and hardy; enduring the rigors of a severe winter when sheep of most of the breeds common in Britain would perish. It survives on little food, and shifts admirably for itself in a snow-storm. The small quantity, and even inferior quality, of food with which a black-faced sheep will tide over a snow-storm is most surprising. As an instance of the tenacity of life in black-faced sheep, under certain circumstances, they have been known to be buried five weeks under a snow-wreath and come out alive. It has a bright, quick eye, with an expression very different from that softness which is seen in many of the breeds preferred for lower grounds and better pastures. The wool is long and coarse, and the weight of the fleece from 3 to 4 pounds; but the mutton is of the finest quality; and on this account, and its hardness, this breed is preferred to any other in many mountainous districts and on rough elevated moors.—The **WELSH SHEEP** is much smaller than the black-faced; both sexes horned; the color various; the mutton highly esteemed; the fleece seldom weighs 2 pounds.—A very little larger breed with big bushy tail, hornless, or with short and little twisted horns, has long existed in the Shetland and Orkney islands; its wool affording the material for the manufacture of Shetland hose. The Shetland and Orkney sheep are very hardy, and in winter feed much on seaweed.—Smaller than either of these, and, indeed, remarkably diminutive, is the hornless **BRETON SHEEP**—The **FOREST SHEEP** of England, so called from being pastured in the royal forests, has now in most places been supplanted by other breeds. They are still to be seen on the barren grounds between the British and Bristol channels; and the mutton is in much request in the London market. The original forest sheep was generally small, with face and legs russet brown or gray, wild, restless, and difficult to fatten, but producing wool of fine quality.—The **DORSET SHEEP** is one of the best of the old English upland breeds. Both sexes have small horns. The wool and mutton are of medium quality; but the ewes are remarkable for their fecundity, and the abundance of their milk; and this breed is valued as affording a supply of early lamb for the London market.—The **RYELAND SHEEP** has long existed in Herefordshire and some neighboring counties of England. It is small, short-limbed, white, hornless; produces excellent mutton; and before the introduction of merino wool, its wool was preferred to every other kind for the manufacture of the finest broadcloths.—The **CHEVIOT SHEEP** has existed from time immemorial on the Cheviot hills, and is now very widely diffused over a considerable part of England and almost all parts of Scotland, being hardy and well adapted for high grounds, although it is inferior in hardness to the black-faced. Cheviots, however, rather excel the black-faced both in size and in the value of the fleece; but require a richer pasture. Ewes are hornless, and the rams almost so. The general figure is longer than that of the black-faced sheep. They are narrow in shape, with slender forequarters and long pricked ears. The color is white, the face and legs occasionally mottled with gray, but generally quite white. The fleece weighs from 3 to 5 pounds. Great attention has for many years been devoted to the improvement of this breed.—The **LEICESTER SHEEP** is another of the most valuable breeds. This breed, as it now exists, is a result of the skill and care of Mr. Bakewell, who, soon after the middle of last century, began to make experiments for the improvement of the old Leicester sheep—a large, coarse-boned sheep, not easily fattened, and with coarse long wool, of which, however, the fleece weighed from 8 to 10 pounds. The new Leicester sheep has wool moderately long, of better quality, the average weight of the fleece being about 7 or 8 pounds, and is easily rendered very fat. It is naturally very broad on the back, with finely arched ribs. The color is white. Both sexes are hornless. The Leicester sheep is now common in all but the mountainous parts of Britain, and other breeds have been improved by crossing with it, particularly various breeds of long-wooled sheep, which have long existed in different parts of England, as those of Lincolnshire, Romney Marsh, &c.—A famous long-wooled breed is that called the **COTSWOLD or GLOUCESTER**, the wool of which was in great esteem in the 14th and 15th centuries, bearing a higher price than any other wool. In 1464 Edward IV. sent a present of Cotswold rams to Henry of Castile; and in 1468 a similar present was sent to John of Aragon. The Cotswold breed, however, as it at present exists, has been modified by crossing with the Leicester, and produces shorter wool and better mutton than in former times.—The **SOUTH DOWN SHEEP** has recently been improved with the utmost care. The color is generally white, and the face and legs are generally dun, black, or speckled. Both sexes are hornless. The wool is short, very close, and curled. The south down derives its

origin and name from the chalky *downs* of the south of England; but is now met with throughout England and the south of Scotland. The Shropshire sheep are large, with thick wool something like the south down. They are hornless, and black or dun in the face and legs. They come early to maturity, but are suited only for finer climates and good keep. The Oxford down is a heavy, somewhat soft sheep, without horns, and capable of rapid and great development under good treatment. It is not suited to very cold and exposed situations.

The ICELAND SHEEP is remarkable for very frequently having three, four, or five horns. They are good butchers' animals, being deep and thick in the carcass, though rather short in the quarter. The same peculiarity, or monstrosity, as it may be deemed, is exhibited by the sheep of some of the most northern parts of Russia. The n. of Africa possesses a breed of sheep with legs of great length, pendulous ears, and much arched face; the wool short and curled, except on the neck and shoulders, which have a kind of mane. India has also a hornless breed, with pendulous ears, short tail, and very fine much-curled wool. The BROAD-TAILED or FAT-TAILED SHEEP is found in many parts of Asia, as in Syria, India, and China, also in Barbary, and is now very abundant in the colony of the cape of Good Hope. It is rather of small size, with soft and short wool. Its chief characteristic is the enormous development of the tail, by the accumulation of a mass of fat on each side, so great that the tail has been known to weigh 70 or 80 lbs. The tail is highly esteemed as a delicacy, and to protect it from being injured by dragging on the ground, the shepherd sometimes attaches a board to it, or even a small carriage with wheels. The fat of the tail is often used instead of butter. It is less solid than other fat. The FAT-RUMPED SHEEP of southern Tartary has a similar accumulation of fat on the rump, falling down in two great masses behind, and often entirely concealing the short tail. The ASTRAKHAN or BUCHARIAN SHEEP has the wool twisted in spiral curls, and of very fine quality. The Circassian sheep has a remarkably long tail, covered with fine long wool, which trails on the ground. The WALLACHIAN SHEEP, common in Hungary, as well as in the country from which it derives its name, is distinguished by the magnitude of its horns, and their direction. They make one great spiral turn, and then generally rise up from the head to a great height, twisting round as they rise. The wool is soft, and is concealed by long hair.

SHEEP (*ante*) were introduced into the American colony of Jamestown, Va., in 1609, and into New York and Massachusetts about 1625. Within 40 years the number in the colonies had increased to 3,000. The breeds generally esteemed the best in the United States are the Vermont Brewer and Atwood flocks; though the French, Saxon, and Spanish merinos are favorites with some. The Leicester breed is considered the best for the farmer, being heavy in carcass and full in yield of wool. Southdowns are preferred for their mutton, and the Cotswold is highly considered. The total number of sheep in the United States in 1880 was 40,765,900, valued at \$80,230,537, the average price being \$2.21. The largest number in any one state was 7,646,800, in California; the smallest number, in Rhode Island, 28,200. There were 5,148,000 in Texas; 2,205,800 in New York; 4,080,000 in Ohio. The highest average price was \$4.01, in New Jersey; the lowest, \$1.44, in Georgia.

SHEEP-LOUSE, or **SHEEP-TICK**, or (in Scotland) **KAIT**, *Metophagus ovinus*, an insect of the family *hippoboscidae*, to which also the forest-fly belongs, ranked in the order *diptera*, although in this genus the wings are completely wanting. It lives among the wool of sheep, and particularly of lambs, sucking the blood of the animal, and is most abundant in the early part of summer. Where it fixes its head in the skin a large round tumor is formed. Its body is very compressed and smooth, of a rusty color, the head and thorax small, the abdomen large. The female does not lay eggs, but, like the other *hippoboscidae*, hatches the egg and nourishes the larva within her own body, till it passes into the pupa state, when it is deposited, oval-shaped and shining, fastened to the wool of the sheep. Sheep-farmers use various washes or *dips* for the destruction of these creatures, many of which are arsenical. A patent was obtained a few years since for a sheep-dip, of which carbolic acid is a principal ingredient.

SHEEP'S-HEAD, *Sargus oris*, a fish of the family *sparidae*, plentiful in the latter part of summer on some parts of the coast of North America, and highly esteemed for the table. It sometimes attains a weight of 14 or 15 pounds. A very large fish is sometimes sold in the New York market for a price equal to four or five pounds sterling. The fishery is therefore of some importance. Nets are used, and many fish are often taken at a single haul, which are immediately packed in ice for the market. It is difficult to take the sheep's-head with a line, as its cutting teeth snap the line asunder. The genus *sargus* has cutting front teeth, and round teeth in the back of the mouth. *S. rondeletii* inhabits the Mediterranean, and has been esteemed for the table from ancient times. The *sargi* feed on shell-fish and the smaller crustaceans, which they easily crush with their round teeth; partly also on sea-weeds.

SHEEP-STEALING, in England, is felony, and is punishable with penal servitude from three to fourteen years, or imprisonment for two years. In Scotland it is a capital offense, though, for some time, it has never been punished capitally.

SHEERAZ. See **SHIRAZ**, *ante*.

SHEERNESS, a sea-port and naval arsenal in the co. of Kent, stands on the n.w. extremity of the Isle of Sheppey, at the confluence of the Thames and Medway, 11 m. e.n.e. of Chatham. It consists of four divisions, Blue-Town, Mile-Town, Marine-Town, and Westminister, and of these the first is within the limits of the garrison. The dock-yard, much extended and improved within recent years, is now one of the finest in Europe. It covers 60 acres, comprising wet and dry docks, immense storehouses, and official residences. The harbor is usually crowded with vessels of all descriptions. An extensive oyster-fishery is carried on in the vicinity, from which as many as 50,000 bushels of "natives" have been sent to London in one season. At Garrison point is the residence of the port-admiral, the telegraph, coast-guard station, and barracks. The chief trade is in supplying the requirements of the employees in the various government establishments, and in the export of corn seeds and oysters. The neighborhood was once thought to be very unhealthy, but of late years important sanitary works have been carried out, and there are now few towns the population of which enjoy better health. Since the provision of direct railway communication with all parts of England the town is much visited during the summer on account of the excellent sea-bathing there, which is under the management of a local joint-stock company. The beach and cliffs are a favorite resort for rambles. Pop. '71, 13,956. Sheerness was captured by the Dutch under De Ruyter in 1657, and here the mutiny of the *Nore* burst forth in 1798.

SHEERS. The elemental form of a pair of sheers consists in two spars fastened together near the top, with a pulley at the point of junction, and held by a rope, fastened to any convenient object, in such a position that the weight lifted hangs nearly between the spars. This forms an easily improvised crane. An apparatus of this kind, of great height and strength, is used for masting vessels. In the principal dock-yards there are tall permanent sheers, mounted either on the side of a masting-dock or on a floating sheer-bulk.

SHEET, on ship-board, is the rope by which each of the lower corners of a square-sail, or the after-corner of a fore-and-aft sail, is held down in order that the sail may be tightened to the wind.

SHEETING, a cloth made of flax or cotton, and used for bed-linen. It is chiefly made in Ireland in or near Belfast, and in Scotland. The term sheeting is also applied to the coarse hempen cloth used for making tarpaulins (q.v.).

SHEFFIELD, a t. in w. Massachusetts, in Berkshire co.; pop. '80, township, 2,204. It is built in a valley 31 m. s. of Pittsfield, and 45 m. w. of Springfield. On the w. are the Taconic mountains, on the e. the Hoosac range, leaving a valley at this point 4 m. in width. Farming is the principal occupation. Berkshire soda springs and delightful scenery attract visitors, invalids, and tourists. Its mineral resources are limestone, gneiss, and white marble; the latter, of excellent quality, supplied the columns of Girard college, Philadelphia, and was used in the new court-house at New York city. Trout-fishing and wood-cock shooting attract sportsmen.

SHEFFIELD, an important manufacturing t. and parliamentary borough, in the West Riding of Yorkshire, and capital of an independent district, called Hallamshire (see *Summe*); it is picturesquely situated on several hills that slope toward the confluence of the rivers Sheaf and Don, 140 m. n.n.w. of London, with which it is connected by the Great Northern and Midland railways, and 43 m. s.s.w. of York. The town, generally, is well built. It possesses many fine public buildings, such as the original parish church, supposed to have been erected in the reign of Henry I., 240 ft. long by 130 ft. broad; St. Mary's Catholic church, surmounted by a tower 200 ft. high; the town-hall, cutlers' hall, corn exchange; the new market-hall, or Norfolk market, with a roof of glass and iron, erected by the duke of Norfolk at a cost of about £40,000; music-hall, assembly rooms, theaters, etc. There are extensive botanic gardens, and a fine cemetery about a mile from the town; many churches; numerous educational establishments, such as the free grammar school, the collegiate school, the Wesley college, a Lancasterian and many national schools, free writing-schools, school of art, besides denominational schools, etc.; also a mechanics' institution, established in 1832. The mechanics' library (1829) is now merged into the free library, which contains upward of 11,000 volumes. There are likewise many charitable institutions. As far back as the time of Chaucer, Sheffield was noted for the manufacture of cutlery; and at the present day an endless variety of articles in brass, iron, and steel is produced at the many manufactories with which the town abounds; such as knives of every description, silver and plated articles, britannia-metal goods, coach-springs, spindles, hammers, files, saws, boilers, stoves, grates, buttons, etc. In March, 1864, a new embankment, constructed for the Sheffield water-company, at Bradfield, gave way, and let out a body of water 95 ft. high from a reservoir 78 acres in extent. The destruction of life and property by this flood was unprecedented in England: 250 persons perished; mills, houses, and hamlets were swept away from their foundations, and, apart from the ruin of the Bradfield dam, damage was done to private property to the extent of close upon £300,000. In 1866 trade outrages, in the form of "rattening"—a local name for the stealing of tools and wheel-bands—and of unscrupulous treatment of the lives and limbs of non-union men, which had for more than twenty years been a disgrace to Sheffield, were brought to a prompt check by a royal commission,

procured, among other influences, by the loyal outspokenness of the local press. Two fine churches have been recently erected—All Saints, a cruciform, early second pointed edifice, in 1867; and Sharrow church, of the late first French pointed period, in 1868. Since 1871 the introduction of the manufacture of armor-plates, railway-springs, tires, and rails has given a remarkable impetus to the growth of the town. The Albert hall, erected in 1873, is a commodious building which seats 3,000 people. Sheffield has three public parks, one of which was presented to the town in 1878. Pop. '71, 239,946. The borough returns two members to parliament. Mary queen of Scots was imprisoned in Sheffield manor-house, about 2 m. from the town, for 12 or 14 years.

SHEFFIELD SCIENTIFIC SCHOOL. See **YALE COLLEGE**.

SHEFFORD, a co. in s.w. Quebec, intersected in the s. by the Stanstead, Shefford and Chambly railway; 555 sq.m.; pop. '71, 19,077. It is drained by the Yamaska river in the s.e., and the Black river in the north. It contains extensive beds of copper and iron ore. Co. seat, Waterloo.

SHEIK (Arab. elder, aged person), a title of reverence, applied chiefly to a learned man, or a reputed saint, but also used sometimes as an ordinary title of respect, like the European Mr., Herr, etc., before the name. It is, however, only given to a Moslem. The sheik Al-Islam is the chief mufti (q.v.) of Mohammedanism at Constantinople; a title supposed to have been first assumed by Mohammed II. at his conquest of Constantinople in 1453, when this place became the seat of his empire. The sheik of Mecca, by virtue of his supposed descent from the prophet, levies a kind of tribute on all the pilgrims to the Kaaba. The term is also applied to heads of Mohammedan monasteries (our abbot or prior), and to the higher order of religious preachers. Sheik Al-Gebal (ancient of the mountain) is the name of the prince of the assassins (q.v.), or those Ismaelites of Irak, who undertook to assassinate all those whom their chief would pronounce to be his enemies.

SHELL, RICHARD LALOR, 1791–1851; b. Waterford, Ireland; graduated at Trinity college, Dublin; studied law and was called to the bar in 1814. For eight years he occupied himself chiefly in writing several successful dramas, of which *The Huguenot* was the best and the least popular. In 1822 was printed the first of his *Sketches of the Irish Bar*, a keen and witty picture of the life and manners of the time, published collectively in 1855. The same year he joined the "Catholic association," and in 1825 was sent to oppose its suppression as joint advocate with Daniel O'Connell before parliament. He soon became known as a political agitator and brilliant orator; was elected to parliament in 1829; aided O'Connell in the repeal agitation, but, changing his position, took office under the Melbourne ministry, and in 1850 was sent to the Tuscan court as British ambassador.

SHEK'EL (*shekels*, from *shakal*, to weigh) originally a certain standard weight in use among the ancient Hebrews, by which the value of metals, metal vessels, and other things was fixed. Gradually it became a normal piece of money, both in gold and silver, marked in some way or other as a coin, although not stamped. The gifts to the sanctuary, the fines, the taxes, the prices of merchandise, are all reckoned in the Old Testament by the shekel, not counted but weighed. Three different kinds of gold, silver, and copper shekels are mentioned: the common shekel, the shekel of the sanctuary (probably of double value), and the shekel of royal weight. Besides these, there was a half-shekel (*bekeu*), and a fourth shekel. The sacred shekel was equal to 20 geras (beans), and 3,000 sacred shekels made a talent. The gold shekel is reckoned approximatively to contain 161 Troy grains, the silver shekel 275. During the Babylonian exile, the Persian money (*dariks*) was used by the captives; nor do they seem to have afterward used any but the coin of their foreign rulers. It was first under the Maccabæans that national money began to be struck, adorned with sacred emblems, and with inscriptions in the native language and characters. De Saulcy alone assumes, without much show of reason, Jewish coins to have existed from the time of Alexander the great. Simon, the "prince and high-priest," received, according to 1 Macc. xv. 16, the permission from Antiochus VII. to strike coin in 133 B.C. The emblems are sacred branches, sheaves, flowers, vases, etc., and the legend (in a peculiarly archaic ["Samaritan"] alphabet) contains the date, the name of the Jewish ruler, and the inscriptions "Shekel of Israel," "Jerusalem the Holy," "Redemption of Israel." The latest coins with Hebrew inscriptions date from the revolution of Bar Cochba under Hadrian. The value of the silver shekel is reckoned to be something over two shillings.

SHEKINAH. See **SHECHINAH**, *ante*.

SHELBURNE, a co. in s.w. Nova Scotia, having the Atlantic ocean for its s. and s.w. boundary; 945 sq.m.; pop. '71, 12,417. It is drained by the Clyde, the Jordan, and other rivers. The surface is level, but the shores are rocky and precipitous. It has several excellent harbors, that of Shelburne being considered the best in Nova Scotia. The principal pursuits are the fisheries and the coast trade. It contains iron works, and has a flourishing local trade.

SHELBURNE, WILLIAM PETTY, Earl of, son of the first earl, and descendant of sir W. Petty, founder of the science of political arithmetic, was b. May, 1737, and commenced his political career in 1761 by entering the house of commons as member for

Wycombe, but only sat for a few weeks, the death of his father having called him to the house of lords. When Mr. G. Grenville succeeded Bute in 1763, Shelburne, whose talents had made him remarked, although only 26, was placed at the head of the board of trade. When Chatham formed his second administration in 1766, he made Shelburne one of the secretaries of state, although not yet thirty. Upon the fall of lord North's ministry in 1782, George III. sent for Shelburne, and proposed to him to form a government. He declined, not being the head of a party, and was sent by the king to the marquis of Rockingham with an offer of the treasury, himself to be one of the secretaries of state. According to earl Russell, in his *Life of C. J. Fox*, it soon appeared that Shelburne was not so much the colleague as the rival of lord Rockingham, the chosen minister of the court, and the head of a separate party in the cabinet. Upon the death of Rockingham in 1782, the king sent at once for Shelburne, and offered him the treasury, which he accepted without consulting his colleagues. Fox thereupon resigned, and Shelburne introduced William Pitt, then only 23, into office as his chancellor of the exchequer. Shelburne's ministry, on the occasion of the king's announcement of his determination to concede the independence of the American colonies, found itself outvoted by the coalition between Fox and lord North. He resigned, and the coalition ministry took his place, but soon broke up. The nation expected that the king on this event would have sent for Shelburne, but William Pitt received the splendid prize, and Shelburne was consoled by the coronet of a marquis (of Lansdowne). During the later years of his life his health was delicate, and he withdrew from public life; but he came forward as a strong supporter of the union with Ireland. He indulged his tastes in the adornment of Lansdowne house. Here he collected a splendid gallery of ancient and modern pictures, together with a library of 10,000 volumes, comprising the largest collection of pamphlets and memoirs on English history and politics possessed by any man of his time, as well as a series of MSS., which were sold to the British museum for £5,000. He was a discerning patron of genius. It was while he resided in Lansdowne house as the librarian and friend of Shelburne that Priestley made the discovery of oxygen. Jeremy Bentham was one of his most intimate friends. Shelburne was the patron and friend of sir S. Romilly, and twice offered him a seat in parliament. He was also on terms of intimacy with Mirabeau, Dumont, and other foreigners of literary and political distinction. He died in May, 1805. See *Life of Shelburne*, by lord Edmond Fitzmaurice (London, 1875-76).

SHELBY, a co. in central Alabama, having the Coosa river for its e. boundary; 850 sq.m.; pop. '80, 17,236—17,120 of American birth, 4,982 colored. It is intersected by the Selma, Rome and Dalton, and the South and North Alabama railroads, forming a junction at Calera in the extreme e. section. It is drained in the n.w. by the Cahawba river. Its surface is varied by hill and valley, well wooded with forests of oak, pine, and hickory. Its mineral products are coal and iron ore. Its agricultural products are grain, sweet potatoes, cotton, tobacco, and live stock. Its manufactures are cotton, thread, pig and cast-iron, and lime. Co. seat, Columbiana.

SHELBY, a co. in s. central Illinois; drained by the Kaskaskia, Little Wabash, and Sangamon rivers; traversed by the Ohio and Mississippi, the Illinois Central, and the Indianapolis and St. Louis railroads; 760 sq.m.; pop. '80, 30,282—28,529 of American birth. Surface partly prairie and partly forest; wheat, oats, corn, hay, sorghum, and pork are the staples; there are 6 carriage factories, 2 brick yards, and many flour and saw mills. Co. seat, Shelbyville.

SHELBY, a co. in s.e. central Indiana; watered by Blue river and Sugar and Flat-rock creeks; crossed by the Jeffersonville, Madison and St. Louis, the Indianapolis, Cincinnati and Lafayette, and the Cincinnati, Hamilton and Dayton railroads; about 425 sq.m.; pop. '80, 25,256—24,481 of American birth. The surface is mostly prairie or woodland. The soil is fertile. The principal productions are corn, wheat, oats, and cattle. Co. seat, Shelbyville.

SHELBY, a co. in w. Iowa; drained by the Nishnabotona river and Boyer and Mesquite creeks; 576 sq.m.; pop. '80, 12,696—10,279 of American birth, 13 colored. The Chicago, Rock Island and Pacific railroad crosses the extreme s.w. portion. Its surface is varied by rolling prairies, furnishing excellent pasturage, and long stretches of woodland. The soil is fertile, producing maize, wheat, and oats. Live stock is extensively raised. Co. seat, Harlan.

SHELBY, a co. in n. Kentucky, watered by branches of the Kentucky river; on the Shelby and the Louisville, Cincinnati and Lexington railroads; about 460 sq.m.; pop. '80, 16,813—5,556 colored. The surface is rolling and heavily wooded. The soil is fertile. The principal productions are corn, wheat, oats, and cattle. Co. seat, Shelbyville.

SHELBY, a co. in n.e. Missouri; drained by the n. fork of Salt river, by North Two river, and the South Fabius river; 500 sq.m.; pop. '80, 14,024—13,457 of American birth, 937 colored. It is intersected in the s. by the Hannibal and St. Joseph railroad. Its surface is undulating and thinly timbered. The soil is fertile, producing corn, oats, sorghum, and live stock. Its mineral products are limestone and bituminous coal. Co. seat, Shelbyville.

SHELBY, a co. in w. Ohio; drained by the Miami river and Loramie's creek; traversed by the Cleveland, Columbus, Cincinnati and Indianapolis, and the Cincinnati, Hamilton and Dayton railroads, and by the Miami canal; 420 sq. m.; pop. '80, 24,136—22,064 of American birth, 557 colored. Surface rolling and productive; corn, oats, wheat, hay, and pork are the staples. Co. seat, Sidney.

SHELBY, a co. in s.w. Tennessee, adjoining Mississippi; bounded on the w. by the Mississippi river; drained by Wolf river and Elk creek; crossed by the Memphis and Charleston, the Memphis and Little Rock, the Memphis, Kansas and Colorado, and the Memphis, Paducah and Northern railroads; about 690 sq. m.; pop. '80, 78,433—73,634 of American birth, 43,989 colored. The surface is level and heavily timbered. The soil is fertile. It is the largest cotton-growing county in the state. Co. seat, Memphis.

SHELBY, a co. in e. Texas, having the Sabine river for its e. boundary, separating it from the state of Louisiana; 800 sq. m.; pop. '80, 9,524—9,488 of American birth, 2,154 colored. It is drained by the Attoyac river, which forms part of its w. boundary. Its surface is rolling and largely covered with forests. Its soil is fertile, producing cotton, corn, sweet potatoes, and the products of the dairy. Co. seat, Center.

SHELBY, ISAAC, 1750–1826; b. Md.; was a surveyor in western Virginia; lieutenant in the battle with the Indians at Mount Pleasant, Va., in 1774; capt. of a military company in Virginia in 1776, and in 1777 appointed commissary; was elected to the house of delegates, Virginia, in 1779, and commissioned maj. by gov. Jefferson, and the following year made col.; fought at the battle of King's mountain, and in 1780 received for his bravery a vote of thanks and a sword from the legislature of North Carolina, to which he was chosen a member in 1781; settled in Kentucky and was governor, 1792–96, and again, 1812–16. With 4,000 Kentuckians he aided gen. Harrison at the battle of the Thames, and received a gold medal from congress.

SHELBYVILLE, a city in s.e. Indiana, co. seat of Shelby co., on the Blue river, and on the Indianapolis, Cincinnati and Lafayette railroad at its junction with the Columbus and Rushville railroad; pop. '80, 3,745. It is 27 m. s.e. of Indianapolis, in the midst of a rich farming district, and has a court-house, 7 churches, 2 banks, public schools, 3 newspapers, and a seminary. Lumber and furniture are manufactured.

SHELDON, GILBERT, D.D., 1598–1677; b. England; graduated at Trinity college, Oxford, 1617; became fellow of All Souls' college in 1622; vicar of Hackney in 1633, and rector of Ickford and Newington; was chaplain to Charles I. in 1635; became bishop of London in 1660, archbishop of Canterbury in 1663, and chancellor of Oxford university in 1667.

SHE'LI'F, the chief river of Algeria (q.v.).

SHELL. This term is employed to designate the hard outer coverings of a large number of invertebrate animals. Shells are met with in the *echinodermata*, in the great majority of the *mollusca* (excluding the molluscoids), in a few of the *annelida*, as *Serpula*, *Spirorbis*, etc., in the *cirropoda*, and in the *crustacea*. The forms of the different varieties of shells are sufficiently noticed in the articles on the classes of animals to which they respectively belong; and we shall confine our remarks to the intimate structure of shell, which, until the publications of Carpenter, Rainey, and others, during the last quarter of a century, was altogether misunderstood. The doctrine formerly held, and still maintained in many popular hand-books of conchology, was, that shell is not only extravascular (or devoid of vessels), but completely inorganic, being composed of an exudation of calcareous particles (chiefly carbonate of lime) cemented together by a kind of animal glue. It is now known that shell always possesses a more or less distinct organic structure, which in some cases resembles that of the *epidermis* of the higher animals, while in others it approximates to that of the *derma*, or true skin. The nature of the organic structure is so different in the *echinodermata*, *mollusca*, and *crustacea*, that a separate description is required for each, and as Dr. Carpenter remarks: "Even in the subordinate divisions of these groups, very characteristic diversities are frequently observable, so that, as in the case of the teeth, it is often possible to determine the family, sometimes the genus, and occasionally even the species, from the inspection of a minute fragment of a shell, as well fossil as recent."

In the *echinodermata*, the elementary structure of the skeleton exhibits the appearance of a net-work composed of calcareous and animal matter intimately united. The diameter of these apertures or meshes of net-work varies to a certain degree in different parts of the same shell, the openings being larger in the inner than the outer layers, the extremes being $\frac{1}{15}$ and $\frac{1}{150}$ of an inch. The entire shell is made up of an immense number of such plates, which lie parallel to one another, separated by minute vertical pillars.

In the *mollusca*, the shell is formed upon the surface of the mantle, which corresponds to the true skin of other animals. Hence it must be regarded as epidermic. It consists of cells consolidated by a deposit of calcareous salts in their interior, but, as in the case of many other tissues, the original cellular organization often becomes so hidden by subsequent changes, as to cease to be recognizable. The typical condition of the shell in this sub-kingdom is best seen in certain bivalves—the genus *pinna*, for example.

On breaking off a small portion of the projecting margin of one of these shells, and examining it under the microscope, it is found to be made up of a vast number of prisms, hexagonal in form and nearly uniform in size, which are arranged perpendicular to the surface of the lamina of the shell, so that the thickness of the lamina is formed by their length, and its surfaces by their extremities. On submitting such a lamina to the action of a dilute acid, the calcareous salts are dissolved, and a membrane is left which shows the prismatic structure as perfectly as it was seen in the original shell, the hexagonal divisions being evidently the walls of cells resembling those occurring in the pith or bark of a plant. It sometimes happens in recent, but more commonly in fossil shells, that the animal matter decays and leaves the prisms ununited, and easily separable from one another. It is only in a few families of bivalves that the cellular structure is seen in this very distinct form, or that it makes up a large portion of the shell; and these families are closely allied to *pinna*. In many shells the external layer is formed on the above plan, while the internal layer is nacreous; in many, again, the nacre, or "mother of pearl," and in others sub-nacreous structure, constitutes nearly the whole thickness of the shell. The nacre, according to sir D. Brewster, consists of a multitude of layers of carbonate of lime, alternating with animal membrane; and the grooved lines on which iridescent luster depends are due to the wearing away of the edges of the animal laminae, while those composed of carbonate of lime stand out; it is, however, more probable, from Dr. Carpenter's researches, that the peculiar lineation of the surface of nacre is due to the disposition of a single membranous layer in folds or plaits, which lie more or less obliquely to the general surface.

In the *crustacea*, the structure of the shell has only been examined in the order of decapods. In this order—in the common crab, for example—the shell consists of three layers, viz., (1) an external horny epidermic membrane covering the exterior; (2) a cellular or pigmentary structure; and (3) an internal calcareous or tubular substance. The horny layer is easily detached after the shell has been for some time immersed in dilute acid; it is thin and tenacious, and presents no trace of structure. The pigmentary layer is very thin in the crab and lobster, but is much thicker in some other decapods. The internal layer is that which constitutes the chief part of the shell; it is in this layer that the calcareous matter is chiefly deposited; but even after this has been removed, a very distinct animal basis remains, which closely resembles that which is left after the dentine of the teeth has been deprived of its inorganic constituents.

For further information on this subject, the reader is referred to Dr. Carpenter's various articles on the microscopic structure of shells, and especially to his article "Shell" in the *Cyclopædia of Anatomy and Physiology* (from which the materials of the present article have been almost entirely drawn), and to his *Microscope and its Revelations*.

SHELLDRAKE, or **SHIELDRAKE**, *Tudorna*, a genus of ducks of the section having the hind-toe without any pendent membrane. The shelldrakes are a connecting link between geese and ducks, having much resemblance to the former. The species are mostly natives of the southern hemisphere, but the COMMON SHELLDRAKE (*T. vulpanser*, or *bellonii*) is common on the sandy sea-shores of Britain; many coming from the n. for the winter, and some remaining all the year, and breeding, making their nests in rabbit-burrows or other holes in soft soil, whence in some places the shelldrake receives the name of *burrow duck*. It is a beautiful bird, the sexes nearly alike in plumage; the head and upper part of the neck green, with a collar of white, and a lower collar of rich chestnut, extending over part of the back, the rest of the back white. The whole length is fully two feet. The shelldrake is very capable of being tamed, and breeds in domestication. Its note is a shrill whistle. Its flesh is coarse and unpalatable.—The RUDDY SHELLDRAKE (*T. rutila*), the only other European species, is rare as a British bird, although common in many parts of Europe and Asia.

SHELLEY, PERCY BYSSHE, the eldest son of sir Timothy Shelley, bart., the representative of an old Sussex family, was born at Field Place, near Horsham, in that county, on Aug. 4, 1792. His earlier education he received at home with his sisters. About the age of ten he was sent to a school near Brentford, and thence, three years after, transferred to Eton. Shy and sensitive, yet self-willed and unsubmitive, he suffered much from the harsh discipline of masters and the tyranny of his ruder associates. In his refusal to fag at Eton he gave early indication of that passionate impatience of every form of constituted authority not approving itself to his reason which continued through life to distinguish him, and to find expression in his writings. In 1808 he left school, and after two years passed at home he was sent to University college, Oxford. Even thus early he had become a free-thinker of a somewhat advanced kind, and a pamphlet, entitled *A Defense of Atheism*, which he circulated during the second year of his college course, led to his expulsion from Oxford. This so irritated his father, that for some time he declined to receive him; and on his rash marriage, in Aug., 1811, to a Miss Harriet Westbrook, the daughter of a retired innkeeper, the estrangement between them became final and complete, the old gentleman consenting to allow his son a liberal yearly income, but never after having any intercourse with him. Shelley's marriage was in its issue tragical. In 1813 a separation took place between him and his wife, who, with two children, returned to the care of her father; and three years after the unhappy

woman drowned herself. The refinements of intellectual sympathy which poets desiderate in their spouses, Shelley failed to find in his wife, but for a time he seems to have lived with her not unhappily; nor to the last had he any fault to allege against her, except such negative ones as might be implied in his meeting a woman he liked better. This was Mary Godwin, daughter of the celebrated William Godwin and Mary Wollstonecraft, with whom, in 1814, he traveled in France and Switzerland, and who afterward became his second wife. Such excuse of his conduct in the matter as the theory of "congenial souls" may afford in the eye of the moralist must to the full be allowed for Shelley, whose later union was of almost ideal felicity and completeness. On the death of his first wife he laid claim to his children; but this their grandfather, Mr. Westbrook, strange as it may now seem, successfully resisted at law on the ground of his atheism, as exhibited in the poem of *Queen Mab*, which a year or two before he had printed, though only for private circulation. In 1815, while living at Bishopsgate, near Windsor, he wrote his *Alastor*, one the most finished and characteristic of his works; which was followed by *The Revolt of Islam*, composed in 1817 at Marlow. During the interval, in the course of a tour in Switzerland, he had formed the acquaintance of lord Byron, with whom afterward in Italy he had much intimate intercourse. In Mar., 1818, he left England finally—as it proved—to proceed to Italy; and during that and the following year, chiefly while a resident in Rome, he produced what may rank as his two finest poems—the grand lyrical drama of *Prometheus Unbound* and the tragedy of *The Cenci*. While at Venice with lord Byron in 1820 he wrote *Julian and Maddalo*, a record in enduring verse of an interesting conversation of the discussional kind between the noble poet and himself. His other works of chief importance are: *Rosalind and Helen*, begun before he left England; *The Witch of the Atlas*, written in 1819; *Epepychidion*; *Adonais* (a lament on the death of Keats); and *Hellas* (a lyrico-dramatic burst of exultation on the outbreak of the Greek war of liberty)—all three produced in 1821. The winter of 1822 Shelley passed at Pisa; and in the April following he established himself near Lerici, in the gulf of Spezia. His fondness for boating had through life amounted to a passion, and here he indulged it to the full. On July 8, 1823, in the company of an ex-naval friend, Mr. Williams, he sailed from Leghorn, whither he had gone to welcome his friend, Mr. Leigh Hunt, to Italy, and was lost in a sudden squall on his voyage homeward. The bodies were, after some time, washed ashore, and were burned, as the quarantine law of the country required, in presence of lord Byron, Mr. Leigh Hunt, and another intimate friend, Mr. Trelawney. Shelley's ashes were carefully preserved, and lie buried in the Protestant cemetery at Rome, near the grave of Keats.

In Shelley's opinions, religious, social, and political, crude as they often were, and everywhere expressed with an unwise reckless vehemence, there was much that might reasonably offend; and they not only on their own account roused against him a storm of obloquy, but made him throughout life the accredited mark of the most foul and malicious slanders. To this chiefly it is to be attributed that, whilst he lived, his genius met with no wide appreciation; but since, it has been amply recognized, and perhaps no writer of his time at this day ranks higher on the whole than he. In sustained lyrical impetuosity Shelley surpasses every other writer; his diction is not more remarkable for its opulence than for the expressive subtlety and precision with which it defines the nicest refinements of feeling and thought; and his page flashes with imagery like a royal robe rich with gems. But too often, while he dazzles, he also bewilders; he is fond of supersubtle abstractions, unsubstantial as clouds or dreams; and frequently in reading him we seem merely to be looking on wreaths of rainbow-colored mist. This want of clear and firm outlines is more or less felt throughout all his larger works, with the single exception of *The Cenci*, in which a terrible story of real life is dramatized with consummate vigor and directness of treatment. As to the matter of the rest of his poems, they concern themselves, for the most part, not with the world as it is or has been, but with a perfected world which is to be. Shelley is the *vates* of the future, as Scott is the poet of the past. Of the charge of atheism against Shelley it is enough to say that it rests mainly on his boyish poem of *Queen Mab*; that this he did not himself give to the world; and that when, in 1821, it was surreptitiously published, he issued an express protest against his being held answerable for any opinions set forth in it. In his later works a vague pantheism seems indicated; and one or two passages occur which fairly admit of a purely theistic interpretation. Perhaps the most complete edition of Shelley's poems is that by R. H. Shepherd (1875). A selection from his letters, with translations and prose essays, appeared in 1840. See Medwin's *Life of Shelley* (1849); Trelawney's *Recollections of the Last Days of Shelley and Byron* (Lond. 1858); the *Shelley Memorials*, by lady Shelley (1859); *Shelley's Early Life*, by D. MacCarthy (1872); and *Shelley: A Critical Biography*, by G. Barnett Smith (1877).

By common testimony of all who knew him, Shelley, who was held up to execration as a perfect monster of iniquity, was one of the purest, gentlest, most lovable of men; of the tenderest private affections, and, beyond the immediate circle of these, of the largest flowing charity. The passion of philanthropy expressed in his writings found as practical an expression in his daily life as if he had never made any very great profession of it. The episode of his first marriage seems more or less awkward for him; but the one passionate frailty of a boy can scarcely be held a serious blemish on a man whose whole subsequent life was exceptional in virtue and beneficence.

MARY WOLLSTONECRAFT GODWIN, wife of the poet, was b. in London 1793, married Shelley, as above stated, in 1816, and in the same year produced a remarkable novel, entitled *Frankenstein*, the hero of which, a profound student of nature, discovers the secret of creating life, and produces a monster whose history, though wild and horrible in its incidents, is invested with a strong human interest. The work had a great success, and may be reckoned the best of Mrs. Shelley's literary efforts. Other novels of hers are *Valperga*, *The Last Man*, *Lodore*, and *The Fortunes of Perkin Warbeck*. She likewise wrote *Rambles in Germany and Italy*; a series of biographies of foreign artists and poets for the *Cabinet Cyclopædia*; and carefully edited her husband's poems. She died in London, Feb. 1, 1851.

SHELL-GUNS belong rather to the past than the present, as in modern rifled artillery all guns fire shells. Before their introduction, however, shells were fired from guns of large bore, and proportionately small thickness of metal, not differing materially from howitzers, except that they had greater length.

SHELL-LAC. See LAC.

SHELLS, called in earlier times bombs, consist of hollow vessels of metal, containing gunpowder or other explosive compound, so arranged that it shall explode at a certain point, and spread destruction around by the forcible dispersion of its fragments. The invention of this murderous missile cannot be accurately traced. Shells were employed in 1480 A.D. by the sultan of Gujerat, and by the Turks at the siege of Rhodes, in 1522. The Spaniards and Dutch both used them during the war of Dutch independence; and they appear to have been generally adopted by about 1634. As shells required mortars (q.v.) for their projection, they were not used in naval warfare until the French constructed special bomb-vessels in 1681; but since that period, shell-guns, being cannon of large bore, have been introduced, and shells are now employed by all ships of war.

Until within a few years, every shell was a hollow sphere of cast-iron, varying in thickness from half an in. to 2 in., and in diameter from 5½ in. to 13 inches. The sphere had a fuse-hole (like a bung-hole) an inch across, through which the charge was inserted consisting of pieces of metal and powder to burst the shell. The hole was plugged by a fuse, which was a tube of slow-burning powder, timed to communicate fire to the charge after the lapse of a certain number of seconds. This fuse might either be kindled by hand the moment before the mortar was fired, or its ignition might be effected by the act of firing itself. The Shrapnell shell, introduced by col. Shrapnell of the royal artillery, about 1803, contained a number of bullets, and being fired at bodies of men, it was timed to explode about 100 yards before reaching them, when the shell burst, and the bullets with the fragments continued their course, diverging continually as they went, until they reached their object in a death-cloud. The *concussion shell*, or *percussion shell*, is one in which the charge is fired by the detonation of a cap on striking an object. If sufficiently delicate to explode on touching a soft object, and at the same time not to be exploded by the resistance of the air to its rapid flight, this form of shell is the most certain in execution.

Since the introduction of rifled ordnance, the shell has become the commonest form of projectile. It has ceased to be spherical, and is usually in the shape of an elongated bolt. Several rival shells at present divide public favor, and compete for adoption into war service. Without noticing the numerous varieties which are in course of trial on the continent and in America, the following are the principal British competitors: The *Armstrong* shell is a pointed bolt of iron (usually percussion), containing an inner "segment shell," made up of 49 segments of cast-iron. Seven of these segments form a circle, or ring, and 7 circles give the necessary length. A coating of lead affords a soft medium for fitting into the grooves of the gun. The shell thus made somewhat resembles a bottle without a neck. The necessary bursting charge having been inserted, the rear-end is plugged with lead, the fuse is screwed into the front, and the shell is ready for action. This projectile has a great and accurate range, and its segments cannot fail, on explosion, to do great damage. The principal drawback has been found in the lead-casing, which is often thrown off in parts soon after the shell leaves the gun, and which thus falls among the foremost ranks of the army using it, sometimes inflicting severe wounds. The *Whitworth* shell is an elongated hexagonal bolt of iron or steel, cast in one piece, and with a bursting charge at the rear end. It explodes on percussion; but the space allowed for the burster is deemed insufficient to produce the full effect which the length and correctness of the weapon's range give cause to expect. The *Lancaster* shell is oval, to fit the bore of the *Lancaster* gun (q.v.). *Martin's* shell is charged with molten iron, which sets on fire all combustible matter on which it can be thrown. The *Diaphragm* shell, invented by col. Boxer, R.A., has an iron division or diaphragm to separate the powder in the shell from any balls or slugs, in order that the friction of the latter may not prematurely cause the powder to explode. A six-pounder diaphragm shell contains 30 carbine-balls, an eight-inch shell, 322 musket-balls. The *Palliser* shell, which is now employed in the British service, is chiefly remarkable for the hardness imparted to its fire-point by a process of "chilling" during casting. This gives it a great power of penetration into iron plates, etc.

SHELL-SAND. Sand consisting in great part of fragments of shells, and often containing a small proportion of organic matter, is a very useful manure, particularly for

clay soils, heavy loams, and newly-reclaimed bogs. It is also advantageously applied to any soil deficient in lime. It neutralizes the organic acids which abound in peat and forms with them compounds which serve as food for plants. Great deposits of shell-sand are found on the coasts of Devonshire and Cornwall, and are of great value in the agriculture of that district. Shell-sand is also found on many other parts of the British coast, and nowhere more abundantly than in the outer Hebrides. The sand of many parts of the coast, however, being mostly silicious, is incapable of the same use. Shell-sand is much used as a manure in some of the maritime districts of France, as Bretagne and Normandy.

SHELLY'S CASE. There is a rule of real-property law known as "the rule in Shelly's case," established in a case decided in 1591, and reported in Coke i. 104. "When the ancestor," says Coke, "by any gift or conveyance taketh an estate of freehold, and in the same gift or conveyance an estate is limited, either mediately or immediately, to his heirs in fee or in tail, *the heirs* are words of limitation and not words of purchase." The rule is interpreted by Preston, *Estates*, vol. i. as follows: When a person takes an estate of freehold (i.e., for life) under an instrument which also contains a limitation by way of remainder, with or without an intermediate estate interposed, to his heirs or the heirs of his body, *as a class of persons*, the limitation to the heirs entitles the ancestor to the whole estate. The rule has been abolished by statute in most of the states.

SHELTER ISLAND, a township in Suffolk co., N. Y., comprising the island of that name in Gardiner's bay; 8,000 acres; pop. '80, 732. The island was settled by emigrants from Connecticut in 1652, who bought it from the earl of Stirling. It is near the e. end of Long Island; about 6 m. long; has a fine hotel, and is a very popular summer resort.

SHEMAKHA, the former name for what is now known as the government of Baku, occupying the s.e. portion of Transcaucasia. Area, 14,915 sq.m.; pop. '67, 486,229. North of the Kur and around its mouth the surface is level, low, and fruitful, though little of the surface is under cultivation. Only in the towns and sea-ports, and in the villages in their vicinity, are agriculture and industry pursued. The mountainous regions are inhabited by a rude predatory population.

SHEMAKHA, the capital of one of the six circles in the government of Baku, about 70 m. w.n.w. of the town of Baku. Formerly a thriving town with silk and other manufactures, it was destroyed by an earthquake in 1859. After having been rebuilt it was again destroyed, all but entirely, by another earthquake in 1872. It had a pop. in 1867 of 25,609.

SHEMITIC (Semitic*) LANGUAGES, the general name of a certain number of dialects supposed at one time to have been spoken by the descendants of Shem. The term is of recent origin (Schl  zer, Eichhorn), and a misnomer; for, in the first place, not all the nations derived in Genesis from Shem spoke an idiom akin to those understood by the term Shemitic (e.g., the Elamites, Lud, etc.), and, on the other hand, Canaan and Cush, whose Shemitic speech is undoubted, are there traced to Ham. Shemitic languages, however, as a "conventional appellation," is still the best of all the general terms hitherto proposed (Arabic; Syro-Arabic, analogous to Indo-Germanic).

The family of Shemitic languages which spread originally over Canaan (Phenicia and Palestine), Assyria, Aram (Syria, Mesopotamia, Babylonia), and Arabia; and at a later period over part of Asia Minor and the Punic northern coast—i.e., from the countries on the Mediterranean to the Tigris, and from the Armenian mountains to the s. coast of Arabia—may broadly be divided into three principal classes: 1. The Aramaic or northern (north-eastern) dialect, comprising chiefly the so-called Chaldee and Syriac; 2. The southern, the chief representative of which is the Arabic, closely allied to whose older (Himyaritic) form is the Ethiopic; 3. The Middle, or principally Hebraic, to which also belong the languages of the other Palestinian inhabitants, those of the Canaanites and Phenicians above all. The difference between the middle and northern branches is less sharply marked than between the middle and the southern or Arabic.

Before proceeding to treat of them individually we shall try to point out their general position among other languages, and principally the salient points of difference between the Shemitic and that other most important family of the Indo-Germanic or Aryan languages. First of all, then, we notice the preponderance given in Shemitic to the consonants in contradistinction to the vowels. The former are indeed the basis and the body of its words. The vowels are more or less accessories, modifying, fixing, precisising the meaning, but never themselves containing it, while in the Indo-Germanic languages the root itself consists generally of a combination of vowels and consonants. A further peculiarity is the prevailing "triliteralness" of Shemitic roots in the advanced stage in which we now know them. The Indo-Germanic languages derive their wealth from the logical law of their composition of roots, of verbs, and particles; the Shemitic add to their store in phonetically multiplying their sounds: either by splitting, as it were, their

* In Hebrew, the name from which the adjective is derived, is spelt *Shem*; but, as in many other cases, the *sh* of the original was transformed by the Septuagint into *s* (see SHIBBOLETH); and hence, through the influence of the modern versions that have in this respect followed the Septuagint, the form *Semitic* is more current among continental writers than *Shemitic*.

single consonants into two or more, through the reduplication of radicals, or by the addition of new consonants to the primary root, which is thus developed often from a monosyllabic (for by far the greatest number of Shemitic roots consisted primarily of two consonants only, to which a third was generally added at a later period) into a root of five letters. Compound words are of the utmost rarity both in the noun (except proper names) and the verb, and they never consist of combined roots of verbs and particles, but of verbal and nominal roots. Regarding the formation of cases, tenses, and all those other grammatical changes of noun and verb which, in the Indo-Germanic family, are wrought—as far as the verb or noun itself is concerned—almost exclusively by suffixes, while the radical vowel changes merely according to euphonic rules within its own limited sphere; the Shemitic languages, principally and chiefly work their flections by a change of vowels within the radical consonants, leaving the latter themselves intact. Only when these changes suffice no longer for the more elaborate modes of speech and thought, supplementary letters and syllables are sought in aid and a certain small number of prefixes or affixes represents the vast and varied groups of little words (amounting at times to whole phrases) of the Indo-Germanic. The Shemitic languages are also, if poorer, less complicated in forms than the former family. There are only two genders—which, however, are also distinguished in the second and third persons of the verb—and two principal tenses. These are strongly marked by the position of the personal pronoun, represented by a suffix in the so-called perfect and by a prefix in the so-called aorist or imperfect (future). The former expresses the finite, the completed action, the fact; the latter the incompleted action, the thought, that which is becoming, growing as it were into a fact. One of the most curious features is the sudden change that may be produced in the two by a certain prefixed conjunctive-consonant. Perfect then becomes future, and *vice versa*. Declension in the Indo-Germanic sense exists, if at all, in an extremely limited sense in Shemitic. The juxtaposition of two words (with slight vowel changes) forms the genitive, while the other cases (in the Hebrew at least) are formed by prepositions. The oblique cases of pronouns are indicated by suffixes. The syntax is of the crudest and simplest description: a mere stringing together of sentences without any particular attempt at a logical and methodical arrangement of periods, according to their temporary superior or inferior relation to the subject-matter.

Another most important point of distinction between the two families is formed by what has been called their lexical difference, i.e., the want—except in a few isolated cases—of any correspondence or identity in their individual words. Most of those words which exhibit a similarity can be shown to have been either adopted at a late period, or they simply fall under the category of onomatopoeic words (words imitating the sound of the object expressed, and therefore showing in all cases greater or smaller affinity to the original sound); or, again, words in which the common type of human language would involuntarily and under all circumstances connect a special meaning with a special sound, and would, therefore, be more or less identical in all idioms. Of words introduced into European languages by Shemitic (Phœnician) traders may be instanced, *kanna* = cane, *gumal* = camel, *mor* = myrrh, *kezish* = cassia, *ahelin* = aloe, *nerd* = nard, *carikon* = crocus, *sappir* = sapphire, *sak* = sack, etc. Of onomatopoeic terms, *lakak* = (Sansk. *lih*) to lick, *charat* (Sansk. *charidan*) = to grate, scratch, *galal* = to roll, *parak* = to break, etc. On the other hand, words have crept into Shemitic from foreign languages; e.g., the Egyptian, *ior*, *iero*, *iavo*, river, Nile, is found as *yeor* in Hebrew, *pardes* (Heb.) paradise, is Persian, *kop* (Sansk. *kapa*) is the Heb. for ape, *karpas* (Sansk. *karpāsa*) = wool, cotton, etc.

As regards the age of the family of Shemitic languages, it is matter of great doubt whether or not they were developed earlier than any other, e.g., the Indo-Germanic. The monuments that have survived are not sufficient for us to form a final judgment as yet. It stands to reason, however, that a development may have taken place simultaneously and independently in the idioms of other nations. The notion long cherished (and still upheld by a few isolated speculators) that Hebrew was the original language of all mankind up to the episode of the tower of Babel, may here be passed over without remark. See PHILology.

We shall now endeavor to draw an outline of the relation of the Shemitic languages among themselves, and to cast a rapid glance at their individual characteristics and history, referring for fuller details to the articles devoted to the special branches indicated. Although the Shemitic languages are clearly sister dialects, their relationship is far from being so close as, for instance, that of the different Greek dialects. Thus Abraham, belonging by his descent to a people of Shemitic tongue, and coming from a country where Shemitic was the general language, at his arrival in his new place of abode, inhabited by Shemites, was considered, and considered himself a foreigner to a much greater extent than it would have been the case had a Greek emigrated from one part of Greece into another. It would be more fit perhaps to institute a comparison between the different Shemitic dialects and the Germanic languages among themselves: German, Dutch, Danish, Swedish, Norwegian, etc.; or the Slavonic idioms: Lithuanian, Lettish, Russian, Polish, Bohemian. But even these are not so far removed from each other as the Shemitic idioms. What the latter have in common are those grammatical and other characteristics indicated above, and the *root-words* themselves, which nearly

everywhere have the same original signification; only that in this respect the Arabic shows by far the largest development of meanings out of the single roots, and consequently an unparalleled wealth of derivatives. Yet it must not be forgotten that our relics of ancient Hebrew are of a scanty nature, and that the Arabic has remained a living language until our day, and has, through Islam, spread further than any ancient and perhaps even modern language.

Regarding the much-vexed question as to which of the Shemitic languages is the oldest, it must be confessed that no positive result has yet been attained. For although the oldest palpable monuments of Shemitic have survived in Hebrew, while our earliest documents in Aramaic date from Cyrus, and those in Arabic, even centuries after Christ (Himyaritic, Ethiopic, 4th c.; northern Arabic, 6th c. A.D.), yet we cannot now decide which of these has preserved the type of the original mother-tongue most intact. It sometimes happens that vast internal movements, or a series of events in the history of a people—wanderings, wars, and the like—change, quicken, and develop its language even to decay, before it has had time to beget a literature. When this time does arrive, we meet already with all the traces of this decay in imperfections, corruptions, and archaisms of form. Thus, the Hebrew of the Bible, that is the most ancient form in which it has survived, offers more grammatical analogies (in incomplete structure, inflection, etc.) to the modern than to the ancient Arabic, which lasted in its primitive purity and fullness of form as long as the simple life of the dwellers in the desert was not broken by those events which upheaved, from the time of Mohammed, their whole existence, and brought them in closest and most violent contact with other nations of other tongues. Then that process of decomposition, or phase of negligence and corruption, set in, which resulted in the looseness exhibited by modern Arabic. It thus reached the downward stage of the Hebrew of the Old Testament at ever so much later a period. Arabic classical literature thus exhibits, compared with the Hebrew, and even more with the Aramaic—which we meet in a worse state of aged and crippled organism and stunted form—about the same vigor, freshness, and fullness of form and structure which the Sanskrit exhibits among the Indo-Germanic or the Gothic in the narrower circle of the Germanic dialects. With all this, however, we cannot absolutely decide in favor of the Arabic as the nearest approach to the original type. The phase in which it enters into our historical horizon may be as far if not further removed from it even as the Aramaic. Its hasty individual development may have quickened more radical changes than even the decaying or decayed other branches present. So that, as we said, for the present at least, the question of priority must remain open. We shall, however, allot the first place to the second or southern Shemitic (Arabic) class, simply because of its copiousness of words and development of forms. A faint trace of its peculiarity of article (*al*) is supposed to be found in Gen. x. 26 (*Almo-lah*); but this seems fallacious enough, considering that the Hebrew article must have been originally the same, and the word may simply exhibit the ancient Hebrew form. In the golden epoch of the Hebrew literature, Arab culture does indeed seem to have stood in high renown—Solomon's wisdom is likened unto that of the Arabs, queen Sheba is an Arab queen, and Job's friends are Arabs. On its peculiar history and development, however, we cannot here dwell. See ARABIAN LANGUAGE AND LITERATURE. Suffice it to observe generally that Arabic is not only the richest of Shemitic, but one of the richest of all languages, with its more than 6,000 word-roots, and about 60,000 words; while the Hebrew has about 2,000 of the former and 6,000 of the latter. The 22 consonants of the Aramaeans, and the 23 of the Hebrews, have been augmented into 28 with the Arabs. They further have twice the number of the Hebrew regular conjugations, in which again the latter exceed the Aramaic by one. The same abundance is noticeable in the Arabic tenses, declensions, etc. The general wealth of this language, however, will be best appreciated by its possessing some thousand different terms for a sword, and a proportionate number of words for lion, serpent, and the like; while on the other hand, its adaptability and versatility is shown by one word often possessing a vast number of meanings. Anciently it had two principal branches: the Himyaritic, spoken in the south, which has perished almost completely (a few partly mutilated inscriptions, recently brought to the British museum, have been published some time ago, and their interpretation has been attempted by Osiander and Levy in the *Ger. Or. Society's Transactions*), and the Koreishite, which, being the idiom of Mohammed's tribe, became the paramount Arabic for all times. The Ethiopic (see ETHIOPIA) is by some investigators held to have flowed from the Himyaritic; but from the 14th c., the Amharic dialect (also Shemitic, but with little capacity for writing purposes) has superseded the Ethiopic almost completely.

The north Shemitic or Aramaic, to which we now turn, is the language of the whole district between the Mediterranean and the Tigris, s. of the Taurus, n. of Phœnicia, the Israelitish territory, and Arabia. Here we have again to distinguish between Syria Proper, Mesopotamia (between Euphrates and Tigris), and Babylonia (s. of Mesopotamia), whither the Israelites were carried by Nebuchadnezzar. Yet, with respect to this latter country, it can hardly be doubted that another dialect besides the Aramaic was spoken in it. But whether this was "Medo-Persian," ("like the Assyrian"), or some other "Turanic" idiom, largely mixed with Shemitic ingredients, must remain doubtful until our knowledge of "Turanian" and our reading of cuneiforms shall have advanced somewhat further. There is, however, but one voice among competent investigators, that

whatever strange elements the Babylonian and Assyrian languages may contain, they have a full claim to be reckoned among the Shemitic. The Aramaic in general is, as has been observed before, poorer than the Hebrew in grammatical forms, vowels, etc., besides having a peculiar tendency to blunting its consonants, changing its *s* into *d*, *ts* into *t*, *sh* into *th*, and the like. It further does not express its article by a prefix, but by an *Aluf*, and it forms its passives, not by a change of vowels, but by a special syllable prefixed to the root. The first distinct trace of a difference between Hebrew and Aramaic is found in Gen. xxxi. 47, where it is found necessary to translate Laban's designation of the stone-heap erected in memory of his peace with Jacob. Although the ancient Babylonians had, in all probability, a rich and important literature; yet nothing of it has survived. The so-called Babylonian fragments supposed to have come down in Arabic translations are a mere fiction. All the Aramaic literature which we now possess is derived from the Jews, and of a very late date. The Babylonian exiles, both those who returned to Palestine and those who stayed in the land of their captivity, made Aramaic their habitual language. It was the common tongue of Palestine at the time of Christ, the Hebrew being then chiefly the "holy language";—i.e., the language of temple and synagogue. Thus the Shemitic words used in the New Testament are one and all Aramaic (Mammon; Raka; Eli, Eli, etc.; Talitha Kumi; Abba; etc.), and the same may be said of the Shemitic terms found in Josephus. The oldest remains in this idiom (variously called Hebraisti, Arami, Sursi, Chaldee) are certain portions of the Old Testament (Daniel, Ezra, etc.), the Targums (q.v.), the Mishna (to a certain extent at least), the Talmuds, and the Midrashim. Idiomatic shades are again observable in these different documents; but while, as a living language, it was spoken and pronounced differently in the different districts of Palestine and Babylon, yet the special subdivisions into special provincial dialects which have been attempted can hardly be said to be correct. From the 3d c. A.D. Christian writers, chiefly in Mesopotamia, Edessa, Carrhæ, Nisibis, began to use this language in their writings, which are principally theological (translation of the Bible) and dogmatical, but which also treat of medicine, history, philosophy, mathematics, etc. Yet their Aramaic assumed a character so essentially different that, in some respects at least, it became an entirely distinct dialect, viz., Syriac, which, at a later period, assumed also—to make the breach complete—an alphabet of its own (Estrangelo). Many have been the attempts to account for this strange difference (the very existence of which was, on the other hand, almost totally denied at one time), but with no satisfactory result. Certain it is that the mere geographical reasons (east and west Aramaic, etc.) do not hold good, and are arbitrary and fallacious. The Syriac, as a living language, ceased to be spoken since the 10th c., and only a few Syrian Christians in Kurdistan and Mesopotamia are supposed to use a kind of vulgar Aramaic. Syriac literature ceased about three centuries later. As the language of the church, however, it is still in use with the Jakobite, Nestorian, and Maronite branches of the Syrian church. Minor sister dialects of Aramaic are the Samaritan, a corrupt Judæo-Aramaic mixed with Arabic words; the Zabian or Nazarean (Mandaic) the language of a theosophical sect ("disciples of John the Baptist") standing between the Syriac and Chaldee, and mixed with Persian, but bearing altogether the stamp of an uncouth, ungrammatical, sadly-neglected idiom; further, the Palmyrene (Palmyra), which, with a written character closely akin to the square Hebrew, offers but little variations from the Syriac; and finally, the Egypto-Aramaic, which is found on a few monuments (stone of Carpentras, Papyri), and probably belongs to Jews, who, at a late period, had immigrated into Egypt, and had adopted the Egyptian religion. Its words are principally Judæo-Aramaic, but with a large infusion of foreign elements.

The third principal branch, the middle Shemitic, which comprises Hebrew and Phœnician (Punic)—and all the questions connected with these—have been discussed at some length under JEWS and PHœNICIA to which we refer. See also the special articles ARABIC, CHALDEE, ARAMAIC, etc.

SHEMITIC NATIONS or SHEMITES. The different nations generally comprised under this name, viz., the Assyrians, the Chaldeans or Babylonians, the Syrians, Phœnicians, Hebrews, Arabs, and Ethiopians, are all treated specially in the course of this work; it only remains here to add a few observations on the characteristics ascribed to them all in common, and on the influence they have exercised upon the history and development of humanity. As regards the language, the poverty of the inflections, the well-nigh absolute impossibility of expressing abstract ideas, the general absence of compound verbs and substantives, and the primitive state of the syntax in the Shemitic, as contrasted with the wealth and vigor of the Aryan, have been noticed in the previous article. From this arises, as an almost natural consequence, the general inferiority of Shemitic literature to what we emphatically call "classical literature." Certain most important forms of Indo-Germanic poetry, for instance, are completely wanting in the Shemitic, such as the epopee and the drama; although, on the other hand, the peculiar ancient form of Arabic poetry—the *Kasida*—and the grand bursts of pathos found in the religious books of the Hebrews are vainly sought in Indo-European literature. Again, a primitive state of law seems to have developed among the Aryan nations, the chief characteristic of which was a recognition, albeit a dim enough one, of individual rights, in as far as they did not war against the complex unity of the "state." With the

Shemites, in the absence of that talent for organization and conciliation which is so essential a mark of the Indo-Europeans, we find either a patriarchal, an anarchical, or a despotical kind of government. Science and philosophy, in the larger sense of the word, are the almost exclusive property of the Aryans. The inferiority of the Shemites in these respects, however, is amply counterbalanced by the sublime place they take as the ethical teachers of all humanity. How the hard and narrow egotism which, not quite unjustly, is ascribed to them ever came to bear and ripen those grand moral maxims with which we meet in the earliest Jewish records, and which, wrought up to their purest idealism, form the shining glory of the New Testament, is a problem of which some seek the solution in a peculiar *intensity* of character inherent in the Shemitic races; while others account for it by direct "inspiration." The same may be said of that monotheism which belonged, in the first instance, to the Hebrews out of all the nations of the earth. It is a grave mistake, however, to describe, as Renan does, the Shemites indiscriminately as monotheists. Babylon and Assyria, and Syria or Phœnicia, and the ante-Islamic Arabs, were neither more nor less polytheistic than the early or present inhabitants of India. And, we may well add, not before their return from the Babylonian exile are the Jews themselves, as a body, to be considered as real monotheists. But ever since, both they, and, from the time of Mohammed, the Arabs, have been the representatives of a more austere and exclusive dogma of the unity of the godhead than a great part of the civilized world has found good to accept up to this day. Both Christianity and Islam, the most powerful religious agents, the one for nearly 2,000 years, the other for about 1200, are in their origin Shemitic, and their influence need not here be enlarged upon. For what we owe to the Shemites in the field of industry and inventions, and the civilization these carried with them wherever they were imported, we need only refer to PHœNICIA. Nor ought we to forget that the very alphabet itself is of Shemitic origin.

SHEMITIC PLURAL. The Shemitic languages, particularly the Hebrew, often use the plural where other languages only make use of the singular. This is particularly the case in terms of space and time—their vastness being conceived, so to say, as a multiplicity. Thus certain regions, like heaven—which, through the influence of the Bible language, is also with us sometimes used *pluraliter*—the expanse of water; further, the place at a person's head or feet, or even certain limbs of the body (conceived as space), like neck, face, etc.; or, again, periods of times, like youth, age, life, and special *lasting* qualities or states, like barrenness, blindness, mercifulness, and the like, are put in plural number, where we have the singular only. It is further applied to might and strength, as consisting originally of a multiplicity of elements of power. This is particularly shown in the word Elohim (q.v.),=a unity of many "mights"—i.e., the Supreme Being. The false conclusions as to the plurality of the Divine Persons being proved by this word are best refuted by the occurrence of the plural in the word Master (Adon), Lord (Baal), when these stand unmistakably for a single human individual, and are meant to express merely his proprietorship of some object or other.

SHENANDO'AH, a river of Virginia, the largest tributary to the Potomac, drains the beautiful and fertile valley between the Blue ridge and the principal range of the Alleghanies. It rises in two branches near the center of the state, and runs n.e. to the Potomac, 170 m., being navigable for small boats 100 miles. In the war of 1861-65 this valley was the scene of numerous conflicts, was successively occupied by the opposing armies, and finally laid waste by gen. Sheridan in the autumn of 1864.

SHENANDO'AH, a co. in n. Virginia, bounded on the s.e. by the Massanutten mountain, drained by Cedar creek, and the n. fork of the Shenandoah river; on a branch of the Baltimore and Ohio railroad, and the Virginia Midland; about 500 sq.m.; pop. '80, 18,204—1006 colored. The surface is heavily wooded. The soil is fertile. The principal productions are corn, wheat, and cattle. Co. seat, Woodstock.

SHENDY, a t. of Africa, in lower Nubia, on the right bank of the Nile, 100 m. in direct line below Khartoum. At its markets, two of which take place every week, a large variety of articles, as wheat, straw, salt, and cotton goods, are sold. Near the town, which gives name to a large district, the finest senna is obtained. Pop. about 10,000.

SHEN-SEE, a province of China, on the Hoang-Ho; bounded n. by Mongolia. The Hoang-Ho forms most of its e. boundary, and it is intersected by the Hooi-Ho; 67,400 sq.m.; pop. 10,207,256. The productions are wheat, millet, rhubarb, and ginseng. The surface is mountainous, and iron, gold, porphyry, jasper, and copper are abundant. The principal manufactures are agricultural and military implements, and felt for military cloth.

SHENSTONE, WILLIAM, the son of Thomas Shenstone of the Leasowes, Hales Owen, Shropshire, and his wife Anne Penn, was born there in the year 1714. In 1732 he was sent to Pembroke college, Oxford. While there he devoted himself much to the study of English poetry, and in 1737 he published without his name a small volume of miscellaneous verse. Subsequently, for some years, he lived in a somewhat vagrant way, yet without ceasing to cultivate his talent. In 1741 appeared his *Judgment of Hercules*; and next year, *The Schoolmistress*, the work by which chiefly he continues to be remembered. In 1745, his parents being dead, he established himself on his property of the

Lensowes, where he thenceforth continued to reside. He busied himself with landscape gardening, and such was his success in beautifying his little estate, that it attracted visitors from all quarters, and brought him more fame than his poetry. He was thus, however, led into serious pecuniary embarrassments, from which, on Feb. 11, 1763, a putrid fever relieved him.

The Schoolmistress, which has secured for its author a permanent if humble place among English poets, is written in the stanza and antique manner of Spenser's *Fairy Que n*; and in the contrast between the stateliness of the vehicle, and the familiar and homely quality of the subject, with the graphic truth of its treatment, there is a singular source of charm. The other works of Shenstone are for the most part quite insignificant; but his *Pastoral Ballad* has touches of exquisite tenderness and truth of sentiment expressed in a simple and appropriate melody.

SHEOL (LXX. *Hades, Thanatos, Vulg. Inferi*), a Hebrew term of very frequent occurrence (65 times) in the Old Testament, and rendered by the authorized version: grave, hell, or pit. Its derivation is doubtful: while some connect it with a root, denoting to seek, others derive it from a root, "to dig out," "to hollow" (compare Germ. *Hölle*). The use of the word in the original would seem to prove a great fluctuation of the dogma respecting the world to come, during the various periods represented in the special parts of the Bible. Sometimes it does stand unmistakably for "tomb," although our notions of an artificially prepared grave do not originally belong to it; at other times, it is the abode of disembodied spirits, whether good or evil. It is the place where the dead go to be united with their "people," their "ancestors," friends, and all the departed. It was placed in the center of the earth, or below the ocean, and was a dismal dark place, like the Orcus, or Tartarus. It has gates and bars, it has chambers, valleys, and rivers, and its inhabitants—the shadows—(*rephaim*=feeble ones), who ordinarily enjoy deep repose in this "reign of silence," are troubled by being called up to the surface, or tremble at the arrival of some great tyrant. As the receptacle of all things, it contains the shadows even of trees and kingdoms. It is described as all-devouring, remorseless, and insatiable. There can be no doubt of the existence of an idea—however vague—if not of immortality, in the modern sense, yet of some state after life among the Hebrews, even in the earliest times. For the Gehenna (Ge-Hinom) of the New Testament—the contemporaneous Sheol—see HELL.

SHEPARD, CHARLES UPHAM, LL.D., b. R. I., 1804; graduated at Amherst college, 1824; studied botany and mineralogy at Cambridge, and taught them at Boston; was assistant to prof. Silliman at Yale two years, and lecturer on natural history, 1830-47; professor of chemistry and natural history, Amherst, 1845-53; in the medical college at Charleston, S. C., 1854-61; professor of natural history again at Amherst from 1861 to the present time. He has formed at Amherst a remarkably fine collection of minerals and meteorites; and is author of a treatise on mineralogy, a report on the geology of Connecticut, and many scientific papers.

SHEPARD, THOMAS, 1605-49; b. England; graduated at Emanuel college, Cambridge, 1627; became a preacher and was silenced for non-conformity; arrived at Boston, 1635; aided in establishing Harvard college, 1636, and became pastor of the church in Cambridge as successor of the rev. Thomas Hooker, after whom he was esteemed the most learned theologian in New England. Among his writings published during his life are: *New England's Lamentation for Old England's Errors*; *The Sound Believer*; and *Theses Sabbaticæ*. He left also numerous MS. works—some of which have been published in England—and an autobiography, first printed at Cambridge, 1832. An edition of his works, in 3 vols., was published in Boston, 1853.

SHEPARD, WILLIAM, 1737-1817; b. Mass.; was capt. under sir Jeffrey Amherst through the French war, and during the revolution took part in 23 engagements; became a farmer at Westfield, Mass.; as brig.gen. of militia defended the arsenal at Springfield in the Shays insurrection, and was afterward maj.gen. of militia; was a member of the executive council 1788-90, and of congress 1797-1803. In his old age he was very poor.

SHEPHERD-KINGS. See **HYKSHOS**, *ante*.

SHEPHERD'S DOG, OR **SHEEP DOG**, the most useful and valuable of all kinds of dog, and universally employed by shepherds throughout Europe, and in the countries colonized from Europe, and also in some parts of Asia, to assist them in the tending of their flocks. Without it the shepherd would be utterly incapable of taking care of the great number of sheep often under his charge; and the expense of keeping the requisite number of shepherds would far more than take away the profits of sheep-farming. That the dog was employed in the tending of sheep in very ancient times we learn from the allusion to the dogs of the flock in Job xxx 1. Buffon imagined the shepherd's dog to be the original of all the domesticated dogs; but was unable to assign any good reason for such an opinion. The shepherd's dog exhibits nearly the same characters in all parts of Europe, although there are slight diversities in different countries, as between that of England and that of Scotland, there known as the *collie*. It is of middling size—differences of size, however, being among the characteristics of different races; of rather slender form, with a pretty sharp muzzle; the ears erect, or, in some races, drooping at the tip; the

hair soft, long, shaggy, and somewhat waved; the tail slightly pendulous, more or less recurved, and very bushy; the feet well protected by hair, so as to be adapted for rough ground. The eye is very bright and intelligent, although the ordinary demeanor of the animal is remarkably calm and quiet. No kind of dog is more intelligent, and perhaps none so docile. Its ready comprehension of the meaning of its master, its prompt obedience to his word or gesture, its evident knowledge of what is requisite to be done, and the services which it performs can never be observed without admiration. A shepherd's dog exhibits the utmost care to prevent sheep from straying off the road along which they are being driven, and sets itself, often of its own accord, to watch any gate or gap in the fence, or goes immediately to bring back stragglers. It is equally useful on the bleak moor or wild mountain, readily going for sheep, and bringing them from a distance. The sheep become perfectly acquainted with it, and evidently regard it as a friend, and not as an enemy, although the appearance of any other dog would alarm them at once. It knows the sheep of the flock it is required to attend, and even in a crowded market adroitly separates them from others with which they have become mingled. Its remembrance of places is obviously very accurate; and a dog which has found great difficulty in conducting sheep through crowded thoroughfares does the same work much better on subsequent occasions. The intelligence of the shepherd's dog has sometimes been proved in a very remarkable way by dishonest masters employing them to steal sheep; the master merely indicating by some sign the sheep which he wished to add to his own flock, and leaving the dog to do it in his absence. For stealing sheep in this way, a farmer in the s. of Scotland was hanged about the end of last century. More frequent instances are on record of the shepherd's dog, conducting a flock of sheep safely home for many miles, unaccompanied by the shepherd. The shepherd's dog is affectionate, and becomes strongly attached to its master, but is generally shy to strangers. It is generally treated with great gentleness by the shepherd; no severity is used in its training, nor could be used with advantage. It is very muscular and active, and capable, perhaps beyond any other kind of dog, of continuing its exertions during a long time.

The shepherd's dog is often crossed with other kinds of dog, and particularly with the pointer and setter. Dogs are thus obtained which, whilst capable of all the services required by the shepherd, are equally capable of being employed in the pursuit of game, and are most successful in night poaching.

The *drover's dog* is very often a cross between the shepherd's dog and the mastiff, the foxhound, the pointer, or the grayhound. It displays many of the best qualities of the shepherd's dog, and if too frequently very different from it in its cruel treatment of sheep, the fault is originally that of the brutal master.

SHEPHERD'S PURSE, *Capsella*—formerly *Thlaspi*—*Bursa pastoris*, an annual plant of the natural order *cruciferae*, a most abundant weed in gardens and cornfields in Britain, and remarkable as one of the few plants that are found over almost the whole world, adapting themselves to almost all soils and climates. It is a very variable plant, from 3 in. to 2 ft. in height, with root-leaves more or less pinnatifid, all the leaves more or less toothed, and rough with hairs. The root-leaves spread closely along the ground. The flowers are white and diminutive. The pouch, from which the English name seems to be derived, is laterally compressed, and somewhat heart-shaped. This is a troublesome weed where it abounds, but, being an annual, it is extirpated by continual and careful cultivation.

SHEPLEY, ETHER, LL.D., 1789–1877; b. Mass; educated at Dartmouth college, and practiced law in Portland. He was U. S. attorney for Maine, 1821–23; U. S. senator, 1823–36; justice of the Maine supreme court, 1836–48; and its chief justice, 1848–55.

SHEPLEY, GEORGE F., 1819–78; b. Maine; graduated at Dartmouth college, 1837; studied law at Harvard university and at Portland, practiced law at Bangor in 1840. He was U. S. district attorney under pres. Polk, residing in Portland, and filled the office until 1861. In the war of the rebellion he was col. 12th Me. vols., afterward commanded a brigade in gen. Butler's expedition. He was placed in command of the city of New Orleans and appointed military governor of Louisiana; held a similar position in Richmond after the surrender in 1865; U. S. circuit judge, first circuit, 1871.

SHEPPEY, ISLE OF, a portion of the county of Kent, insulated from the main-land by the Swale, an arm of the estuary of the Medway, is 9 m. long, and 4 m. broad. In early times, its dimensions were much greater, but the sea has encroached upon, and is gradually eating away, the northern shore, which is lined by cliffs of London clay, from 60 to 80 ft. in height. The church of Minster, formerly in the middle of the island, is now on the n. coast. Great numbers of interesting fossils are found imbedded in the London clay, of which the whole island is composed. In the n. of the island, corn is grown, but the s. districts, which are low, are laid out in grass. Almost the whole of the inhabitants are massed in the sea-port of Sheerness (q.v.).

SHEPTON MALLET, a market t. of Somersetshire, 5 m. e.s.e. of Wells. It is a town of considerable antiquity, and is mentioned in *Domesday Book* as Sepeton. Its grammar-school, free to twelve boys, was founded in 1627. Worsteds stockings, crape, serge, and velvets are manufactured. It contains several large breweries. Pop. '71, 4,363.

SHER BET, an oriental beverage, much used in Mohammedan countries, where stimulating drinks are forbidden. It consists of the juices of various fruits diluted with water, and sweetened exactly in the way in which lemonade is made in Europe.

SHER BORNE, a market t. of Dorsetshire, on the river Yeo, 18 m. n.n.w. of Dorchester. The King's school, founded in 1550, has an endowment of nearly £1000 a year, and several exhibitions of £40, tenable for four years at either of the great English universities. There are several silk-throwing mills. Pop. '71, 5,545.

Sherborne was the Saxon Scireburn (*scar burna*, clear brook). It was erected into a bishopric in 705, and remained the seat of a bishop till 1075 or 1076, when the see was removed to Old Sarum. It was a prosperous place, and the seat of considerable cloth manufactures in the time of Leland and Camden.

SHERBROOKE, a co. in s. Quebec, consisting of the townships of Ascut and Oxford; 220 sq.m.; pop. '71, 8,516. It is intersected by the St. Francis, Megantic, and International railroad, the Massawippi Valley, and the Grand Trunk forming a junction at its county seat. It is drained by the river St. Francis, having valuable water-power, and by the Magog and other small lakes and streams in the w. and s., and lake Memphremagog, bordering on the s.e. Co. seat, Sherbrooke.

SHERBROOKE, a t., capital of Sherbrooke co., Canada; on both sides the Magog river, 80 m. s.e. of Montreal, on the Grand Trunk railroad; pop. '71, 4,432, of whom many are of French origin. The place has a bank, 3 weekly papers, an academy, and many manufactures of machinery, tools, flannel, woolen, and cotton goods. It is one of the important towns in eastern Canada, and has many pleasant residences.

SHERBURNE, a co. in e. Minnesota, having the Mississippi river for its s. and s.w. boundary; 420 sq.m.; pop. '80, 3,855—2,875 of American birth; it is intersected by the St. Paul and Pacific railroad; it is drained by the Elk river, several small lakes, and the Rum river in the n.e. It has extensive tracts of woodland, alternating with fertile plains, producing grain and sweet potatoes. Large numbers of live stock are raised; and that pursuit, with the lumber business, is the principal industry of its inhabitants. Co. seat, Elk River.

SHERIDAN, a co. in central Dakota; about 1700 sq. miles. It is as yet unorganized.

SHERIDAN, a co. in n.w. Kansas, drained by the Saline river in the s., Prairie Dog creek and the North and South forks of Solomon river traversing it latitudinally; 900 sq.m.; pop. '80, 29,092—26,124 of American birth, 5,441 colored. The surface is undulating and the soil is very fertile and well adapted to stock raising.

SHERIDAN, PHILIP HENRY, b. Ohio, 1833; graduated at the military academy at West Point in 1853, and, being assigned to the infantry, served on frontier duty in Texas for nearly two years, and in Oregon, 1855-61. At the commencement of the rebellion he was appointed quartermaster of the army of s.w. Missouri, and in April, 1862, chief quartermaster of the western department. In May, 1862, he was appointed col. of the second Michigan volunteer cavalry; was commissioned brig.gen. of volunteers, July 1, 1862; and soon afterward was put in command of the 11th division of the army of the Ohio. He commanded a division in the army of the Cumberland, and at the battle of Stone river, Dec. 31, 1862, saved the army from being routed by his stubborn resistance, for which he was made maj.gen. of volunteers. In the march toward Chattanooga in 1863, he was very active; and in the battle of Chickamauga, though swept off the field by the breaking of the lines, he recovered himself and returned with his own command and some other troops to support gen. Thomas. In April, 1864, he was called to the army of the Potomac by gen. Grant. He was given command of the cavalry corps, and during May, June, and July, besides protecting the flanks of the army and reconnoitering the enemy's position, was successfully engaged in eighteen different actions. In Aug., 1864, he was placed in command of the army of the Shenandoah; and soon afterward of the middle military division, gaining several successes over gen. Early, for which he was made a brig.gen. of the U.S. army, and in the following November maj.gen. After completely crushing Early's army, he desolated the whole region along the banks of the James river, effectually cutting off all supplies for the confederate army from the north. He then made a detour around Richmond, joined gen. Grant's army at City Point, whence he started Mar. 25, 1865, to strike the final blow for the overthrow of gen. Lee's army of northern Virginia. He fought the battle of Dinwiddie Court-House, Mar. 31; and that of Five Forks, which compelled Lee to evacuate Richmond and Petersburg, April 1. He followed these victories by attacking and harassing the confederate troops during their flight, which led to the surrender of Lee at Appomattox Court-House, April 9, 1865. He was appointed to the command of the military division of the s.w., June 3, and of the military division of the Gulf, July 17; of the department of the Gulf, Aug. 15, 1866; of the fifth military district, including Louisiana and Texas, Mar. 11, 1867; and of the department of the Missouri, with headquarters at fort Leavenworth, Sept. 12. He was made lieut.gen., Mar. 4, 1869, and given command of the division of the Missouri, including the departments of Dakota, of the Missouri, of the Platte, and of Texas, with headquarters at Chicago, which office he holds at the present time. During the political disturbances in Louisiana in 1875, gen. Sheridan was

ordered to New Orleans, and on quiet being restored returned to his command at Chicago.

SHERIDAN, RICHARD BRINSLEY, was the son of Thomas Sheridan, a lecturer on oratory and elocution, in his day of some notoriety. He was born at Dublin in Sept., 1751, in due course was sent to school there, and afterward removed to Harrow. He gave no promise as a boy of the brilliancy he afterward displayed as a man, being pronounced a hopeless dunce by all his teachers. He does not seem to have been brought up to any regular employment; and after his elopement and marriage in 1773 with a Miss Linley, a public singer of great beauty and accomplishment, his prospects did not seem bright, more especially as he insisted, on a point of pride, that his wife should give up her profession. As the readiest resource he betook himself to literature. The lighter drama was the sphere which attracted him, and in Jan., 1775, his first comedy, *The Rivals*, was produced. Damned on its first appearance, through certain deficiencies in the acting, this piece on its repetition found gradually the favor with the public which its wit and vivacity deserved, and made the reputation of the writer. In the course of the year following Sheridan followed up his success by a farce of no very great merit, entitled *St. Patrick's Day, or the Scheming Lieutenant*, and a second comedy, *The Duennas*, amid the sparkling dialogue of which are interspersed some songs of exquisite merit. He now became in some unexplained manner—for though his pieces were most successful they could scarcely have brought him the necessary funds—part proprietor of the Drury Lane theater; and in 1777 his *School for Scandal* was produced there. This, which is by much his greatest effort, instantly leaped into the popularity it has ever since continued to retain. His other works for the stage were the inimitably clever farce, *The Critic* (1779), and, after a long interval, *The Stranger* and *Pizarro* (1798), both adapted from the German of Kotzebue. During this interval he was deeply engaged in politics. Sheridan's wit and sprightliness coruscated in society as brightly as they did in his comedies; he was an admirable table-companion—over a bottle the best of then living good-fellows. With Fox and his wild set these gifts made him a prime favorite; and through the influence of Fox it was that in 1780 he was returned to parliament for the borough of Stafford. In his politics he faithfully followed Fox, and the whig party from time to time had good service from their brilliant recruit. He never failed to amuse the house, and when stirred by the trumpet-call of a great occasion, he was capable of rising to heights of noble eloquence. In particular, his famous speech urging the impeachment of Warren Hastings (q. v.), is still traditionally remembered as perhaps the very grandest triumph of oratory in a time prolific of such triumphs.

In 1792 Sheridan lost his wife; and three years after, he was married again to a Miss Ogle, who brought him £5,000, to Sheridan no doubt welcome, though trifling as a relief to the difficulties in which he had become involved, and which more and more continued to accumulate upon him. Always the most reckless and improvident of mortals he did not improve with time. His later years were years of wretched struggle, of which debt, duels, and dissipation may furnish a convenient alliterative summary. His health failed him with his fortunes; and his friends, not finding him in his sickness and adversity quite so amusing as formerly, naturally failed him also—notably and shamefully, the prince regent, whose dull brains over the wine cup he had many a time been made use of to brighten. Some honorable exceptions there were, among whom the poets Rogers and Moore may be mentioned as steadily kind to him to the last. He died in London on July 7, 1816, in his 65th year.

See his biography by Moore, and (for a just and delicate appreciation of his genius) Hazlitt's *Lectures on the Comic Writers*. A good edition of his works, edited by F. Stainforth, was published in 1874.

SHERIDAN, THOMAS, 1721–88; b. near Dublin, Ireland; educated at Trinity college. In 1743 he entered the dramatic profession, played at Drury lane and Covent garden; managed the Dublin theater until 1754, when a political riot occurring in the theater compelled him to retire. With the exception of one or two brief re-appearances on the stage, the rest of his life was spent as a lecturer on elocution at Oxford, Cambridge, and elsewhere. He published a *Life of Swift*, a dictionary, and lectures on reading and elocution.

SHERIFF (Arab. noble), designates, among Moslems, a descendant of Mohammed, through his daughter Fatima and Ali. The title is inherited both from the paternal and maternal side; and thus the number of members of this aristocracy is very large among the Moslems. The men have the privilege of wearing green turbans, the women green veils, and they mostly avail themselves of this outward badge of nobility—the prophet's color—while that of the other Moslems' turbans is white. Many of these sherifs founded dynasties in Africa; and the line which, nowadays, rules in Fez and Morocco, still boasts of that proud designation.

SHERIFF (A.-S. *scir-gerefa*, the reeve or fiscal-officer of a shire; compare Ger. *graf*), in English law, is an officer whose duties are chiefly ministerial (for he has only a few trifling judicial duties). The office is of great antiquity. The sheriff was formerly chosen by the inhabitants, though probably requiring confirmation by the crown. But popular elections for that purpose were put an end to by a statute of 9 Ed. II., which enacted that in future the sheriffs should be assigned by the chancellor, treasurer, and

judges. Ever since that statute, the custom has been, and now is, for all the judges of the common-law courts, with the lord-chancellor, and chancellor of the exchequer, to meet in the court of exchequer at Westminster on the morrow of All Souls, and then and there propose three persons for each county to the crown. This is called the *pricking* of the sheriffs, and the crown afterward selects one of the three nominated, and appoints him to the office. A sheriff continues in office for one year only, and cannot be compelled to serve a second time. The office is not only gratuitous, but compulsory, for if the person appointed refuses, he is liable to indictment. In practice, county gentlemen of wealth are appointed. In the city of London, the sheriffs are appointed not by the crown, but by the citizens. The sheriff has important official duties in elections of members of parliament. He is, by his office, the first man in the county, and superior to any nobleman while he holds office. He has the duty of summoning the *posse comitatus*—i.e., all the people of the county—to assist him in the keeping of the queen's peace; and if any person above the age of fifteen, and under the degree of a peer, refuse to attend the sheriff after due warning, he incurs a fine or imprisonment. The chief legal duty which the sheriff discharges is that of executing, i.e., carrying out all the judgments and orders of the courts of law. It is he who seizes the goods of debtors or their persons, and puts them in prison. For this purpose he has a number of persons called bound-bailiffs (or, in popular dialect, *bumbailiffs*), who in practice do this invidious work, and give a bond to the sheriff to protect him against any mistake or irregularity on their part. The necessity of this bond is obvious, for the doctrine of law is, that the sheriff is personally responsible for every mistake or excess made or committed by the bailiffs in executing the writs or process of the court, and frequent actions are brought against him by indignant prisoners, or debtors whose persons or goods have been arrested; and the courts watch jealously the least infringement of personal rights caused by these bailiffs. Every sheriff has also an under-sheriff and deputy-sheriff, the latter being generally an attorney, who takes charge of the legal business.

SHERIFF, in Scotland, is a title given to three county officials, all appointed by the crown. The lord-lieutenant is "sheriff-principal," and as such, though he performs no duties, takes precedence in the county. The "sheriff-depute" discharged the duties of the office until recently, when the greater part of them devolved on the "sheriff-substitute." In Scotland the office of sheriff is still that of a local judge, and not merely ministerial, as in England. The institution of the office is very ancient, and the jurisdiction, both civil and criminal, was, and still is, very extensive. By the statute 20 George II. c. 43, the office was put on a better footing. The principal, or high sheriff, was debarred from performing any judicial duty, and it was enacted that none should be appointed to be a sheriff-depute but an advocate of at least three years' standing. The sheriff-depute is disqualified from acting as advocate in any cause originating in his county, though in other respects he is at full liberty to practise. He holds his office for life or good behavior. The same statute gave each sheriff-depute power to appoint a sheriff-substitute. The sheriff-substitute was at first appointed during the pleasure of the sheriff-depute, but he is now appointed by the crown, requires to be an advocate or solicitor of five years' standing, and holds office *ad vitam aut culpam*. Being bound to reside within his county or district, and prohibited from taking other employment, while the sheriff-depute usually attends the sittings of the court of session in Edinburgh, he, in practice, exercises the original jurisdiction attaching to the office. The civil jurisdiction of the sheriff extends to all personal actions on contract or obligations without limit, actions for rent, and other questions between landlord and tenant. In questions affecting real or heritable property, his jurisdiction is unlimited in amount when the object is to regulate possession; but when the validity of a title is in issue, he is limited to cases where the value is less than £1000, and where the parties consent. In these cases there is an appeal from the decision of the sheriff-substitute to that of the sheriff-depute. He has also a summary jurisdiction in small-debt cases where the amount in question is not above £12; and these cases are determined without written pleadings. The sheriff does not try civil causes with a jury. In criminal cases the sheriff has jurisdiction in all the minor offenses which do not infer death or banishment, and power to award any punishment not exceeding two years' imprisonment. He has also jurisdiction in cases of bankruptcy and insolvency to any amount. In small-debt actions, criminal and bankruptcy matters, there is no appeal from the sheriff-substitute to the sheriff-depute. The sheriff's jurisdiction excludes that of the justices of peace in riots. He has charge also of taking the precognitions in criminal cases. He revises the lists of electors, and returns the writs for the election of members of parliament; and this last is almost the only duty which he performs in common with the English sheriff. An idea of the multifarious duties performed by the Scotch sheriff may be gathered from the statement that he exercises, within a comparatively small district, the functions which in England are exercised by the commissioners in bankruptcy, county-court judges, the stipendiary magistrates, recorders, revising barristers, and coroners. The office of commissary (q.v.) has been amalgamated with that of sheriff. Recently, large additions have been made to the sheriff's jurisdiction, and other changes are in contemplation.

The office of sheriff is one of the few which may be traced back to the Saxon times,

and it appears originally to have been the same both in England and Scotland. The sheriff was (under the earl and next to the bishop) the chief man of the shire, and seems to have possessed unlimited jurisdiction to keep the peace; to have presided in all the courts; to have punished all crimes, and have redressed all civil wrongs. This extensive jurisdiction, gradually acquired at the cost of lesser local courts, has been gradually infringed upon, partly by the exercise of the royal prerogative, and partly by parliament. But in England it suffered more from the appointment to the office of men unfit to exercise judicial powers, and from the consequent usurpation of their functions by the supreme courts. The same causes operated in Scotland, though to a less extent. In England, they resulted in the almost entire abolition of the judicial functions of the sheriff. In Scotland, they resulted in his being deprived of the more important parts of the criminal jurisdiction, particularly of the power to punish by death; and in his civil jurisdiction being limited mainly to questions affecting movables. In both countries, the office was usually hereditary, which tended to a separation of the duties of the office into the honorary and the laborious—the former being performed by the principal sheriff, and the latter by the deputy. In Scotland, this separation was completed by the act of George II., which entirely separated the offices, by the transference of the power of appointing the deputy from the principal sheriff to the crown. In England, this complete separation has never become necessary, from the fact of the sheriff's power having been much more crippled than in Scotland. Indeed, in England, so purely honorary and ministerial has the office become, that it has been held by a female, and in Westmoreland, the office was hereditary down to 1849. The duty of enforcing the orders of the supreme courts, which now in England are a principal part of the duties of the sheriff, appears to have been engrafted on the office—probably on the theory that these orders were those of the king himself. In Scotland, the sheriff has never been called on to enforce any writs except those actually and not merely in name proceeding at the instance of the crown.

SHERIFF (*note*) in the United States, is an officer of the state and county, and not of the general government; he has no judicial functions unless power to assess damages in certain cases with the aid of a jury is considered as such; and he is almost invariably elected by popular vote. The deputies of a sheriff are responsible to him only while he remains responsible to the executive and the public (see **PUBLIC OFFICERS**). The duties and function of the sheriff in general much the same in this country as in England.

SHERIFF-CLERK, in Scotland, is the registrar of the sheriff's court, and as such has charge of the records of the court. He registers, and, when required by the proper party, issues the sheriff's judgments. He also conducts what correspondence may be required. He has important duties to perform in regulating the summary execution which is issued in Scotland against the debtors in bills of exchange, promissory notes, and bonds, without the necessity of any judicial suit.

SHERIFF-MOOR, a name given to several moors in Scotland on account of the "wapiuschaws" which used to be there held, under the superintendence of the sheriff. The only moor of this name which appears prominently in Scottish history is situated in Perthshire, on the northern slope of the Ochils, 2 m. n.e. of Dunblane, and was the site of the great battle between the adherents of the houses of Stuart and Hanover, Nov. 13, 1715. The former, who consisted of the northern clans under the earl of Seaforth, and the western clans under gen. Gordon, numbering about 9,000 in all, were on their march southward, under the leadership of the earl of Mar, to join the Jacobites who had risen in the n.w. of England, when they were met by the duke of Argyle at the head of 3,500 disciplined troops. After lying under arms all night, the Macdonalds, who formed the center and right of the Highland army, attacked the left of their opponents, and routed it so completely that the fugitives fled with all speed to Stirling, carrying the news that Argyle had been totally defeated. Argyle, however, with his dragoons had meantime driven the left of the Highlanders back for 2 m., when the right and center returned from the pursuit, and took him in rear; he then skillfully withdrew his men to a place of shelter, and remained facing his opponents till the evening, when he retired to Dunblane, and next day to Stirling. About 500 were slain on each side. As a mere battle, the victory lay with the Highlanders; but it was so little decisive, that it paralyzed the action of the Jacobites almost as effectually as a defeat would have done.

SHERLOCK, THOMAS, D.D., an English prelate, was the son of Dr. William Sherlock, dean of St. Paul's, and was born in London in 1678. He was educated at Eton and Catharine hall, Cambridge, where he took the degree of M.A. in 1701. In 1704 he obtained the mastership of the temple; in 1714 he became vice-chancellor of his college, taking the degree of D.D. in the same year; and in 1716 dean of Chichester. Eleven years later he was raised to the see of Bangor, was transferred to that of Salisbury in 1734, and in 1748 to that of London. He died in 1761. Sherlock was a strenuous tory, and supported the church-and-state politics of his day with a sort of dull dignity. He displayed a good deal of diplomatic skill in his different official positions, whence Bentley nicknamed him "cardinal Albroni;" his eloquence and learning were likewise of a very superior order, as may still be ascertained from his 4 vols. of *Sermons* (1755-76), which were highly praised in their day. Besides these sermons, he wrote a variety of controversial treatises and pamphlets, all of which are now wholly forgotten.

SHERLOCK, WILLIAM, D.D., 1641-1707; b. London; graduated at Cambridge and became rector of St. George's parish, London, 1669; was made a prebendary in St. Paul's, master of the temple, and rector of Therfield. After the revolution he was suspended for refusing the oath of allegiance to William and Mary, but afterward took it, defending himself by publishing the *Allegiance of the Two Sovereign Powers*, to which the replies were almost innumerable. In 1691 he became dean of St. Paul's.

SHERMAN, a co. in n.w. Kansas, having the state line of Colorado for its w. boundary; 1050 sq.m.; pop. '80, 13-11 of American birth. It is drained in the n.e. by the North and South fork of Sappa creek, and Beaver creek, affluents of the Republican river. Its surface consists of level, fertile plains.

SHERMAN, a co. in central Nebraska, drained by the Loup fork of the Platte river, and other streams; 576 sq.m.; pop. '80, 2,061-1600 of American birth. Its surface consists of vast rolling prairies, extremely fertile and adapted to stock-raising, the production of grain, and dairy products. Co. seat, Loup City.

SHERMAN, a city in n.e. Texas, in Grayson co., 64 m. n. of Dallas; pop. '75, 7,000. It is on the Texas and Pacific railroad at its junction with the Houston and Texas Central railroad; 12 m. s. of the Red river. It is regularly and substantially built, mostly of brick, has a court-house of brick and stone erected at a cost of \$80,000. It is the center of a large local trade, and exports cotton and hides. It contains 2 banks, with an aggregate capital of \$450,000, 3 newspapers, 8 churches, and is the seat of Austin college. The leading industries are the manufacture of iron, flour, tobacco, and soap.

SHERMAN, JOHN, 1613-85; b. England; graduated at Cambridge, 1633; came to Connecticut, 1634; preached there for several years, and became a magistrate, 1641; was minister at Watertown, Mass., 1647-85. He was distinguished as a mathematician, published several almanacs, and was a fellow of Harvard college, where he also lectured.

SHERMAN, JOHN, b. Ohio, 1823; brother of gen. W. T. Sherman; studied law; admitted to the bar in 1844, elected a member of the 34th, 35th, and 36th congresses. In 1860 he was again elected to the house of representatives, but was made senator from Ohio in the following year, and re-elected for the two following terms. On the accession of president Hayes, senator Sherman was appointed to a place in the cabinet as secretary of the treasury, in which position he had the satisfaction of superintending the resumption, by the government, of specie payments, Jan. 2, 1879, after a suspension of 17 years. In the exciting campaign for president in 1880, secretary Sherman was a prominent candidate for nomination by the republican party at the convention held at Chicago in June; but it becoming apparent that his nomination was impossible, owing to the formidable strength of the friends of gen. Grant, a combination was effected between the Sherman and Blaine parties in the convention, and the compromise pursued which resulted in the nomination of gen. Garfield. On Mar. 4, 1881, Mr. Sherman took his seat as U. S. senator from Ohio.

SHERMAN, ROGER, 1721-93; b. Mass.; a shoemaker, who in 1743 settled in Connecticut, where he was a store-keeper. He became county surveyor of lands in 1745; but taking up the study of law, was admitted to the bar in 1754. He served a number of terms in the assembly, became a judge of the court of common pleas in 1759, and was appointed to the same office 6 years later at New Haven, whither he had removed in 1761; and he held the office till 1789, part of the time sitting on the superior court. He was a member of congress from 1774 till his death, one of the committee of 5 appointed to draft the declaration of independence, a member of the boards of war and ordinance, and of several important committees. He helped codify the laws of Connecticut, and to draw the articles of confederation; was a member of the constitutional convention of 1787, U. S. senator, 1791-93, and mayor of New Haven from 1784 to his death. He was a man of strong practical sagacity.

SHERMAN, SIMEY, 1805-73; b. Mass.; lineally a descendant from Roger Sherman; received a common school education; established himself in business in New York, but removed thence to Cincinnati, Ohio, in 1831, and again to Newport, Ky. In 1835 he raised a company to aid Texas in her struggle for liberty and independence, equipping his men and supplying two pieces of artillery. He was engaged in the conclusive battle of San Jacinto, in which he commanded the left wing of the Texan force, and first raised the exciting battle-cry "Remember the Alamo!" In 1837 he removed to Texas, and five years later was sent to congress from Harris co., that state. He planted the first railroad on Texas soil in 1854. During the war of the rebellion he organized the defense of Galveston.

SHERMAN, THOMAS W., 1813-79; b. Rhode Island; graduated at West Point in 1836; commissioned 2d lieutenant in 3d artillery. He was engaged in the Mexican war, and was made brevet major for gallant conduct at the battle of Buena Vista. At the outbreak of the rebellion he was appointed lieutenant-col. of the 5th artillery, but in 1863 returned to the 3d artillery as its col. He was made brigadier-general of volunteers; commanded the land forces in the operations against Port Royal and the Sea islands in Oct., 1861; and in December of the same year occupied Beaufort and Tybee island. He was under

gen. Banks at Port Hudson in 1863, where he lost a leg. In 1870 he was placed on the retired list with the full rank of maj. gen. in the U. S. army.

SHERMAN, WILLIAM TECUMSEH, an American gen.; b. in Ohio in 1820; was educated for the army at the military academy of West Point, and received a commission as 1st lieut. in 1841. During the war with Mexico, he served in California, and was promoted to the rank of capt. In 1860, at the secession of the southern states, he was residing at New Orleans in a civil capacity, but went north, and at the commencement of the war offered his services to the federal government, was appointed col. of infantry, and was in the battle of Bull Run. Raised to the rank of brig. gen., he succeeded gen. Anderson in the department of Ohio, from which he was removed for deeming that it would require 200,000 men to hold Kentucky. He distinguished himself at the battle of Shiloh, and as maj. gen. in the siege of Vicksburg. Raised to an independent command, he marched across the state of Mississippi, and after the defeat of gen. Rosecrans, took command of the army in Georgia, forced gen. Hood to evacuate Atlanta, and then marched across the entire state, capturing Savannah and Charleston; from which point he moved on, capturing the most important confederate positions, and by cutting off the resources of gen. Lee, compelled the evacuation of Richmond, and the surrender of gen. Lee to gen. Grant, April 9, 1865. The surrender of the army of gen. Johnston to gen. Sherman in North Carolina a few days later, and that of gen. Kirby Smith, w. of the Mississippi, closed the war. No northern gen. has acquired greater popularity than Sherman. He divides with Lee and Stonewall Jackson the admiration of impartial foreigners. Sherman was appointed lieut. gen. in 1866; and, in 1869, became commander-in-chief. He has had ample justice done to the daring originality of design, the fertility of resource, brilliant strategy, and untiring energy that made Grant pronounce him "the best field-officer the war had produced." See *Memoirs of General William T. Sherman*, by himself; published in 1875.

SHERMAN, WILLIAM TECUMSEH, (*ante*), b. Ohio, 1820; graduated at West Point in 1840, and in the same year was appointed 2d lieut. of the 3d artillery. He was engaged in the Florida war, and in 1847 was sent to California, where he was acting ass't adjt. gen. until 1850. In 1853 he resigned from the army and entered the banking business in San Francisco, afterward removed to New York, practiced law for a time in Kansas and in 1858 was president of the Louisiana military academy. In 1861 he went to St. Louis, and was commissioned col. of the 13th regular infantry, and on May 17 brig. gen. of volunteers. He commanded a brigade at Bull Run (July 21); in October took command of the department of the Cumberland; and had charge of a camp of instruction at St. Louis, later and until February, 1862, when he was ordered to the command of the district of Paducah, Ky. He fought through the campaign in Mississippi and Tennessee, was wounded at Shiloh, and on May 1 was commissioned maj. gen. of volunteers. In December he made an unsuccessful attack on Vicksburg, and was with gen. Grant in the subsequent movement against that stronghold. After the fall of Vicksburg he was made a brig. gen. in the regular army. During the latter part of 1863 he was in Mississippi and Tennessee; commanded the left wing of the army at Chattanooga; and forced gen. Longstreet to raise the siege of Knoxville in December. After various movements of importance, including cutting the railroad lines centering at Meridian, Miss., he took command of the military division of the Mississippi in Mar., 1864, and concentrated and organized at Nashville an army comprising 100,000 men, with which he undertook his invasion of Georgia. He fought the confederates under gen. Joseph E. Johnston at Dalton, Resaca, Cassville, Dallas, and in the Kenesaw mountains, from May 12 to the beginning of July, when he occupied Marietta, and defeated gen. Hood, who had superseded Johnston, in several hard-fought battles, winding up his triumphant campaign Sept. 1, when Atlanta was evacuated after a siege of 40 days; on Aug. 12 he was commissioned m. j. gen. in the regular army. Gen. Sherman now rested his army until November, when he undertook the "march to the sea" which has chiefly perpetuated his fame. On Dec. 13 he was at Savannah, when he stormed fort McAllister and captured the city. Making the latter his base for future operations, he marched into South Carolina, capturing Columbia Feb. 17, 1865; Cheraw, Mar. 3; and, continuing into North Carolina, fought battles at Averysboro and Bentonville, and captured Goldsboro on Mar. 23. He took Raleigh April 13, and on the 26th received the surrender of gen. Joseph E. Johnston at Durham Station. He continued his march to Richmond and Washington, where it concluded May 24, having extended over 2,600 miles. He was appointed in June to the command of the military division of the Mississippi. On July 25, 1865, he succeeded gen. Grant as lieut. gen., and, on Grant becoming president, was made gen. of the army, a position which he still holds. In 1871 he made an extended tour through European and oriental countries, being everywhere received with distinction. He made his headquarters in Washington after his return, until 1874, when he removed to St. Louis. In 1875 he published *Memoirs of General W. T. Sherman*, by himself.

SHERRING, M. A., 1826-80; b. England; ordained in 1852; went to Benares, northern India, as a missionary of the London missionary society, 1853; was stationed at Mirzapore in 1856; returned to Benares in 1861, where he remained until his death. He

visited England in 1867 and 1876. He published, *The Indian Church during the Mutiny; The Sacred City of the Hindus; The Tribes and Castes of India as Represented in Benares; The History of Protestant Missions in India.*

SHERBY. See WINE.

SHERWIN, THOMAS, LL.D., 1799-1869; b. N. H.; graduated at Harvard college in 1825; was principal of an academy at Lexington, Mass., 1825-26; tutor at Harvard, 1826-27; spent several months in engineering and surveying; taught a private school for boys in Boston for a year; and afterward had charge of the Boston English high school; was one of the founders of the American institute of instruction in 1830. He published an *Elementary Treatise on Algebra; Common School Algebra.*

SHERWOOD, MARY MARTHA (BUTT), 1775-1851; b. England; educated by her father, the rev. George Butt. Her first book was published, against her wishes, when she was 17 years of age. She married capt. Henry Sherwood; resided in India, 1804-18, and afterward in England. She wrote 90 volumes, including stories for children, novels, and works of laborious research. Among the best known are: *Lenny and his Barer; Roxohi; and The Lady of the Manor.*

SHERWOOD FOREST, a stretch of hilly country in the w. of Nottinghamshire, lying between Nottingham and Worksop, and extending at out 25 m. from n. to s., and 6 to 8 m. from e. to west. It was formerly a royal forest, and the traditional scene of many of the exploits of the famous Robin Hood and his followers; but it is now almost wholly disafforested, and is occupied by gentlemen's seats and fine parks. The town of Mansfield and a number of villages are situated within the ancient bounds. Numerous remains of the old forest are still to be seen. The soil, which is principally a species of quartzose gravel, is in some places fertile, in others almost barren, and on the whole but of moderate quality.

SHELT LAND, ZETLAND, or anciently HIALTLAND, and likely the ultima thule of the Romans, a group of about 100 islands, islets, and rocks, 23 of which are inhabited. They lie between the Atlantic and the North sea, between lats. 59° 51' and 60° 50' n., and between longs. 0° 53' and 1° 15' w.; but Fair Isle, which belongs to Shetland, lies to the s., and is about midway between Orkney and Shetland. The group is about 25 leagues n.e. of Orkney, and 44 w. of Norway. Area, 325 sq. miles. There are three chief islands, the largest or Main-land, 60 m. long by 3 to 10 broad; Yell, 20 by 6 m.; and Unst, 11 by 6 miles. Pop. in 1811, 22,379, and in 1871, 31,008, with 141.2 females to every 100 males, and 5,667 inhabited houses. In 1871, 67 per cent of the children between the ages of 5 and 13 were receiving education. In 1869 only 4.7 per cent of the births were illegitimate. Lerwick, 272 m. n. of Edinburgh, and 95 n. of Wick, is the only town in Shetland, and has a custom-house, law courts, and other public offices, and about 70 shops. Its pop. in 1871 was 3,516. It has a fine natural harbor, and has steam communication with Granton bi-weekly in summer, and weekly in winter, for passengers, mails, and a large part of the exports from and imports into Shetland. Fort Charlotte, now used as a prison, court-house, etc., is at the n. end of the town, and adds to its picturesqueness. Lerwick has two hotels, two licensed public-houses, and several lodging-houses. The chief imports are oatmeal, flour, tea, tobacco, spirits, sugar, cottons, woolens, timber (chiefly from Norway), tar, salt, etc. From £15,000 to £20,000 worth of bread-stuff is imported annually to supply the deficiency of native grain. All classes consume much tea. No wood grows in the country. In 1875, 244 vessels of 89,605 tons entered, and 214 of 37,116 tons cleared the port of Lerwick. Scalloway and Hillswick are the largest villages. The chief exports are dried salted fish, about 3,000 tons annually, about a half to Spain; herrings, 4,000 to 10,000 barrels in the year; about 2,160 cattle and 600 ponies yearly; about 12,000 sheep in 1873; eggs, of which 54,000 have left in one steamer; hand-knitted woolens of great beauty and fineness of workmanship; fish oil; chromate of iron from Unst; copper ore from Sandilodge; iron pyrites formerly from Fitful when sulphur was dear. The exports exceed in value £100,000 annually.

Fishing for cod, ling, herring, is the chief industry, but each fisherman has usually a small farm at £4 or £5 yearly rent, and mostly worked by the females of his family. In 1876 Shetland had 614 fishing-boats, with 2,772 fishermen and boys. Almost all the small tenants practice spade cultivation. Seals and bottle-nosed whales are often caught. Nearly every house has a quern or hand-mill, and every township has one or more of the old Norse water-mills. The spinning-wheel is common, but the spindle is still in use in some parts. Carts are rare, and in many districts unknown. The sheep and ponies run at large on the scattfield or common, and have registered marks; but many large tracts have been inclosed and drained, and now rear first-class cheviot and black-faced sheep. The *riplin*, a sandal of untanned leather, is still worn. Some lands are still held runrig, and some islanders on the w. still hold their stock as steel-bow. In certain districts, till a very late period, the poor, by the Norse law, went from house to house, and stayed a longer or shorter period in each, according to the size of the farm. The Shetland dialect is a soft and pleasant English, but contains many peculiar Norse words. Many of the people still eat their fish wind-dried and slightly tainted. Young men from Shetland are employed as sailors in the Peterhead and Dundee whalers, or at

some of the large shipping ports of the kingdom. They are intelligent, sober, and sedate, and are much liked as seamen. Shetland is still subjected to the *truck* or barter system in local commercial transactions.

Shetland had a parliamentary constituency of 358 in 1875-76, and with Orkney forms a county, which sends one member to parliament. In 1876 Shetland had 5,772 horses, 21,050 cattle, 87,925 sheep, and 4,663 pigs; 10,859 acres in oats and barley, the only grain crops; and 618 acres in turnips. The native cattle, sheep, and horses (shelties or ponies) are small. The valued rent in 1877-78 was £36,695. Free landed property is termed *udal*, and the proprietor an *udaler*. Shetland has 14 civil parishes, with 23 established churches, and 9 free.

The surface is rugged and wild, and often sterile. The coasts are abrupt, and cut with deep bays or *voes*, and caves. The rocks are mainly gneiss, clay-slate, sand-stone, granite, sienite, mica-slate, serpentine, and diallage. The highest hills are *Romas*, 1500 ft., and one of five in *Foula*, 1400. The coast cliff scenery is very fine, and none in Scotland surpasses that about *Papa Stour*. The climate is moist and variable. South-w., s., and n. winds prevail. The mean temperature for the year is 45°, for Jan. 39°, and for July 53°, winter being warmer, and summer cooler than in the s. of Scotland. The mean annual rainfall at *Bressay* is 38 in., and at *East Yell*, 50. The tide flows an hour earlier on the w. than on the e. side of Shetland. The prevailing diseases are dyspepsia, rheumatism, and catarrh. Infant mortality is not high. Idiocy and imbecility are frequent. Fair hair and blue eyes are very common.

Though we know little or nothing of the original inhabitants of Shetland, the physiognomy, character, and language of the present point to a Norse or Scandinavian descent. In *Unst*, etc., have been found cairns over long and short stone collins, with skeletons, clay urns, weapons, and stone vessels. Tumuli and burned stones and earth are frequent, and contain remains of rude buildings and stone implements. Circular strongholds of unhewn stone, called *burghs* or "*broughs*," are very numerous, generally on a cliff or headland, but also on artificial islands in fresh-water lochs. *Mouise* isle has the most perfect "*brough*" known. In *Sandsting* occur very rude underground houses, with the rudest stone implements. In *Bressay* was found a stone of the Christian period, with an *Ogham* inscription. Monoliths are rather frequent. Stone circles are rare, and never large.

SHEW-BREAD, "bread of the presence," in the Jewish ritual; 12 loaves of unleavened bread, sprinkled with frankincense and placed in the "holy place," on a table of acacia wood overlaid with gold. They were exchanged for fresh loaves every Sabbath, and, after the incense on them had been burned as an oblation, were eaten by the priests. Yet in extreme cases they might be given to hungry men. Wine was placed on the table with the bread.

SHIAHS, or SHEERANS. See **SHIITES**.

SHIAWAS'SEE, a co. of s.e. Mich., intersected by the Shiawassee river, drained also by the Looking-Glass and Maple rivers, and intersected by the Detroit and Milwaukee, and Jackson, Lansing and Saginaw railroads: 550 sq.m.; pop. '80, 27,059. Its surface is undulating, and extensively covered with forests of oak, ash, beech, and sugar-maple. Soil sandy but fertile, producing wheat, maize, oats, and hay.

SHIB BOLETH (Heb. ear of corn, or stream), the test-word used by the Gileadites, under Jephthah, after their victory over the Ephraimites, recorded in Judges xii. 6. It appears that the latter could not pronounce the *sh*, and, by saying sibboleth, betrayed themselves, and were slaughtered mercilessly. It may be noticed that all those Hebrew names in the Old Testament which commence with the *sh*, have now, through the inability of the Septuagint to render this sound in Greek, become familiar to us through the versions that flowed from it, as beginning with the simple *s*, e.g., *Sem*, *Simon*, *Samaria*, *Solomon*, *Saul*, etc. The word sibboleth is used in modern languages in the sense indicated: viz., a test of speech and manners of a certain party or class of society.

SHIDZUOKA, a city in Suruga province, Japan, formerly called *Sumpu* or *Fuchiu*, noted even in mediæval times. *Iyéyasu*, the great unifier of Japan, made it the capital of his tief, and after establishing his family in *Yedo*, made it the seat of his labors for the revival of literature and the arts of peace, 1604-16, during which time many Europeans visited the city and described it in their works. In 1868 the tycoon and his followers were ordered to make this city, their former ancestral home, their abiding place, its name *Fuchiu* being changed to *Shidzuoka*, which means Peaceful Slope. The surrounding region is the richest tea-district in Japan. Inlaid lacquer-work and split ware are largely manufactured. Looming before the city is the sacred *Fujiyama*. Six miles distant is the famed *Kuno San*, and the sea-port of *Shimidzu*. Christian churches and flourishing schools on the American plan attest the influence of the teachers from the United States who have resided there.

SHIEL, Loch, in the w. of Scotland, forms part of the boundary between the counties of Argyll and Inverness, separating the district of *Moidart* on the n. from those of *Sanart* and *Ardgower* on the south. The head of the loch is about 16 m. w. of *Fort William*. It is 15 m. long, and about 1 m. broad, and communicates with the sea by *Shiel Water* and loch *Moidart*.

SHIELD, a piece of defensive armor, borne on the left arm, to ward off the strokes of the sword and of missiles. It has been constantly used from ancient times through the middle ages, till the invention of fire-arms rendered it useless. The large shield worn by the Greeks and Romans (Gr. *aspis*, Lat. *clipeus*) was circular, and often ornamented with devices. Another form of shield (Lat. *scutum*) was used by the Roman heavy-armed infantry, square, but bent to encircle the body. The early shield or knightly escutcheon of the middle ages was circular in outline, and convex, with a boss in the center; the body generally of wood, and the rim of metal. In the 11th c., a form came into use which has been compared to a boy's kite, and is said, with some probability, to have been brought by the Normans from Sicily. It was on the shields of this shape that armorial designs were first represented. These shields were in reality curved like the Roman *scutum*; but after heraldry began to be systematized, we generally find them represented on seals, monuments, etc., as flattened, in order to let the whole armorial design be seen. In the 13th c., this long and tapering form began to give place to a pear-shape, and a triangular or heater-shape. During the 14th c., these new forms became more generally prevalent, and the heater-shape, which was perhaps most frequently represented on armorial seals, began to approach more to an inverted equilateral arch. The same variety of forms, with some modifications, continued during the 15th c., a tendency appearing in all representations of the heater-shaped shield to give it more breadth below. A notch was often taken out in the dexter chief for the reception of the lance, in which case the shield was said to be *à bouche*. Subsequent to the middle of the 14th c., when the shield came to be depicted as surmounted by the helmet and crest, the shield is often represented *couché*, that is, pendent from the corner, an arrangement said to have originated in the practice of competitors hanging up their shields prior to a tournament, where, according to De la Colombière, if they were to fight on horseback, they suspended it by the sinister chief, and if on foot, by the dexter chief. A square shield denoted a knight-banneret. Shields of arms were often represented as suspended from the *guige*, or shield belt, which was worn by the knights to sustain the shield, and secure it to their persons.

After the introduction of fire-arms made shields no longer a part of the warrior's actual equipment, the form of the shields on which armorial bearings were depicted, on seals, monuments, brasses, etc., varied greatly in form, and generally speaking, became gradually more tasteless, fanciful, and unmeaning. A tendency has, however, been shown in recent heraldry to recur to the artistic forms prevalent in the 14th and 15th centuries.

In early times, shields of the form which generally prevailed at the period were exhibited on the seals and monuments of ladies; but about the 15th c., the practice began, which afterward became usual, of unmarried ladies and widows (the sovereign excepted) bearing their arms on a lozenge instead of a shield.

The heraldic insignia of towns, corporations, etc., as well as individuals, are placed on shields. The bearing of merchants' marks (q.v.) in a shield was prohibited by the heralds of the 16th c. under severe penalties, and yet not a few instances are to be found on monumental brasses of these devices being placed on shields.

SHIELDS, CHARLES WOODRUFF, D.D., b. Ind. 1823; graduated at the college of New Jersey, 1844, and at Princeton seminary, 1847; pastor of First Presbyterian church, Hempstead, L. I., 1849-50; and of the Second Presbyterian church, Philadelphia, 1850-65; professor of the relations of religion and science in the college of New Jersey from 1865 to the present time (1881). He has edited *The Book of Common Prayer, as amended by the Westminster Divines*; and is author of *Philosophia Ultima*, a work of extensive scope and deep reasoning.

SHIELDS, JAMES, 1810-79; b. Ireland; came to this country in 1826; practiced law at Kaskaskia, Ill., 1832; member of the legislature, 1836; state auditor, 1839; judge of the supreme court, 1843; commissioner of the general land office, 1845. He served in the Florida war and in Mexico; brevetted for gallantry at Cerro Gordo, and Chapultepec; severely wounded at both places. He was governor of the territory of Oregon, 1848; U. S. senator from Illinois, 1849-55; removed to Minnesota and was senator from that state, 1858-60. From there he went to California, returned during the war, and took command of gen. Lander's division at his death; was wounded at the battle of Winchester. He was appointed U. S. senator from Missouri in 1879 to fill out the unexpired term of David H. Armstrong.

SHIELDS, NORTH, a municipal corporation and seaport of Northumberland, on the n. bank of the Tyne, and at the mouth of that river, opposite South Shields, and 8 m. e.n.e. of Newcastle. It stretches more than a mile along the river-bank, and is rapidly extending westward. Possessing all the usual institutions, as churches, schools, theater, custom-house, sailors' home, etc., it is not distinguished by any striking architectural features, and it is indebted to its rising trade and manufactures for its importance. There are numerous collieries in the vicinity, and the Northumberland docks, which are within the borough, export more than a million tons a year. The resident ship-owners of North and South Shields possess together upward of 200,000 tons of shipping. The harbor is bordered with quays, and is spacious enough to accommodate 2,000 vessels of 500 tons each. The building of wood and iron vessels, and tug-steamers, the manufac-

ture of anchors, chain-cables, ropes, blocks, masts, and other articles of ship-furniture, are the principal branches of industry. North Shields has an extensive public free library and news-room. It sends one member to parliament. There is a school-board, and it further possesses a time-gun, which is fired daily at one o'clock in the afternoon. Pop. '71, 38,969.

SHIELDS. SOUTH, a custom-house port, municipal and parliamentary borough, and market-t., of Durham, on the s. bank of the Tyne, and at the mouth of that river, 9 m. e.n.e. of Newcastle by river and railway. The town stretches for 2 m. along the side of Shields harbor, which is lined with numerous dockyards and manufactories. The Tyne dock, containing 50 acres of water space, in which upward of a million tons of coal are annually shipped, and a large import trade is carried on, is within the borough. The market-place is a spacious square in the center of the town, near which is the large church of St. Hilda. The town, with North Shields, is one of the chief ports in the kingdom for the building of iron ships, iron screw-steamers, and tug-steamers. There are large alkali, bottle, and glass works, and every kind of manufacture connected with shipping. A steam-ferry for passengers and carriages plies day and night between the two towns, one on the n., and the other on the s. side of the entrance to the Tyne. Shields bar has been removed by dredging, in order, with the piers, to form a harbor of refuge. The sea-coast, in the neighborhood, is interesting from the rocks and caves. The life-boat is a South Shields invention. South Shields sends one member to parliament. South Shields possesses a large public library, with news-room, and large hall for public meetings. There is an extensive colliery, that of St. Hilda's; a school board; and Tyne pilotage board, comprising representatives of North Shields, South Shields, and Newcastle. A large new theater has recently been erected. Pop. '61, 25,239; '71, 44,722.

SHIITES ("sectaries," from the Arab. *shiah*, *shiat*, a party, a faction), the name given to a Mohammedan sect by the "Sunrites" (q.v.), or orthodox Moslems. The Shiites call themselves "followers of Ali," and have special observances, ceremonies, and rites, as well as particular dogmas of their own. The principal difference between the two consists in the belief of the Shiites that the imam, or supreme rule, both spiritual and secular, over all Mohammedans, was originally vested in Ali Ibn Abi Taleb, and has been inherited by his descendants, to whom it legitimately now belongs. The Persians are Shiites; the Turks, on the other hand, are Sunrites; and this division between the two nations dates chiefly from the caliphate of Mothi Lilla, the Alas-side, in 363 H., when political dissensions, which ended in the destruction of Bagdad and the loss of the caliphate of the Moslems, assumed the character of a religious war. The Shiites themselves never assume that (derogatory) name, but call themselves *Ab-Adeliat*, "Sect of the Just Ones." They are subdivided again into five sects, to one of which, that of Haidar, the Persians belong; the present dynasty of Persia deriving its descent from Haidar, a descendant of Ali. Ali himself is by some of them endowed with more than human attributes. The Shiites believe in metempsychosis and the descent of God upon his creatures, inasmuch as he, omnipresent, sometimes appears in some individual person, such as their imams. Their five subdivisions they liken unto five trees, with seventy branches; for their minor divisions of opinions, on matters of comparatively unimportant points of dogma, are endless. Yet in this they all agree, that they consider the caliphs Abu Bekr, Omar, and Othman, who are regarded with the highest reverence by the orthodox Sunrites, as unrighteous pretenders and usurpers of the sovereign power, which properly ought to have gone to Ali direct from the prophet. For the same reason they abominate the memory of the Ommayyad caliphs, who executed Husain, a son of Ali, and they still mourn his death at its anniversary. They likewise reject the Abasside caliphs, notwithstanding their descent from Mohammed, because they did not belong to Ali's line.

SHIKARPUR, the most important trading t., and probably the most populous t., in Sind, stands about 20 m. w. of the Indus, half way between Multan and Kurrachi. The district in which it stands is so low and level that, by means of canals, which are supplied from the Indus, it is flooded every season. Its climate, notwithstanding, is said to be not unhealthy. The inundated quarters are extremely fertile and produce great crops. Groves, orchards, and fruit-gardens surround the town; sugar cane is largely grown. Shikarpur is situated on one of the great routes by the Bolan pass from Sind to Afghanistan, and the transit trade to that country and to Khorassan is important. The bankers and financiers of Shikarpur are known and trusted from Astrakhan to Calcutta. Shikarpur is the chief town of the district of the same name, which has an area of 8,813 sq. m. and 776,227 inhabitants. Pop. of the town, '72, 38,107, about 20,000 of whom are Hindus, and the rest chiefly Mohammedans.

SHILKA. See AMOOR.

SHILLABER. BENJAMIN P., b. N. H. 1814; was a printer at Dover, N. H., in 1830, and in 1835 went to Demerara, Guiana, as a compositor, and remained there three years. From 1840 to 1847 he was in the printing office of the Boston *Post*, and after that time for three years was connected with the same paper editorially. It was at this period that he wrote over the name "Mrs. Partington" and gained a reputation as a

humorist by the quaintness of his style and matter. Between 1850 and 1852 he tried his hand at newspaper proprietorship, in the *Pathfinder* and *Carpet-Bag*, but returned to the *Post*, 1853-56. From 1853 he was for ten years one of the editors of the Boston *Saturday Evening Gazette*. He has published *Rhymes with Reason and Without*; *Poems*; *Life and Sayings of Mrs. Portington*; *Knitting-Work*, and other volumes.

SHILLING, the name of a money in use throughout many European states, partly as a coin and partly as a money of account. In all probability the name, as well as the thing itself, is derived from the Roman *solidus*, which, with other remains of Roman institutions, was adopted by the Franks and other Germanic nations. See **PENNY**, **SOLIDUS**. Others give more fanciful derivations, as from *schellan*, to ring, on account of the particularly clear ring of the coin, and from St. Killian, whose effigy was stamped on the shillings of Würzburg. The *solidus-shilling* of the middle ages has suffered various degrees of diminution in the different countries. Thus the English silver shilling is $\frac{1}{20}$ of a pound sterling; the Danish copper one is $\frac{1}{16}$ of a ryks-daler, and = $\frac{1}{4}$ d. sterling; and the Swedish shilling is $\frac{1}{16}$ of a ryks-daler, = $\frac{1}{4}$ d. sterling. In Mecklenburg, Sleswick-Holstein, Hamburg, and Lübeck the shilling is used as a fractional money of account (the $\frac{1}{16}$ of a mark, $\frac{1}{16}$ of a thaler), and as small silver change (each coin being a shade less in value than $\frac{1}{4}$ d. sterling). The French *sou* is another representative of the *solidus*. See **POUND**, **MINT**.

SHILOH, a city of Ephraim, on a hill n. of Bethel and e. of the great northern road; the abode of the tabernacle and ark from the conquest to the death of Eli, after which it sank into insignificance, and is several times spoken of in Scripture as having been visited with judgments from God because of the iniquities committed there while it was the place consecrated to his worship. Dr. Robinson identified it with Seilun, a city surrounded with hills, where he found the ruins of an old tower with large stones and broken columns.

SHILOH, BATTLE OF. So named from a church situated where the battle was fought, near Pittsburgh landing, Hardin co., Tenn., on the Tennessee river, April 6-7, 1862. Gen. Grant, who was in command of the union force, had about 32,000 men; and gen. Albert Sidney Johnston, with about 50,000 confederates, marched up from Corinth and attacked on the morning of the 6th with his entire force, driving the federals toward the landing. Gens. W. T. Sherman and Prentiss suffered greatly in this attack, the latter losing three entire regiments. Gen. Johnston was killed by a rifle-ball on this the first day of the fight, and the command fell to gen. Beauregard, who continued vigorously the attack, directing it mainly toward the center and left of the union army. This portion of the line of defense being protected by a heavy concentrated fire of artillery, and covered by two gun-boats in the river, the attack was repulsed, and the confederate line fell under such heavy fire at night that it was forced to retire. In the mean time gen. Buell had come up with reinforcements to the extent of about 13,000 men, and these crossed the river during the night. The battle was reopened on the morning of the 7th by a heavy artillery fire from the union batteries, and on the confederates falling back, an assault was made and a general engagement ensued, which continued with great fierceness until late in the afternoon, when the confederates finally retired discomfited. The union loss was 1700 killed, 7,495 wounded, 3,023 prisoners; total, 12,217. Confederate loss: 1728 killed, 8,012 wounded, 959 missing; total, 10,699.

SHIMONOSEKI, a t. of Japan, in 23° 56' n. lat., and 131° e. long., at the s.w. extremity of the island of Nipon, and at the entrance of the inland sea Suonada. It is surrounded by hills, and consists of one main street, containing about 10,000 inhabitants. The warehouses—the principal buildings—are built of mud and wood, coated with cement, and are said to be fireproof. Simonoseki is a depot for receiving the European imports from Nagasaki, to be sent into the interior of the country; also for the produce from Osaka, which is reshipped to Nagasaki and other places.

SHIMONOSEKI, a sea-port city of Japan, at the extreme s. end of the province of Naga'o (Choshu), commanding the narrow straits of the same name; lat. 33° 56' n. long. 131° e.; pop. 75,19,532. It is the terminus of the great high road that traverses the entire main island, and the entrepot of a bustling junk and steamer trade. It is surrounded by high hills. In 1185 the naval battle, in which 1200 war junks were engaged and the Taira army was annihilated by the Minamotos, was fought off the town. In 1864 the daimio of Choshu and his retainers erected forts on the bluffs, and refused to allow foreign vessels to pass through the straits—a place where they had no legal right to be, the laws of nations guaranteeing to every country the right to all its territory "to the distance of a marine league along all its coasts," (see *Wheaton, passim*). The strait of Shimonoseki at the narrowest portion is but half a mile wide. The mikado commanded the Choshu clan to close the strait. Foreign vessels were first warned off and then fired on. By the instigation of sir Rutherford Alcock, another expedition consisting of five British, four Dutch, and three French ships, with the small chartered steamer *Takling*, having on board a gun and a party from the *Jamesstown*, representing the United States, arrived Sept. 4 off the batteries, and began the bombardment on the 5th, continuing it for 3 days, when the silenced forts were entered and dismantled. The allied powers demanded from Japan the sum of \$420,000 for injuries and expenses,

and an "indemnity" of \$3,000,000, of which \$750,000 was paid to the United States, and \$10,000 to the American owners of the ship *Pembroke*, fired on by the batteries, but unhurt. The total expenses incurred in the expedition by the United States government was less than \$25,000 (see *MIKADO'S EMPIRE*, p. 593). The "Shimonoseki Indemnity Fund," still lies in the U. S. treasury, amounting by accumulation of interest to about \$1,500,000. The many attempts to have the money returned, thus iniquitously extorted from Japan have thus far failed. It is to be hoped that this justice will not be long delayed.

SHIN, Loch, in the s. of Sutherlandshire, measures 18 m. by 1 mile. The Shin water, a famous trout-stream, carries the waters of the loch into Oikell water. Loch Shin abounds in trout and salmon.

SHINDLER, MARY S. B. (PALMER), b. S. C. 1810; educated in northern seminaries; became a Unitarian and afterward an Episcopalian. She published several volumes of poems and novels, among which were, *The Southern Harp*; *The Northern Harp*; *Charles Morton*, or *The Young Patriot*.

SHINER, the name of a small fish, the *stilbins Americanus*; applied also to other species of the cyprinidae family. The shiner is usually but 3 or 4 in. long, resembles the bream, is found abundantly in the United States, but is not edible.

SHING-KING, or LEAOTONG. See MANTCHURIA, *ante*.

SHINGLES (probably derived from Lat. *cingulum*, a belt) is the popular name for the variety of *herpes* (q.v.) which is known as *H. zoster*.

SHINGLES, that pieces of wood used in roofing like slates or tiles. Such roofs are much used in newly-settled countries where timber is plentiful. The wood is chosen from among the kinds which split readily and straightly, and is usually some kind of fir. It is cut into blocks, the longitudinal faces of which are of the size intended for the shingles, which are then regularly split off in thicknesses of about an quarter of an inch.

SHINTOISM, or SHINTUISM. See JAPAN, *ante*.

SHIP (Ger. *Schiff* = *skiff*; from the root *skap-* or *skaph-*, to scoop, dig; Gr. *skaphe*, a trough, a boat) is a term applied with great vagueness to all large vessels; while under *shipping* would be included vessels of all sizes, excepting boats without decks. Among seamen, the expression is said to be limited to vessels carrying three masts, with a royal-mast surmounting each; but the development of steam-navigation, in which the largest vessels have sometimes only a schooner rig, must have gone far toward obliterating this distinction.

SHIP-BROKER—INSURANCE BROKER. A ship-broker is a person employed in the buying and selling and freighting of ships. His duties include adjusting the terms of charter parties and bills of lading, settling with the master for his salary, collecting freights on goods brought into port, arranging with passengers for the terms of their passage, and generally managing all business transactions occurring between ship-owners and the shippers or consignees of goods. The charges made by ship-brokers are generally about two per cent on their gross receipts. Ship-brokers have been ruled not to be within the acts for the regulation and admission of brokers.

The business of an *insurance broker* is usually combined with that of a ship-broker. Marine insurance is in Great Britain to a large extent transacted by brokers. Those who insure are in most cases capitalists, who are known to the broker as persons prepared to undergo any risks which he recommends to them. The broker, who has a list of persons ready at a moment's notice to underwrite a policy, is the mutual agent for both parties. He procures the subscriptions of the underwriters, arranging with them the rate of premium and conditions of the risk, receiving from them the amount of their respective subscriptions, in the event of loss; and, when such loss is partial, arranging the proportion to be recovered from the different underwriters. An insurance broker charges as profit five per cent on the premium, and one-half per cent deducted from all claims recovered from the underwriters. An insurance broker is personally liable to the underwriters for the amount of the premium, but incurs no liability to make good the amount insured to the owner of the ship and goods, who, in case of loss, must look to the underwriter alone for indemnification.

SHIP-BUILDING. See NAVIGATION; NAVIES, ANCIENT AND MODERN; and NAVY, BRITISH. From crossing a river or lake on a floating log, or on two or more logs fastened together raft-wise, the first steps toward ship-building were probably canoes (q.v.) and coracles (q.v.). The earliest Egyptian drawings show boats constructed of sawn planks, and having sails as well as numerous oars. So far as can be learned from ancient sculptures, the galleys of the Mediterranean at the dawn of civilization appear to have been open, at least in the middle portion; to have been built with keel, ribs, and planking, and to have been strengthened cross-wise by the numerous benches on which the rowers sat. Ships continued, however, to be generally of small draught, for they were beached every winter; and Cæsar mentions, as a noteworthy circumstance, that some of the long ships with which he invaded Britain could only approach the shore to such a point that the soldiers in disembarking were breast-high in water. The Romans

built their vessels of pine, cedar, and other light woods; but their ships of war were of oak at the bows, clamped strongly with iron or brass, for use as rams—a custom now curiously revived after 2,000 years of disuse. According to Caesar, the Veneti first built entirely of oak. The speedy oxidation of iron bolts and fastenings led to their super-session by copper and brass about the time of Nero. Before this time, the planks had been calked with flax, and the seams had been pitched. There is evidence to show that in Trajan's reign sheathing of lead fastened on with copper nails had been used as a protection for the timbers from the devastating insects of the Mediterranean. With the decline of Roman greatness came a new era for ship-building. The hardy Norsemen had chopping seas and Atlantic swells to fight with; their ships differed much from the stately galleys and quinqueremes of the empire. Far smaller, they were built more stoutly, with bluff bows, and a lug-sail which could be braced well up to the wind. The Norse ships must have been of considerable power, for there is good evidence that they had visited the coasts of the new world at an early period. We have, however, very little knowledge of the construction of these vessels, except that they had high prows and sterns to resist the waves, and that they were calculated for sailing in opposition to the galleys, which were for rowing. The introduction of galleys by Alfred, pulled by 40 and 60 oars, and twice as long, deep, nimble, and steady as the Danish ships, keep the latter in check; but it also checked the development of ocean-navigation, for the galleys were only fit for shore-service. The ships gradually increased in size. Harrikanute had a galley pulled by 80 oars; and contemporaneously, the Venetians are said to have built ships of 1200 to 2,000 tons. William invaded England in miserably small sailing vessels; but large—indeed very large—vessels appeared to have existed in the time of Richard I. John systematized ship-building by establishing a royal dock-yard at Portsmouth. Large ships constructed for sailing only seem to have come into general use, together with the mariner's compass, in the beginning of the 14th century. One hundred and fifty years later, the addition of the bowsprit added much to the sailing-powers of vessels.

In Ellis's collection of letters there is one, dated 1419 from John Alcêtre to king Henry V., concerning a ship building at Bayonne for that monarch. This letter is curious, as showing how many of the present terms then existed, and also that the "*Kynges schyppes*" were of considerable dimensions (e.g., "the stamme is in hithe 96 fete; and the post 48 fete; and kele ys yn leynthe 112 fete"). Before this period, ships had been built strong enough to encounter ice in the whale-fishery. From this period the history of ship-building is resolved into the history of individual parts, for the main principles of wooden ships were already established. In Henry VII.'s reign, the cumbersome fourth mast began to be dispensed with; in that of his successors, shifting top-masts came into fashion, the lofty stems and sterns (which must have precluded sailing on a wind) fell gradually into disuse. Port-holes were invented at least as early as 1500. In 1567, there were cutter-rigged vessels in the British seas. In the century ensuing, naval architecture was much improved by Mr. Phineas Pett, his son Peter, and by sir Anthony Deane; but the best naval architects were not in England. Within the present century, the introduction of steam has led to the building of ships with finer lines, both for bow and stern. About 1826, iron was introduced as a material for ship-building, and has now (1878) so far superseded wood, that, taking steamers and sailing ships together, 10 iron vessels are built for 1 wooden one.

Adverting now to the actual art and practice of ship-building, the subject is divisible into two distinct portions—the theoretical, known as *naval architecture*; and the practical, called *ship-building*. The naval architect designs the form of a ship with reference to the objects intended in her construction, to the speed required, powers of stowage, etc.; while the ship-builder works from his drawings, and gives practical effect to the theoretical designs.

Naval architecture on a theoretic basis is of recent date, for, as in all cases, practical efforts, more or less in the dark, have preceded by many ages the theorems of the man of science; nor is it at present by any means an exact science: some most successful ships have been but happy experiments. Our present knowledge of naval architecture we owe mostly to the researches of such men as the late prof. Rankine, Mr. Scott Russell, Mr. Froude, and others. All ships have to possess certain qualities, the principal of which are buoyancy, stability, handiness, and speed; but it is not possible for any ship to possess at the same time the maximum of all these, as to some extent they neutralize each other. The skill of the naval architect is shown in duly proportioning them to one another, ascertaining which are the more important in each particular case, and providing these without unduly impairing the others. In some vessels, it is essential that the greatest possible speed should be attained; while, as they are to work only in smooth water, their degree of stability (or freedom from excessive rolling, and tendency to right themselves when heeled over by a wave) is only secondary. In others, which have to weather long-continued storms in mid-ocean, speed may have to be sacrificed to attain greater steadiness. In sailing-vessels, where the means of propulsion is not under control of the crew as in steamers, handiness—the property of answering quickly to their helms, and of readily performing various manœuvres (such as tacking) under all conditions of weather—is often the quality to which most attention has to be paid. Along with all these things, the ship has to be made so as to have the largest possible amount of cargo.

or passenger space consistent with the proper degree of buoyancy. The degree in which a ship possesses the various qualities named depends chiefly upon her external form and dimensions, about which the following general statements may be given:

An increase of length gives an increase of displacement of water, and therefore of carrying power; if this be not desired, it allows of finer lines forward and aft, and consequently greater speed. It also increases the resistance to lee-way. The greater friction of the water on the longer sides does not appear to be material. Against the increase is to be set a diminished power of turning, tacking, and wearing. It also involves a more careful balancing of weights in the fore and after portions of the ship, for the moment of inertia of a small weight may become large in a long vessel, from being such weight multiplied into the square of its distance from the ship's center of gravity.

The increase of breadth gives greater stability to the ship, and by allowing of more sail, indirectly greater speed; but directly, it increases the resistance to the water. Of course, greater breadth enables greater bulk to be carried. Depth is a question dependent on the seas to be navigated, the object for which the ship is intended, and many other reasons. It is to be borne always in mind that the consumption of stores on a long voyage will change the draught of a ship considerably. Practice has proved unequivocally that ships sail better for drawing more water aft than forward.

Passing now to the actual designing of vessels: the architect works on paper only; he has therefore to show on a flat surface, for the builder's guidance, the exact position, curvature, and relief of every line and point in his proposed structure. He accordingly draws three plans, on each of which every point of the ship is traceable: the *sheer-plan*, showing all lines of length and height; the *half-breadth plan*, lines of length and breadth; and the *body-plan*, which shows breadth and height. From these combinations, the exact position of every point is determinable. Figs. 1 to 3 show those plans, called *construction drawings*, on the same scale for the *Great Eastern* steamship. The sheer-

plan represents, in its outside line, a vertical plane through the keel. The dotted lines 1, 2, 3, are the edges of supposed horizontal planes drawn at various heights. The curved lines, 1, 11, 111, are the edges, as they would appear on the outer covering of the ship, of vertical planes drawn parallel to the central plane through the keel. The uprights, A, B, etc., A₁, B₁, etc., are the edges of supposed planes drawn at given distances from the line of greatest breadth X, at right angles to the plane through the keel. The half-breadth plan represents one-half of the ship's upper deck, as regards the black outer line; the horizontal, vertical, and cross sections of the sheer-plan appearing again under different conditions. The vertical longitudinal sections become straight lines parallel to the keel; the horizontal sections appear as curves taken at different heights on the vessel's sides. The body-plan is the ship looked at end-on; the outer line being her cross section at the line of greatest breadth, and the horizontal and vertical sectional lines appearing at right angles to each other. The lines on the left side correspond to the cross sections of the after-body (that is, the portion of the ship nearer the stern than the line of greatest width), and the lines on the right side show the curvature of the ship's sides toward the stern; while in a similar manner those on the right side show the curvature up to the bow. Of course, in working drawings from which ships are to be actually built, the scale employed would be very large; and instead of three or four sectional lines in each direction, a great number would be inserted for the guidance of the builder. With these three plans in hand, the workman has the exact position of every point in the ship's exterior coating exactly defined. Even the unprofessional observer need not strain his imagination greatly to clothe these flat plans with their dimensions of length, breadth, and depth, and to conjure up before his eyes the precise form of the goodly ship represented.

FIG. 3.—*Great Eastern* Body-plan.

With the completion of the construction drawings the work of the naval architect

ceases, but in most cases the two professions of naval architect and ship-builder are combined in one firm, if not in one man. It is then to be decided of what material the ship shall be constructed. The choice lies between iron, steel, wood, and a combination of wood and iron. Of the many woods employed, oak, teak, and fir are those most commonly used. The building of a wooden and of an iron ship are quite distinct operations, the requisite strength being obtained in a different manner in each case. It is necessary, therefore, to consider separately the principles of wooden ship-building and iron ship-building; and as the older and most time-honored process, we will first deal with the art of the ship-wright who forms the vessel of timber.

In addition to the construction drawings which we have described, it is usual also to construct a small wooden model of the ship—upon a scale very often of $\frac{1}{4}$ inch to the foot—which shows the designer what his ship is going to look like better than the flat paper can do. This model is made of a number of horizontal layers of wood, and upon it the whole arrangement of the plating of the ship is marked, with the position of all the joints, etc.

Wooden Ship-building.—The first process is to develop or “lay off,” on the *mold-loft floor*, certain full-size working sections of the required ship. These are taken from the

construction drawings and the model, and are built up of planks. The combinations of these pieces of plank show the shape in which the several timbers will have to be cut, to impart the necessary curvature and strength.

The next step in actual construction is to prepare the slipway by raising a number of strong blocks of timber a short distance apart, on which the keel shall rest, and which shall sustain the entire ship when built. These blocks are composed of several pieces, and it is of the utmost importance that their upper surface be in an exact line. That line is made at an inclination of $\frac{1}{8}$ of an inch to a foot; and the keel of the ship, and the ship itself, have consequently that slope to the horizon while building. This inclination is for the facility it affords in launching the completed vessel. On the blocks is laid the keel, which may be called the backbone, and is certainly by far the most important timber in the ship. From it start the ribs, the stem, and the stern-post; so that any serious accident happening to the keel involves the breaking up of the whole structure. It is, therefore, made of great strength, being, in a first-rate, no less than 20 in. square. The material is usually elm, on account of its toughness, its non-liability to split, and the fact that immersion in sea-water preserves it. The pieces of which it is composed are united by the strongest kind of scarf joint (see CARPENTRY).

What the keel is to the bottom, the stem and the stern-post are to the bow and stern of the ship, forming the keys

FIG. 4.—Ribs and Decks in section:

A, keel; B, keelson; C, false keel; D, floor; EE, fut-tocks; F, top-timber; G, lengthening piece; H, H, wales; I, diminishing plank; K, bottom plank; L, garboard strake; M, beam; N, deck; O, shelf; P, waterway; Q, spirketing; R, clamps; S, knees; T, side-keelsons; V, timber strakes; W, rough-tree rail; X, mast.

from which the ends of the planking (technically called the “butts”) and all longitudinal supports start. Each is, of necessity, of great strength, and they rise from the respective extremities of the keel. The *stern-post* has to bear the rudder, and is usually made, when possible, of one piece of timber; it is united to the keel by a mortise and tenon joint. In screw-steamers there is a second stern-post, forming the forward support for the screw.

The extreme outlines of the ship being now established, the builder proceeds with the timbers to form the bottom and sides, which together constitute the *frame*, corresponding to the ribs in an animal. The ribs form the sides of the ship, and are placed at from 2 ft. 6 in. to 3 ft. 9 in. from center to center. Up to the water-line the spaces between them are filled in solid with timbers of equal thickness. For this purpose in the midship-body the keel is crossed at right angles, or nearly so, by certain timbers which form the *floor*. The keel is let about three-fourths of an inch into a groove running along the bottom of the floor, while above the floor the *keelson* is a massive timber, parallel to the keel. The keel and keelson are bolted firmly together by long copper bolts,

which pass through the timbers of the floor, and completely fix the latter. As an additional strengthening to the frame in large vessels, *side or sister keelsons* are bolted on to the floor or futtocks, a short distance on each side of the principal keelson. Fig. 4 is a cross section of a three-decked wooden vessel, showing a complete rib, with the principal parts as they are commonly arranged amid-ships. Near the ends of the ship the frames no longer stand at right angles to the keel, but are necessarily bent or canted round.

After the main skeleton, as it were, of the ship is built, the skin is the only thing remaining to complete its exterior. This is represented by thick wooden planking, fastened on to the ribs, the lowest layer pressing into the rabbet of the keel, and the highest reaching to the uppermost bulwark. The thickest planking is at the berds or wales, marked *ll* in fig. 4, where it varies from 4½ in. in small vessels to 10 in. in ships of the first class. Every complete line of planking from stem to stern is styled a *strake*. Oak and fir are the woods mostly used for the skin, and elm for the planks nearest the keel. The planks are generally fastened to the ribs by copper bolts, but wooden treenails are frequently employed, as less in weight than copper, and less liable to split the wood. The comparative utility of wood and copper fastenings for the strakes is still a disputed point.

In a well-constructed ship the filling in of the timbers to a level above the water-line should be so accurately formed that she would float without her planking; but when the latter has been well calked, it is certain that it adds greatly to the dryness of the ship, while it aids materially in binding her several parts together.

At frequent intervals across the ship, and at the heights of the several decks, are inserted the *beams*, which are solid masses of timber, either in one piece or scarfed. These prevent the ship from collapsing, and at the same time support the decks. The beams and decks are shown at *M* and *N* respectively in Fig. 4. The beams are always made convex upward, principally for the sake of preventing water lodging on the decks. When the beams are well established, the hatchways and mast-holes are traced out. This done, the deck is laid down of straight-grained hard wood, and the planks are calked and pitched between, until the deck or platform becomes perfectly water-tight.

Along the inside of the bottom are laid the *sister keelsons* or *side keelsons*, if the ship be large, and all spaces are filled up with planking, except the width of one plank next the keelson on each side, which is left for a drain to carry all refuse-water to the foot of the pumps.

Iron Ship-building—Iron affords, in many respects, a better material for ships than wood. In the first place, the same strength may be obtained with less weight; secondly, iron plates can be bent to any curve, so that the combinations necessary for strength in wooden vessels can be avoided. The laying off the lines of the vessel full size upon the mold-loft floor is the first process in iron as in wooden ship-building. Rough wooden templates are here made of the cross sections of the ship, one template to every cross section.

The slip-way is prepared in much the same way as in the case of a wooden ship. The keel is generally of flat bar-iron—sometimes in several thicknesses—the different lengths being scarfed at the ends and riveted together, or sometimes welded. In the cross section of a 2,000-ton iron vessel given in Fig. 5, the keel is in five thicknesses; in the middle a center-plate, which is carried upward through the floors, and forms a keelson; on either side of this a thick bar, and outside these again the two lowermost plates of the skin bent downward. The whole five thicknesses are riveted together.

The ribs in an iron ship are called “frames.” They are always made of angle-iron, and are placed from 18 in. to 2 ft. apart. They are bent, while red-hot, upon a large flat cast-iron plate, into the proper curve, fixed by the templates already mentioned. The frames, when thus bent to the right shape, are set up in place upon the keel. To them are fastened at the bottom the *floors*, which are narrow plates running across the ship; and frequently additional stiffness is gained by running “reverse” angle-irons along the top of the floors, throughout at least a considerable portion of the ship’s length. The beams which support the deck are convex upwards as in wooden ships. After the frames, floors, and beams are in place, the plating commences, each particular plate being of a size and shape exactly as determined by the model. The lowest plates of all are called the “garboard strake,”

FIG. 5.—Section of Iron Ship:

a, frames; *b*, reverse angle-irons; *c*, floors; *d*, keelson plate; *e*, *e*, decks; *f*, *f*, deck beams; *g*, bulwarks; *h*, *h*, stanchions; *i*, *i*, bilge keelsons; *k*, keel line.

and are usually bent downward and riveted to the sides of the keel, as in fig. 5. The thickness of the plates gradually diminishes upward, till the "sheer strake"—the strake at the level of the main deck—is reached, and this is always made very strong. The deck beams are further secured and stiffened by longitudinal and diagonal plates called "stringers." All the iron-work of a ship is fastened together by rivets. Holes are first punched or drilled in the plates and angle-irons—in most cases before they are put together. The holes having been made exactly to overlap, a red-hot rivet is inserted through them. A man, called a "holder-up," holds the head of the rivet forcibly in its place with an iron tool, while two riveters on the other side of the plate strike its end rapidly with their hammers until it is all hammered down. The contraction of the rivet when it cools causes it to hold the two plates still more tightly together. Iron ships are always divided into a number of compartments by transverse partitions called "bulkheads." These partitions can easily be made water-tight, and then afford great additional security to the vessel, as, in the event of a leak occurring, it will often be possible to confine the water to the space between two bulkheads, and there will be sufficient buoyancy in the other compartments to keep the vessel afloat. The bulkheads are fitted with water-tight doors, and besides being a source of safety, they are also the cause of great additional transverse strength.

By the time that the external plating of the ship is finished, and the beams and bulkheads all in their places, she is ready for launching; much, however, still remains to be done to her. Most frequently, the greater part of the decks has to be laid, and the whole of the cabin fittings to be put up; the rudder and steering gear have to be fitted; the wooden "ceiling" (which lines the hold) to be put in; the masts have to be set, and all the spars, sails, and rigging put up; and lastly, in a steam-vessel, the engines and boilers have to be placed and properly secured on the seatings provided for them.

Steel has as yet been but little used in the construction of ships. As it possesses much greater strength than iron, all the various parts of a steel ship may be made much lighter for the same strains than in an iron one. There has been, however, a very widespread distrust of this material among ship-builders, based, to some extent justly, on the difficulty of getting really reliable steel plates and bars; and this has been the principal cause of its non-use. With greater facilities for the manufacture of steel, and consequent reduction in its price and improvement in its quality, we may still expect to see it largely used as a material for ship construction.

Ships of Iron and Wood conjointly, or "composite" vessels.—It was at one time thought that various advantages would be obtained by the use both of iron and of wood in the same ship, the frame and beams being made of the former material, and the skin of the latter. Composite vessels were always more used by the French than among ourselves, but although Lloyd's committee have thought this class of vessels of sufficient importance to publish special rules in reference to it, very few composite ships are now constructed. During 1872 only 7 such vessels (of a gross tonnage of 1069 tons) were launched, and 6 more (of a gross tonnage of 1430 tons) were in course of construction at the close of the year.

In some recent ships of war (e.g., the *Triumph* and *Swiftsure*), the vessels, after being built of iron in the usual way, and heavily armored, have been covered all over with planking, and copper-sheathed. The object of this has been to insure that the ship's bottom shall not be fouled with weeds and barnacles, which so easily happens with iron vessels, as these frigates are intended for very high speeds.

Internal Arrangements of a Ship.—Whether the vessel be of iron or wood, her internal design must follow the purposes for which she may be required. As a general principle, the ship is divided into a greater or less number of platforms, floors, or decks (q.v.), devoted to various purposes. In a ship-of-war a large portion is required for the men, the remainder being occupied by warlike stores, provisions, and coal. In a merchant-vessel far less space is allotted to the crew, and far more to the cargo. In every ship a space must be provided for the carriage of provisions and water proportionate to the number of the crew and the intended duration of voyages. A steamer differs from a sailing vessel in requiring a large compartment amidships to be kept clear for her engines and boilers. In screw-steamers, to the height of the boss of the screw above the keelson, a tunnel known as the *screw-alley*, has to be kept open for the shaft of the screw from the engine-room to the stern. The heavier portion of a cargo, as coal and water, is carried immediately above the keel, so that the center of gravity may be as low as possible, and for the same reason the engines and boilers are placed as low down as practicable. For various details concerning the formation and arrangement of ships, the reader is referred to detached articles descriptive of the respective portions, as DECKS, MASTS, CAPSTANS, CHAINS, CHANNELS, HOLD, KEEL, SAIL, SHEATHING, etc.

Lloyd's.—In order that a ship may be insured by the underwriters, it has to be inspected and surveyed by one of the surveyors of "Lloyd's." According to the reports of their surveyors, the committee of Lloyd's registry classify the vessel, affixing to its name a letter which is intended to be as nearly as possible a correct indication of its real and intrinsic qualities. For wooden vessels, these letters (in order of excellence) are A (in black or red), Æ, E, and I; for iron ships or steamers they are , , and . Numbers put before these letters indicate the number of years for which they are to

hold the grade indicated by the letter; and numbers (1 or 2) put after the letters refer to the completeness of their general equipment.

The table below gives details as to the number and tonnage of the vessels built in the United Kingdom during the year 1875. In 1877 the total numbers were 1096 vessels, of 433,694 tons.

SHIP CANAL, INTEROCEANIC. See INTEROCEANIC SHIP CANAL.

SHIP-MONEY, a tax had recourse to in England at various times, but especially in the reign of Charles I., for the equipment of a fleet. In 1007, when the country was threatened by the Danes, a law was made obliging all proprietors of 310 hides of land to equip a vessel for the protection of the coast. Elizabeth, at the time of the threatened Spanish invasion, required the various ports to fit out a certain number of ships at their own charge; and so great anxiety was shown by the public for the national defense, that London and some other ports furnished twice as many vessels as had been demanded. It was in 1626 that Charles first had recourse to an impost of this description, requiring each of the maritime towns, with the assistance of the neighboring counties, to arm a given number of vessels, 20 being required from London. In 1634 the tax was extended over the whole kingdom. A general spirit of resistance was immediately aroused, not so much in consideration of the amount of the tax, as of the objectionable feature, that it was imposed by the arbitrary authority of the king alone, which had come to be regarded as an unwarrantable stretch of the royal prerogative. In 1637 the celebrated John Hampden, a gentleman of property in Buckinghamshire, resolved to confront the power of the government by disputing the legality of this exercise of the prerogative, and resolutely refused payment of the impost, an example in which he was followed by nearly the whole county to which he belonged. He was prosecuted in the exchequer chamber for non-payment, and his trial was watched with great interest and anxiety by the nation on account of the constitutional point involved in it. The judges, four excepted, pronounced in favor of the crown; but the trial had the effect of thoroughly arousing the public mind to the danger of the imposition of taxes by the royal authority alone. The long parliament, shortly after its meeting in 1640, voted ship-money illegal, and the sheriffs and others who had been employed in assessing it or collecting it to be delinquents; and canceled the sentence against Hampden.

SHIPPEN, WILLIAM, 1735-1808; b. Philadelphia; graduated at Princeton college in 1754; studied medicine with his father, afterward at London and Edinburgh; returned to Philadelphia and lectured on anatomy in 1762; became professor of anatomy and surgery in the Philadelphia medical school in 1765; was in the medical department of the army in 1776, and its director general in 1777-81.

SHIPPING. See MERCHANT SHIP. ACT.

SHIPPING, LAW of, treats of the ownership and employment of ships, the rights and obligations of their owners, masters, and seamen, and of the owners of their cargoes, and all contracts and torts arising from the employment of ships. By the U. S. statutes, the owners, masters, and officers of a vessel must be U. S. citizens to make it a U. S. vessel; it must be built in the United States, and must be duly registered or enrolled. Whenever it is sold, the bill of sale must recite the original certificate of enrollment or registry, or it cannot obtain a new registry. If the vessel is for foreign commerce, the necessary facts are presented on affidavit to the collector of the district, who issues a certificate of registry, which is evidence anywhere of the nationality and character of the vessel, whose name and that of its owners as well as its tonnage, where it belongs, etc., must be recited. If the vessel be less than 20 tons burden, only a license is necessary. If the vessel be over 20 tons burden and designed for fishing or the coasting trade, a certificate of enrollment issues in the same way in addition to a license. The rules of property in ships, unless modified by statute, are the same as those of other chattels. By statute, title to a U. S. vessel can be had only by building, by a judicial sale as a prize or for forfeiture, or by purchase and repair in this country at a cost of at least three-fourths its value, of a wicked foreign vessel. By statute, also, every conveyance, mortgage, or bill of sale of any vessel or part of a vessel of the United States must be recorded in the office of the collector of the district where the vessel is registered or enrolled; otherwise such conveyance, etc., is valid only against the grantor, etc., his heirs and devisees, and persons having notice in fact. As to persons employed in navigating the ship, only the powers of the master need be considered here; the rights of the seamen, whose claim for wages takes precedence of all other liens upon the vessel, and is enforced in admiralty by a proceeding *in rem*, are protected by comprehensive statutory provisions. But the liability for wages is conditional upon earning freight on the voyage. The master has an absolute authority over the officers and crew, and in the navigation of the ship. He may bind the owners on all ordinary shipping contracts, which are usually executed in his name, and upon which suit may be brought by or against him personally. He may borrow money for repairs, hypothecate ship or cargo, and, in certain cases, even sell or abandon both. It is now held, however, that, before resorting to any extraordinary step, he must, if within reach of the telegraph, get instruction from his principals. The rights and liabilities of owners of vessels are, unless limited by statute, identical with those of common carriers. See **CARRIERS**. For the two principal shipping contracts, see **BILL OF LADING** and **CHARTER PARTY**. For the rules of navigation, see **NAVIGATION, LAW AS TO** (*ante*). And for so much of the subject as is not treated here, see **MERCHANT SHIPPING ACT** (*ante*), **PART OWNERS**, **SHIP'S HUSBAND**, **DEMURRAGE**, **STOPPAGE IN TRANSITU**, **FREIGHT**, **AVERAGE**, **BOTTOMRY**, **RESPONDENTIA**, **SALVAGE**.

SHIP'S HUSBAND, the maritime term for an agent appointed by the owners to attend to all matters connected with the outfit, repairs, and freighting of the ship. Under this capacity his powers have been held to be very large. He must see to it that the ship is seaworthy in all respects, has a proper crew and officers, is fully furnished with provisions, and has proper clearances and registry. He has power to enter into charter-parties (q.v.), and may settle freight-contracts, but has no power to insure the vessel nor to borrow money for her use; nor has he as ship's husband any lien on ship or proceeds. He is usually one of the part-owners (q.v.), and his powers may be enlarged by acts of the owners.

SHIP-WORM. See **TEREDO**.

SHIP WRECKS, in ancient times, were deemed the property of the crown, but by a statute of Henry I., the harsh consequences of this law were avoided whenever any person escaped alive out of the ship; and in Henry II.'s charter it was declared that if either man or beast escaped alive, the goods should remain to the owners if claimed within three months; and the courts of law still further refined away all these harsh rules. Many nice distinctions have been made as to what goods constitute wreck, which is distinct from goods floating. See **FLOTSAM**. By the recent merchant shipping act, 1854, which extends to the United Kingdom, the board of trade has the superintendence of all matters relating to wreck, and to jetsam, flotsam, and ligan. Receivers of wreck are appointed for various districts, and have power to summon assistance. When wreck is found by any person, he must give notice to the receiver of wrecks, and if nobody claim the property within a year, it is sold, and the proceeds, after paying salvage and other such expenses, are paid into the exchequer. Persons plundering wreck are guilty of felony, and may be punished with 3 to 14 years' penal servitude; and any person exposing false signals to cause wreck, may be sentenced to penal servitude for life.

The number of wrecks, casualties, and collisions from all causes, on or near the coasts of the United Kingdom, reported in 1874-5, was 3,590; a large increase on previous years, accounted for in great measure by the inclusion of small casualties not previously counted, etc. In the year 1875-6, a still higher number—3,757—was reported. Of the casualties of 1874-5, about 1 in 23 resulted in loss of life. It having been found in numerous instances that the direction and force of the wind as given by the masters in their reports differed more or less from the particulars of weather reported to the meteorological office during 1872, steps were taken toward making strict inquiry at the

moment into all such variations. The life lost in 1874-5 was distributed as follows: In fishing smacks, 110; in vessels carrying heavy cargoes in bulk, 207; and in other vessels 609. Three hundred and thirty-eight wrecks and casualties happened in 1874-5 to nearly new ships, 646 to ships from 3 to 7 years of age; 921 to ships from 7 to 14 years old; 1292 to ships from 15 to 30 years; 567 to ships from 30 to 50 years; 74 to ships between 50 and 60; 31 to ships between 60 and 70; 18 to ships between 70 and 80; 11 to ships between 80 and 90; 3 to ships between 90 and 100; and 3 to ships over 100 years. The ages of 385 vessels were unknown. The sum paid by the board of trade out of the mercantile marine fund for providing apparatus for saving lives on the coasts of the United Kingdom in 1874-5 was £11,010; the expenditure on this account in the 20 years 1855-75, was £163,445, besides £1337 paid by the admiralty on account of life-belts. At the end of June, 1875, there were on the coasts of the United Kingdom, 277 sets of rockets or mortar apparatus provided by the board of trade. The number of life-boats in 1875 was 273, of which 244 belonged to the national life-boat institution; and 29 (of which six were subsidized by the board of trade) were under other management, 548 stations were supplied with capt. Ward's life-jackets for the use of the coast-guard. The number of volunteer life brigades in 1875 was 5, and the number of volunteer life companies, 1160. The number of lives saved on or near the coasts of the United Kingdom in 1874-5 was 3,837—502 being saved by life-boats; 355 by rocket and mortar-apparatus lines, etc.; 511 by luggers, coast-guard, and other boats; 440 by ships and steam-boats; 1644 by ships' own boats, etc., and 285 by other means. The number of lives saved on or near the coasts of the United Kingdom in the 20 years 1855-75 was 77,918. The number of inquiries held by the board of trade in 1872 was 49; by order of naval or consular officers, 24; by a court in a British possession abroad, 96.

SHIRAS, ALEXANDER EAKIN, 1812-75; b. Philadelphia; graduated at West Point, 1833; commissioned in the artillery; 1839-43, was professor at West Point. In the Mexican war he served in the commissary department, and was assistant to the commissary general, 1847-63. In 1874 he was made commissary general with rank of brig.gen. In 1865 he received the brevet ranks of brig. and maj.gen.

SHIRAZ, a celebrated city of Persia, and the capital of the province of Fars, in lat. 29° 41' n., long. 52° 38' e., was formerly a very flourishing city, and the ordinary residence of the Persian monarchs, but is now singularly divested of its ancient splendor. It is situated in a wide plain, on one of the limestone ledges which shoot out from the great west-Persian mountain system, 112 m. from the Persian gulf, and 35 s.w. of the ancient Persepolis (q.v.). It is inclosed by walls nearly 4 m. in circumference, and, previous to the great earthquakes which have repeatedly laid it in ruins, contained many splendid mosques, bazaars, caravansaries, and other public buildings. The houses, which are mostly built of stone, are superior in appearance to those of most other Persian towns; and the adjoining portion of the plain is of exuberant fertility, and is laid out in vineyards and in rose-gardens of great extent. The principal manufactures are silk, cotton, and woolen goods, cutlery, fire-arms, glass, and earthenware. The wine of Shiraz, which is very strong and resembles Tokay, is still famous throughout the east. Rose-water is also still prepared in large quantities. The trade of the town is transacted in the *bazar-i Wukell*, which is about a quarter of a mile long by 40 ft. wide, and affords accommodation to several hundred shop-keepers. Shiraz carries on trade with Yezd, Ispahan, and Bushire, from the last of which towns it receives Indian and European goods. The city was founded in 697 A.D., and from its beautiful situation and charming climate became a favorite resort of the Persian princes; but a destructive earthquake in 1812 laid a large portion of it in ruins, and another in 1824, which cost the lives of 4,000 of the inhabitants, completed the wreck of its prosperity. It was, however, rebuilt, and had attained a pop. of 40,000 (its pop. previous to 1812 having been almost 60,000), when a third and more terrible visitation of this destructive agent, in April, 1853, laid almost the whole town again in ruins, and caused the death of 12,000 people. It has since been partially rebuilt in a somewhat inferior style, and its pop. is now estimated at 25,000. It is celebrated for the number and eminence of the scholars and poets to whom it has given birth; chief of these is Sibuyah, the first of Arab grammarians; Hafiz (q.v.), the "Anacreon" of Persia, whose tomb is half a mile n.e. of the Ispahan gate; and Saadi (q.v.), whose mausoleum is 22 m. to the n.e.—See *History of Persia*, by Clements Markham, 1874.

SHIRÉ, a river of south-eastern Africa, has its source in lake Nyassa, from which it issues in lat. 14° 28' s., and after a southerly course of 250 m., joins the Zambesi. It flows through a cotton and sugar producing country of vast extent, is 80 to 150 yds. broad, 12 ft. deep, and never varies more than 2 or 3 ft. from the wet to the dry season. Its current travels at the rate of 2½ knots an hour. The navigation is obstructed by cataracts over a space of 35 m., in which it falls 1200 feet.

SHIRE (Sax. *sciran*, to divide), a term which seems to have originated in the 8th c., and is applied to the districts, otherwise called counties, into which Great Britain is divided. A considerable number of the counties of England, as Kent, Essex, Surrey, Norfolk, Suffolk, were formed out of the petty kingdoms of the Anglo-Saxons, which, with the advancing tide of centralization, were gradually becoming consolidated into one great kingdom. As early as 800, an entry in the Saxon chronicle relates that kings had ceased to reign among the *Hwiccas* (the inhabitants of the district afterward known as

Worcestershire), and that they were governed by an ealdorman acting under Cynwulf, king of Mercia. This substitution of ealdormen (or earls) for kings marks the gradual organization of the counties. It was sometimes found convenient to split up a kingdom into several shires. The civil, military, and judicial head of the shire was the ealdorman, whose office was not necessarily hereditary, though it had sometimes a tendency to become so. Twice a year he held the shire-mote, in which he and the bishop presided with equal jurisdiction. Among other questions which would come before the shire-motes were those that related to the boundaries of the respective shires. As a border thane pushed his occupation toward the frontiers of the shire to which he belonged, and came into collision with the occupants of the neighboring shire, questions necessarily arose which could only be settled by a compromise arranged by the two shire-motes, and these compromises may account for the irregular jagged boundaries which separate shire from shire, and occasional isolation of particular portions. Yorkshire, Durham, Cheshire, and Worcestershire derived their name from their ancient bishoprics. Various shires which had once an existence in the n., as Northamptonshire, Islandshire, Hexhamshire, Hallamshire, Bamboroughshire, have merged into others. The term shire is nearly synonymous with county, yet not quite so, as there are certain counties with whose names the affix "shire" is never used. One explanation which has been given of this usage is, that the object of the addition of the syllable "shire" is to distinguish the county from the town of the same name, and that it is therefore only applicable to counties bearing the same name with their county town. Another explanation is that shire, being a word of Anglo-Saxon origin, is not properly applied to any of the English counties except those which formed part of the larger Anglo-Saxon kingdoms. Neither of these reasons is exactly correspondent with the actual usage by which shire terminates the names of all the English counties except the following: Northumberland, Cumberland, Westmoreland, Durham, Norfolk, Suffolk, Essex, Sussex, Middlesex, Kent, Surrey, and Cornwall. In Cheshire we drop the final syllable of the town of Chester. Berkshire, Shropshire, and Hampshire are never used in their simple form, though sometimes abbreviated into Berks, Salop, and Hants. Shire is applied to all the Welsh counties except Anglesea.

In Scotland, the English tendencies of the sovereigns from the time of Malcolm Canmore to the war of succession, and the tide of immigration from the s., brought in, among other innovations, the division into shires. Its introduction seems to have begun early in the 12th century. Twenty-five shires or counties are enumerated in a public ordinance of date 1305. Nearly all the counties of Scotland may receive the terminal addition of shire. It is not applied to the island county of Orkney, and seldom to the counties of Bute and Caithness. Kirkcudbright is neither a shire nor a county, but a Stewartry. See STEWARTRY. The Irish counties are not generally called shires.

In England, s. of the Tees, there was a subdivision of the shires into *hundreds*, which originally, in theory at least, seem to have been districts inhabited by 100 or 120 families; and were in some localities called *wapentakes*, these hundreds or wapentakes being further subdivided into *tythings*, inhabited by ten free families; and it became incumbent on every one to be enrolled in a tything and hundred for the purposes of civil government. In some of the larger counties there was an intermediate division to which that into hundreds was subordinate. Yorkshire had and still has its *ridings* (q. v.), Kent had its *lathes*, and Sussex its *rapes*. The division into hundreds and tythings never penetrated into the four northern counties of England, or into Scotland, where the *ward* and *quarter* were the immediate subdivisions of the county.

England possessed three *counties palatine*—Cheshire, Lancashire, and Durham—of which the earls formerly possessed all the judicial and fiscal powers of the crown, all now annexed to the crown (see PALATINE). Similar privileges belonged to the earldom of Strathern in Scotland.

SHIRLEY, JAMES, 1594-1666; b. London; educated at Oxford and Cambridge; was curate at Hertfordshire, but soon resigned on account of becoming a Roman Catholic; opened a school at St. Albans, but, being unsuccessful, went to London, and became a dramatic writer. He founded a classical academy in London. His *Dramatic Works and Poems* were published in six volumes.

SHIRLEY, WILLIAM, 1693-1771; b. England; studied law and emigrated to Boston, 1734; was a commissioner to determine the boundary between Massachusetts and Rhode Island; governor of Massachusetts, 1741-45, and again in 1753, after a sojourn of eight years in England; commander-in-chief of the forces in British North America against the French, 1755; lieutenant-governor, 1759, afterward governor of the Bahama islands; returned to Massachusetts and built a residence at Roxbury in which he died. He wrote *Electra*, a tragedy, and a *Journal of the Siege of Louisbourg*.

SHIRWA, or **TAMANDUA**, a lake of s. e. Africa, n. end 30 m. s. e. of lake Nyassa, lat. of center 15° 10' s., long. 35° 40' east. It is of an oval shape, tapering to the s.; length, 60, breadth, 10 to 23 m., and 1800 ft. above the sea level. It is surrounded by elevated land. On the w., between the lake and the river Shiré, Mt. Zomba rises to 7,000 feet. Several small rivers enter the lake on the s. and west.

SHIS'DRA, or **JIS'DRA**, a t. of European Russia, in the government of Kaluga, and 80 m. s. w. from Kaluga, on the Shisdra, a branch of the Oka. It has manufactures of woollen cloth, glass-works, iron-works, tanneries, oil-factories. Pop. '67, 10,572.

SHISHAK (in hieroglyphs, Shashank, the Susak or Susakim of the Septuagint, and the Shishak of the Hebrew version, the Sesonchosis or Sesonchis of Manetho), the name of several monarchs of the 22d, or Bubastite Egyptian dynasty, supposed to have descended from foreign settlers in Bubastis, and to have been of Shemitic origin. The kings of this name were Shishak I., the first monarch of the dynasty, whose name is found in the portico built by the Bubastite dynasty at the great temple of Karnak, and on several statues of the goddess Pasht, which probably came from Luxor. Jeroboam fled to Shishak from the pursuit of Solomon, who wished to kill him, and lived there during the lifetime of Solomon. On the death of this monarch, Jeroboam quitted Egypt, and contended with Rehoboam for the possession of the crown. This struggle caused the division of the kingdom of David into two states, that of Israel and Judah. In the fifth year of Rehoboam, Shishak marched to Jerusalem with an army of 12,000 chariots, 60,000 cavalry, and an innumerable number of infantry, composed of Troglodytes, Libyans, and Ethiopians. He took the city, the treasures of the temple, and all the gold bucklers which Solomon had made. The conquest of Jerusalem is found recorded on the monuments of Karnak, on which Shishak I. is represented dragging before the god Ammon three files of prisoners, inscribed with various names of places, among which are Judea, Mageddo, Ajalon, Mahanaim, and other towns taken by Shishak in his line of march.

SHITIM-WOOD. It is not certain what kind of wood is meant by this name in the Old Testament. The ark of the covenant was made of it, and probably it was a kind of wood distinguished both for beauty and durability. It has generally been supposed to be the wood of the *acacia nilotica*, which, however, is deficient in both these qualities. Another supposition is, that the wood of a species of olive is meant, *olea similis*, which possesses them both, and is particularly remarkable for its durability.

SHIVES, a name used by cork-cutters to designate the small bungs used to close wide-mouthed bottles, in contradistinction to the phial-corks used for narrow-necked bottles.

SHOA, a kingdom of Africa, the most southern division of Abyssinia, in lat. 8° 30' to 10° or 11° n., long. 38° to 40° 30' east. Its boundaries, however, are by no means fixed, that on the w., where Shoa is bordered by the Galla tribes, being specially variable. An extensive tract in the e. of the kingdom, between the capital, Ankobar, and the river Hawash is called Efat. The character of the country, and the condition of the people, are described under Abyssinia (q.v.).

SHOCK, COLLAPSE, AND REACTION. It is well known that some forms of injury, as, for example, a blow on the pit of the stomach, may occasion death without leaving any visible trace of their operation in the body; and, indeed, life may occasionally be destroyed even by sudden and powerful mental emotions. In such cases as these death is said to result from shock, the actual cause of death being the sudden arrest of the heart's action, consequent on the violent disturbance given to the nervous system. Instead of actual death, the condition known as *collapse* is more frequently induced, in which the patient lies in a state of utter prostration, and apparently on the verge of dissolution. The face, and even the lips, are pale and bloodless; the skin is cold and clammy, and drops of sweat are often seen on the forehead. The features are contracted, and there is great languor in the general expression. There is extreme muscular debility, and the sphincter muscles sometimes relax, so that there is involuntary discharge of the contents of the bowels and the bladder. The pulse is quick, and so feeble as often to be almost imperceptible, and the respiratory movements are short and weak, or panting and gasping. The patient is in some cases bewildered and incoherent, in others drowsy, and sometimes almost insensible. Nausea and vomiting, with hiccups, are not unfrequent symptoms; and in the case of children, convulsions are often present.

When a person recovers from a state of collapse, he passes into a condition termed *reaction*, which often lasts for several hours. The first symptoms of this favorable change are improvements in the state of the pulse and the respiratory actions, recovery of the power of swallowing, an increased temperature, and an inclination to move from the supine position to one side. A slight degree of feverishness then often ensues, after which the skin becomes moist, the patient falls asleep, and awakes convalescent. As a general rule, the longer the symptoms of reaction are delayed, the greater is the danger, and if several hours pass without any sign of the commencement of reaction, there is little hope of recovery. If the reaction is imperfectly developed, a condition may supervene which is known as "prostration with excitement," which may terminate either fatally or favorably, and into the symptoms of which our limited space will not allow us to enter further than to remark that a peculiar delirium, closely resembling *delirium tremens*, is most commonly present.

The principal causes of collapse (as given by Mr. Savory in his article "Collapse, and the General Effects of Shock upon the System," in Holmes's *System of Surgery*) are:

"Injuries sudden and severe, or extensive, as contused and lacerated wounds, involving a considerable amount of texture—the crushing of a limb, for instance. Burns present familiar and striking examples of extreme collapse, produced by this cause. Under this head, too, come capital operations. Injuries of very important organs, as the liver or other of the viscera, or of the joints, or other organs abundantly supplied with nerves. Pain alone, when intense and protracted, has proved fatal in this way; and it appears in

a case related by sir A. Cooper that sudden relief from great agony was attended by the same untoward result. Certain poisons operate in this manner, depressing the system so suddenly and severely as to produce a state of collapse; tobacco, for example; and drastic purgatives have in some cases induced a similar condition."

The effects of shock are aggravated by loss of blood; and hemorrhage alone, if sudden and profuse, will produce collapse. General debility and old age favor the influence of the shock, and much depends upon the idiosyncrasy of the patient; an injury which will produce no apparent effect on one man, often producing a serious and persistent impression on another.

The following are the most important points in regard to treatment: The patient should be kept in a horizontal position, with the head on the same level as the body, and he should not be raised till decided symptoms of reaction appear. The best stimulus is brandy, given in the form of hot brandy and water. "Its effects," says Mr. Savory, "are most certain and decided, and it suits the stomach best. It will remain when all other stimulants are rejected. The state of the circulation and the temperature are the guide to its use. If no effects are apparent after an ounce or two have been swallowed, it is very questionable if any advantage will be gained from a larger quantity." At the same time heat should be applied to the pit of the stomach and the extremities, by means of hot flannel, hot-water tins, or, in their absence, bottles containing hot water, and other appliances. Nourishment, in the form of beef tea, should closely follow the stimulants; the two may be combined with the greatest advantage, and as the system rallies, the latter may be entirely replaced by the former.

In those cases in which a patient is in a state of extreme collapse from an injury requiring a capital operation, such as the amputation of a limb, the operation should be performed as soon as his condition will admit of it; and although it should not be undertaken while the prostration is extreme, it is not necessary, or even advisable, in Mr. Savory's opinion, to wait for complete reaction; and this is the opinion of most of our best surgeons. Moreover, in these cases, the use of chloroform is not expedient; for, in the first place, it cannot be safely administered to a patient so depressed; and, secondly, the chief reason for its employment is wanting, for a person in a state of collapse is comparatively insensible to pain. For further information on this subject, the reader is referred to Travers *On Constitutional Irritation*, and to the excellent article of Mr. Savory from which we have freely borrowed.

SHODDY formerly meant only the waste arising from the manufacture of wool; it now has a wider and much more important signification, and is almost wholly understood to mean the wool of woven fabrics reduced to the state in which it was before being spun and woven, and thus rendered available for remanufacture. Woollen rags, no matter how old and worn, are now a valuable commodity to the manufacturer; they are sorted into two special kinds, the rags of worsted goods and the rags of woollen goods, the former being made of *combing* or long-staple wools, and the latter of *carding* or short-staple wools. The former are those properly known of *shoddy-rags*, and the latter are called *mungo*. Both are treated in the same way; they are put into a machine called a *velley*, in which a cylinder covered with sharp hooks is revolving, and the rags are so torn by the hooks, that in a short time all traces of spinning and weaving are removed, and the material is again reduced to wool capable of being reworked. It was formerly used as a means of adulteration and cheapening woollen cloths, but it is now found of greater advantage in making a class of light cloths adapted to mild climates and other purposes.

The name is a purely technical one, which has arisen among the Yorkshire spinners, and is derived from *shed*, the term having been formerly applied by the operatives to the *flue* or waste shed or thrown off in the process of spinning. See WOOLEN MANUFACTURES.

SHOEING OF HORSES. In olden times, horses generally went unshod, as they now do in many eastern countries; but our macadamized roads and paved streets, our fast paces and heavy loads, would speedily wear away the stoutest hoofs, and a rim of iron has accordingly been long in use as a protection. In style and pattern, the horse's shoe varies almost as much as his master's boot, and like it, when badly made, or unskillfully fitted, produces serious inconvenience, and even leads to accidents and diseases. When the feet are strong and properly managed, nothing is better than a plain shoe of tolerably uniform breadth and thickness, carefully fashioned to the shape of the foot. But many good authorities prefer what is called a seated shoe, which has a level part for the crust to rest upon, and within that the inner half of the shoe toward the sole surface is beveled off. This seated shoe is thus wider than the plain shoe, and hence affords greater protection for a weak or a flat sole. For faulty or diseased feet, special forms of shoes are suitable. In all healthy feet, the shoe should be fitted to the foot, and not, as is commonly done, the foot cut to fit the shoe. Another frequent error of keeping the shoe short and spare at the heels must be avoided. For roadsters the toe of the fore-shoes should be slightly turned up, which greatly obviates tripping. The hind-shoes are generally thickened, and sometimes turned down at the heels. The number of nails required must vary somewhat with the weight of the shoe and soundness of the horn; five is the minimum, nine the maximum. It is important, however, that the shoes be firmly held on by as few nails as possible. In a saddle-horse with

sound feet, three on the outside, and two on the inside, should suffice to hold a well-fitted shoe. Horses for heavy draught are generally shod in Scotland with tips and heels, which afford increased firmness of tread, and greater power, especially when dragging heavy loads. To preserve the foot in a sound state, the shoes should be removed every month. When the shoe is carefully taken off, the sole-surface on which it has rested should be rasped, to remove any ragged edges and any portions of adhering nails. Having for a month been protected from the wear to which the exposed portions of the foot are subjected, it will probably have grown considerably, and, in a stout hoof, will require to be cut down with a drawing-knife, especially toward the toe. Except in very strong feet, and in farm-horses working on soft land, the surface of the sole uncovered by the shoe seldom requires to be cut. It is the natural protection of the internal delicate parts, and must be preferable to the leather and pads often artificially substituted for it. The bars must likewise remain untouched, for they are of great service in supporting weight; while the tough, elastic frog must be scrupulously preserved from the destructive attacks of the knife, and allowed uninjured to fulfill its functions as an insensible pad, obviating concussion, and supporting weight. When the shoe is put on, and the nails well driven home, they should be broken off about an eighth or even sixteenth in. from the crust, and hammered well down into it. This obviously gives the shoe a much firmer hold than the usual practice of twisting off the projecting nail close to the crust, and afterward rasping down any asperities that still remain. When the shoe is firmly clinched, the rasp may be very lightly run round the lower margin of the crust, just where it meets the shoe, to smooth down any irregularities, but all further use of the rasp must be interdicted. The clinched nails, if touched, will only have their firm hold weakened; nor must the upper portions of the crust, which blacksmiths are so fond of turning out rasped and whitened, be thus senselessly deprived of those external unctuous structures, which render the unrasped foot so tough and sound, and so free from sandcracks. To prevent the hoof becoming too dry and hard, it is advisable, especially in roadsters, and in hot weather, to stop the feet several times a week with a mixture of equal weights of lard, tar, bees-wax, and honey, with about one-fourth part of glycerine, melted together, well stirred, and preserved in pots for use. Fuller details on this subject will be found in a little volume entitled *Notes on the Shoeing of Horses*, by lieut.col. Fitzwygram, 15th (the king's) hussars; and in a paper on "Horse-shoeing," by Mr. Miles, published in the *Journal of the Royal Agricultural Society of England*, and reprinted in a separate form by Mr. Murray, Albemarle street, London.

SHOES—SHOE-TRADE. Clothing for the feet, whether in the form of sandals or shoes, has been in use in every country aspiring to civilization in ancient and modern times. The rudimentary shoe is a sandal consisting of a sole, held to the foot by straps and thongs. Such were the common Egyptian and Greek shoes, to which the shoes of the peasantry of the Abruzzi, in the s. of Italy, bear a close resemblance. In Egypt, however, the ordinary material for shoes were stripes of the papyrus interwoven like a mat. As is seen from paintings on the walls of Thebes, shoe-making formed a distinct trade in the reign of Thothmes III., 1495 B.C. or about the period of the flight of the Israelites. The streets of Rome were encumbered by the stalls of shoe makers in the reign of Domitian. The shoe of the ancient Hebrews was a species of sandal. For ladies, the sandal, translated "shoe," in the Scriptures, was highly ornamental. "How beautiful are the feet with shoes, O prince's daughter" (Cant. vii. 1). Ornamented slippers are still a luxury in the east. The foot-coverings of the Romans were various in character, from the simple sandal and slipper to the boot, which extended up the leg. When the shoe covered the whole foot it was termed *calceus*; the calceus of a particular form and of great strength worn by the Roman soldier was known as *caliga*.

Reference is made in Scripture to different symbolical usages in connection with sandals or shoes. The delivery of a shoe was used as a testimony in transferring a possession: "A man plucked off his shoe, and gave it to his neighbor: and this was a testimony in Israel" (Ruth iv. 7). In cases of this kind, the throwing of a shoe on a property was a symbol of a new proprietorship or occupancy: "Over Edom will I cast my shoe" (Psalm lx. 8). From these ancient practices, in which the shoe was symbolical of contract, perhaps comes the curious old custom in England and Scotland of throwing old shoes for good luck after a bride and bridegroom on departing for their new home.

St. Crispin and his brother Crispinian have long been regarded as the patron saints of shoemakers. According to mediæval legend these personages were natives of Rome, and having become converts to Christianity, traveled into France and Britain to propagate the faith, everywhere supporting themselves by making shoes, which they sold to the poor at a very low price—one part of the legend being that an angel supplied them with leather. It is said that they suffered martyrdom in England toward the end of the 3d century. The memory of St. Crispin, of whom we chiefly hear, has, from time immemorial, been kept up by processions and other festivities in his honor on Oct. 25, which is known as "St. Crispin's day." Under this saintly tutelage, shoemaking has attained to the distinctive appellation of the "gentle craft;" and is noted for the number of individuals who have risen from it to eminence. See an amusing but scarce work, *Crispin Anecdotes*; and a trade newspaper called *St. Crispin*. The sedentary and solitary nature of the craft, as hitherto conducted, has possibly had some influence in producing a degree of thoughtfulness, while the act of hammering his leather is calculated, as some

imagine, to stimulate the mental energy of the operative. If there be any real virtue in the sitting attitude of the shoemaker, a corresponding evil attends that method of carrying on his operations. In every profession, sitting at work in a close atmosphere is particularly injurious to health. Statistics assure us that out of 10,000 artisans who sit at their labor, 2,577 fall sick, and 95 die annually; while as regards an equal number of those who alternately sit and stand, only 1713 sicken and 61 die. To remedy this crying evil, a member of the profession, Mr. J. Sparks Hall, London, has invented a simple and inexpensive work-bench, at which shoes may be made standing. A few days practice, we are told, renders the workman as expert with the standing-bench as if he were seated according to the old plan, and he can execute closing with less fatigue and considerably more cleanliness. The only kinds of work at which sitting is more convenient are rounding the soles, lasting, and fitting. This standing-bench is, however, not much adopted by the men, who prefer old usages.

The fashion of shoes, as has occurred with other articles of dress, has undergone innumerable changes. At one time shoes were pointed to an extravagant degree; and in last century, the high heels of ladies' shoes became a monstrosity. Shortly after the beginning of the present century, the most marked improvement was the making of shoes right and left; the substitution of latches for buckles about the same period was also a step in advance. In our own day, the general disuse of the shoe proper, and the introduction of short ankle-boots, are the chief changes of fashion. A proposal for a more perfect adaptation of shoes and boots to the shape of the foot is noticed under Foot. The shoemaking trade, as at present conducted in Britain, is divided into two departments—the bespoke and the ready-made or sale business. The larger department hitherto has been that in which customers bespeak boots and shoes by having them made to measure; but it is generally giving way to the plan of buying articles ready-made. The cause of this is exceedingly obvious. The process of measuring is usually very imperfect, owing, among other reasons, to the want of lasts to suit every variety of feet, as well as the too general indifference to meet individual peculiarities. On this account, and even at the risk of purchasing an inferior class of goods, the public are becoming daily more disposed to encourage the ready-made trade. Accordingly large quantities of boots and shoes in innumerable varieties are now made and supplied wholesale by manufacturers for the retail dealers. Northampton, Stafford, and Leicester are considerable seats of this manufacture in England; and from certain districts in France, there are increasing importations, chiefly of a cheap kind of ladies' shoes.

The plan of making boots and shoes by isolated workmen at their own homes has been found quite incompatible with the modern necessities of trade. As in the case of the hand-loom weaver, the shoemaker of the old school has had to succumb to machinery. After an unsuccessful struggle to oppose the introduction of sewing machines, these are now coming generally into use, and men are employed in large numbers together in what may be called shoe-factories. Northampton and Stafford, the two chief of the centers just named, have unquestionably benefited by the introduction of the sewing-machine, although it deranged the relations between the masters and men for a time. An instructive and valuable exhibition of the leather and shoe trades was held at Northampton in 1873, illustrating the high pitch of excellence which these trades have now attained.

This manufacture has long been a staple trade of Massachusetts, in which state the quantity of boots and shoes fabricated annually is numbered by millions of pairs. Recently a machine has been introduced into the American shoe trade for fixing the soles to the uppers by means of pegs, the inventor being a person in Salem, Mass. A pair of boots or shoes can be pegged in two minutes. These pegged goods are disposed of wholesale in boxes, and may be seen in retail stores all over the United States. As evidence of the important character of the shoe-trade in Massachusetts it may be mentioned that a few years ago there were as many as fifteen members of the "gentle craft" in the legislature of that state. Ingenious machines have also been introduced for fastening the soles to the uppers by means of fine screws. They were shown at the international exhibitions of 1862 and 1867 at work uncoiling lengths of wire, making the end into a screw, cutting off a small piece, piercing a hole in the sole, and screwing the wire therein.

There are no means of determining the extent of this trade in England or the United Kingdom. All that can be done is to state the amount of imports and exports. The boots and shoes imported in 1876 were 109,906 doz. pairs, having a value of £328,540. These are entered among the customs tables as leather manufactures; but as very few boots and shoes are actually without leather, nearly all are probably included here. The exports in 1876 were 441,632 doz. pairs, value £1,403,466; of which 193,072 doz. pairs, value £614,509, were consigned to Australia. The export trade has varied as follows in recent alternate years:

	Dozen pairs.	Value.
1865.....	459,283	£1,462,105
1867.....	274,036	952,804
1869.....	436,829	1,326,799
1871.....	510,648	1,513,665
1873.....	526,460	1,704,145
1875.....	462,104	1,509,639

SHOES (*ante*). The making of shoes was one of the earliest industries introduced into the American colonies, the town of Lynn, Mass., being noted for its practice from the time of the landing of the pilgrims. A letter from London, dated in 1629, refers to the sending of "hydes" on board the *Mayflower*, to two shoe-makers, who settled in Lynn. In 1855 there were 4,515 male, and 11,021 female operatives engaged in Lynn in the manufacture of shoes, producing to the value of \$4,000,000, this being prior to the introduction of the use of machinery in the trade. In 1865, with the machinery then in use, 50 per cent more male and less than half as many female operatives produced double this value. In 1870 the production reached \$17,000,000. [The displacement of human labor in the shoe manufacture in the town of Lynn, by reason of the application of machinery, was 22 per cent in the case of the male, and 80 per cent in the case of the female, operatives.] The value of the shoe manufacture in Massachusetts, Maine, and New Hampshire in 1874 was set down at \$100,000,000; that of New York city at \$10,000,000. The importation of boots and shoes in 1874 amounted in value to less than \$50,000; and the exportation to less than \$450,000. The business of shoe-making was revolutionized in the ten years between 1861-71; the introduction of machinery which applied to every portion of the manufacture, having occurred within that period. The most important machines in use are the pegging machine; McKay sewing machine; Goodyear welt machine; cable-screw, wire, and wire-tacking machines, etc. The sale of stamps (royalty) of the McKay machine increased from \$38,746 in 1863 to \$529,973 in 1873; in 1874 there were 1200 of these machines in use in the United States.

SHOLA, the white pith of the leguminous plant *eschynomene aspera*, a native of the East Indies. With this substance, which is exceedingly light, the natives of India make a great variety of useful articles, especially hats, which, being very light and cool, are in great request. Helmets made of shola are much used by the British troops in India.

SIOMER, JEBEL, a province in central Arabia; pop. 162,000. It is a flat table-land, much of it desert with a few oases. On the e. border is a long valley called Wally Sirhan or Serhan, the common route for caravans to and from Syria. It contains the lake of Ittra, which supplies many of the adjacent provinces with salt. By means of artificial irrigation crops of grain, vegetables, and fruits are raised. A common article of export is ostrich feathers. There is considerable trade between Hayel and Medina. Horses, mules, and asses are exported. The capital is Hayel. It is in an extensive plain between Adja and Solma, inclosed by high mountains, and approached only by a narrow defile. Abdallah in 1818 made himself master of the whole district, and was succeeded by his son Telal in 1845, under whom it has become an independent sultanate.

SHOOTING, with intent to wound, is felony in the law of England, and punishable with penal servitude for life. The offense consists in shooting at another, or drawing a trigger, or in any other manner attempting to discharge loaded arms. It is not, however, an offense unless there was a possibility of injuring some person; the intent must not only exist, but the relative situation of the parties must be such that serious injury might have ensued. The extent of the actual wound is immaterial.

SHOOTING STARS. See AEROLITES; METEORS; *ante*.

SHORE. See SEA-SHORE.

SHORE, in ship-building, is a strong prop or stanchion placed under the bottom or against the side of a ship, to keep her steady on the slip or in dock. Shores are also used to support or prop up a building during alterations.

SHORE, JANE, 1445-1525; b. London; married a goldsmith of the name of William or Matthew Shore; mistress of king Edward IV., 1470, of lord Hastings, 1483. She received the offer of the hand of Thomas Lynom the king's solicitor, but Richard refused his consent. She was accused of witchcraft, and suspected of favoring the cause of the young princes. Openly charged with sorcery, by order of the duke of Gloucester, afterward king Richard III., she was committed to the Tower. Subsequently her property was confiscated, and she was sentenced by the bishop of London to do penance for her crimes. She lived until the accession of Henry VIII., and it is the popular belief that she died in penury and without a shelter.

SHOREDITCH. See TOWER HAMLETS.

SHOREHAM, NEW, a sea-port, and parliamentary borough of Sussex, on the left bank and at the mouth of the Adur, 6 m. w. of Brighton. The town arose when the harbor of Old Shoreham, now a m. inland, became silted up. Pop. of the parish '71, 3,678. Ship-building is carried on here on an extensive scale, and the trade of the port is considerable, principally with France and the coast. In 1875, 660 vessels, of 85,964 tons, entered, and 350 vessels, of 22,029 tons cleared the port. About 160 vessels belong to Shoreham, of which a large number are employed in the oyster-trade. The parliamentary borough, which includes the *Rape* (see SUSSEX) of Bramber, contains, '71, 37,984 inhabitants.

SHORT, CHARLES, LL.D., b. Mass. 1821; graduated at Harvard college in 1846; assistant teacher in Phillips academy in 1847; master of the Roxbury classical school,

1847-53, and of a private classical school in Philadelphia, 1853-63; professor of mental and moral philosophy in Kenyon college, Ohio, and its president, 1863-67; succeeded Dr. Dristler as professor of Latin in Columbia college in 1868. His publications are *Advanced Latin Exercises* in Schmidt's and Zumpt's classical series; *New Ancient Geography*, revised; an essay on the *Order of Words in Greek*. He has translated articles from German for Herzog's *Real Encyclopædia*, and his contributions to the *Bibliotheca Sacra* and other reviews are numerous. He is one of the American committee of revisers of the English Bible.

SHORT, WILLIAM, 1759-1849; b. Va.; educated at William and Mary college. In 1784 he was secretary of legation when Jefferson was minister to France. He was successively *chargé d'affaires* at Paris, minister at the Hague, and (1792-95) at Madrid. He was the first American citizen appointed to office under the constitution.

SHORT-HAND, a very useful art, by means of which writing is made almost as expeditious as speaking. In ordinary long-hand, many separate motions of the pen are required to form each single letter: thus *m* requires seven motions, *k* requires six, *h*, five, *t* four, *l* three, etc. But as syllables include vowels as well as consonants, and often two, or even three, and sometimes four consonants occur before or after a vowel, the number of motions requisite to write syllables in long-hand is very great. The monosyllabic words *long* and *short*, for instance, require respectively fourteen and seventeen motions of the pen; while such syllables as *stream*, *splints*, *strength*, etc., require from twenty-one to twenty-six motions. Abbreviated writing is thus a necessity in all cases where language has to be written from ordinary delivery. Some stenographers make use of the common alphabet, and merely contract words by the omission of letters. They would, for instance, write the last sentence thus:

So. stenog. ma. n. of th. com. alph. & me. contr. wo. by th. om. of let.

This is not properly *short-hand*; the latter term is limited to writing which is both abbreviated in spelling, and simplified in the forms of the alphabetic characters. Much attention has been paid to this art in Britain during the last 300 years, upward of 200 systems having been published within that period. The older systems were chiefly founded on orthography, the ordinary spelling of words being represented simply by a set of more convenient symbols for letters. The highest brevity attainable in this way was, however, altogether insufficient for reporting; and consequently, arbitrary signs for words and phrases, and distinctions in the value of characters, dependent on their relative position on, above, or below the line of writing, were largely used. The more modern systems have all been to a greater or less extent *phonetic*, or representative of sounds instead of letters, the number of sounds into which syllables may be resolved being considerably smaller than that of orthographic elements.

Of the two classes of elements, vowels and consonants, the latter are the more important for the recognition of words; and these are generally written without lifting the pen, vowels being supplied by dots and other interpolated symbols. In some systems no attempt is made to discriminate one vowel from another, but only the places where vowels occur are indicated by a general sign; in others the five vowel letters have distinctive symbols; and in others an accurate representation of the varieties of vowel sound is aimed at. The degree in which words are recognizable without vowels may be judged of by the following specimen:

Ch-mbrzz nselpd a deshr v nvrsl nlj fr th ppl n th bss v th lst dshn v th jrmn
cnvrsshnz lesen.

An indication of *where* vowel sounds occur—without showing *what* vowels—will be found to give increased and sufficient legibility to a reader who is acquainted with the language. Thus:

Ch-mb-rz-z -ns-cl-p-d- - a d-esh-n-r- -v -n-v-rs-l n-l-j f-r th- p-pl -n th- b-s-s -v th-
l-t-st -d-sh-n -v th- j-r-m-n c-nv-rs-sh-nz l-es-c-n.

Chambers's Encyclopædia, a Dictionary of Universal Knowledge for the People, on the basis of the latest edition of the German Conversations Lexicon.

Short-hand alphabets consist of simple straight and curved lines, to which hooks, loops, or rings are added. These elements of writing are common to all systems, but the powers associated with the symbols are, of course, different in different systems. Much ingenuity has been shown by various authors in developing the application of the simple radial and segmental lines of a circle, and the positions of a dot, for the representation of language; but, in many cases, while a wonderful amount of apparent brevity has been attained—as by writing on a staff of lines, each of which gives a different value to the same sign—the systems are all but impracticable, from the multitude of details with which the memory of the learner has to be burdened. The prevailing fault of such systems of short-hand is that they are long in being short. Reporters *must* abbreviate even the simplest possible form of alphabetic writing, but the mastery of a short-hand alphabet for other than reporting purposes is a very easy matter; and the acquisition will be found valuable in enabling a writer to save four out of every five motions of the pen in private memoranda, correspondence, etc.

A great impetus was given to the study of short-hand about 35 years ago by the pub-

lication of Mr. Isaac Pitman's *Phonography*. The introduction of the penny postage at the same period vastly aided the diffusion of the system, and societies for phonographic correspondence were established in all parts of the kingdom. The Psalms, the New Testament, and many other works, were published in the phonographic alphabet, and magazines written in short-hand found a widely diffused circle of supporters. This system of writing is elegant and expeditious to a practiced hand, and a very great improvement on all preceding systems. The alphabet consists of the following characters:

p	b	\\	r	\\
t	d		l	/
ch	j	//	m	—
k	g	—	n	—
f	v	((ng	—
th	dh	((<i>Duplicate forms.</i>	
s	z))		
sh	zh))	s	z
			r	/

The distinction between *breath* and *voice* (or *mute* and *sonant*) consonants, as above shown, is happily expressed by a thickening of the symbolic line for the latter elements. The characters in the second column are, however, anomalous, the first four, which are written "thin," representing voice consonants, and the fourth and fifth, written with the difference only of "thick" and "thin," representing distinct formations, which differ from each other as *d* does from *g*, and both of which are voice consonants.

In this system vowels are denoted by the interpolated signs—

placed at the top, the middle, or the bottom of the consonant lines. The vowel marks are written *thick* for "long," and *thin* for "short" sounds. The long and short vowels are not, however, phonetic pairs, differing only in quantity; and thus the vowel scheme is less accurate than that of the consonants. It is, besides, very complex to a beginner, from the employment of a special set of characters for vowels preceded by *w* and *y*, the latter elements not being included in the alphabet of consonants.

In "phonography," as in almost all other systems of short-hand, vowels are added by separate liftings of the pen, while their insertion is indispensable to legibility, unless special modes of writing consonant combinations are adopted. The latter expedient is employed by Mr. Pitman for such compounds as *pr*, *pl*, *spr*, *str*, *nl*, *mp*, etc., the characters for which make, practically, large additions to the alphabet. The use of a general vowel sign would evidently be of little advantage in this system, as it would, equally with the exact vowel marks, require the pen to be lifted for its insertion.

In a more recent system of phonetic short-hand, a new principle of writing is adopted, by which the positions of all sounded vowels are indicated in the writing of the *consonants*, thereby securing easy legibility, with brevity and simplicity, in the writing of a *known* language. This system, the invention of Mr. Melville Bell, is based on the following principles:

I. A full-sized character represents a consonant with a vowel sound *before* it.

II. A half-sized character represents a consonant with a vowel sound *after* it.

III. A tick-sized, or very small character, represents a consonant *alone*, and neither preceded nor followed by a vowel.

In this way, all words are distinguished to the eye, as monosyllables, dissyllables, trisyllables, etc., without any necessity for interpolated vowel points. The relative size of the letters *pt*, for example, forming the consonant outline of the words *pet*, *apt*, *pity*, *poet*, etc., shows the first pair of these words to be monosyllables, and the others to be dissyllables. Thus:

<i>pet</i>	tick <i>p</i> , full <i>t</i> .	} one syllable
<i>apt</i>	full <i>p</i> , tick <i>t</i> .	
<i>pity</i>	half <i>p</i> , half <i>t</i> .	} two syllables.
<i>poet</i>	half <i>p</i> , full <i>t</i> .	
<i>attack</i>	full <i>t</i> , full <i>k</i> .	
<i>active</i>	full <i>k</i> , tick <i>t</i> , full <i>v</i> .	} three syllables.
<i>capital</i>	half <i>k</i> , half <i>p</i> , tick <i>t</i> , full <i>l</i> .	
<i>appetite</i>	full <i>p</i> , full <i>t</i> , full <i>t</i> .	

The importance of this mode of writing will be at once obvious in such words as contain the same consonants with various syllabication, as *sport*, *sprite*, *spirit*, *support*, *separate*, *aspirate*, etc.

To a learner this system offers a very brief and easily read stenography of his own language, so soon as he has learned the alphabet only. The system is of course susceptible of the ordinary methods of abbreviation for the fleet exigences of the reporter, such as the use of letters for words, special positions for "logograms," etc. Exact vowel marks also are provided for insertion wherever they are considered necessary, as in the writing of foreign words, proper names, etc. The following is Mr. Bell's alphabet, as published in the *Reporter's Manual*:

k	g	\\	p	b	//
sh	zh-y	((f	v	((
h	r)	wh	w)
t	d		s	z	---
ch	j		m		(
l		(n)
th	dh)	ng		o

In this arrangement *all* breath consonants are written by thin lines, and all voice consonants by thick lines; and no additional characters are used for compound consonants. The essential principle of the system, by which the positions of vowels, or the absence of vowels, are indicated in the writing of the consonants, manifestly dispenses with the necessity for separate symbols for combinations.

The three different sizes of the alphabetic characters, which express the effect of vowels in this system, are employed with some specific value in all systems. In Mr. Pitman's *Phonography*, for instance, "half-sized" consonants are used to denote the addition of *t* or *d* to the consonant which is written; while the *vowel* symbols are in size precisely the same as the characters which, in Mr. Bell's phonetic shorthand, represent "tick-sized" consonants.

The vowel scheme of the latter system furnishes a separate sign for every difference of vowel quality, and the distinction of thick and thin symbols is limited to actual phonetic pairs of long and short sounds, such as are heard in the words *full* and *fool*, *yon* and *yawn*. But, except in monosyllables written in the first or simply alphabetic style, the distinctive vowel signs rarely require to be inserted.

As an illustration of the aspect of the writing in these two phonetic systems, the following sentences are written in the full alphabetic styles:

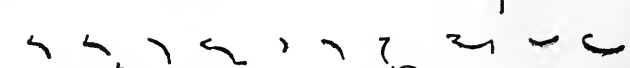

1. Be fit to live that you may be fit to die.

1. { PITMAN. 
BELL. 

2. He that cannot be silent knows not how to speak.

2. { PITMAN. 
BELL. 

3. Where words are scarce they are seldom spent in vain.

3. { PITMAN. 
BELL. 

4. Forgive and forget; do as you would be done by.

4. { PITMAN. 
BELL. 

The fundamental difference between these systems will be understood from the examples; in the first system, all syllabic sounds are definitely shown by means of vowel-points, but without these latter a reader could not distinguish the number of syllables contained in a word; in the second system, the consonant outline, without inserted vowels, informs the eye of the number of syllables in every word—all full as well as all half-sized consonants being necessarily syllabic.

Some systems of short-hand consist mainly of ideographic signs, alphabetic writing being used only as supplementary to the arrangement of arbitrary symbols and ruled lines. Thus the positions *upon*, *above*, or *below* a single line are associated with such meanings as *present*, *past*, and *future* for verbs; *affirmative*, *interrogative*, and *negative* for propositions; *personal*, *relative*, and *demonstrative* for pronouns, etc.; while the symbols for the various classes of words are merely uniform points, commas, hyphens, and other non-alphabetic marks. Sometimes the principle of different positional values of symbols is carried to so great an extent that the projectors of such systems are able to boast, paradoxically, that one-half of any speech is virtually written before the speaker opens his lips! The difficulty of attending in rapid writing to such niceties of position as have been prescribed, may be conceived from the following specimen of "dot" positions, extracted from Moat's *Shorthand Standard*:

Moat's system may be taken as the representative of this class. It is certainly the most elaborate and methodical—in fact, a marvel of ingenuity and perseverance—but, like other ideographic systems, it is so burdensome to the memory of a learner, as well as difficult in application, that it could never be of much use to any other person than the contriver.

In all systems more or less use is made of what may be called analogical symbols, such as a *circle* for the *earth*, the *world*, etc., with a point *above*, *below*, *before*, *after*, or *within* the circle, for such phrases as *above the earth*, *under the earth*, *in the world*, etc. But alphabetic writing by sound can derive little assistance from such arbitrary signs, however suggestive. Abbreviated phonetic writing undoubtedly furnishes the simplest and most exact method of stenography; and the two systems above exemplified sufficiently illustrate the nature of the art of shorthand, as most widely practiced on the phonetic basis at the present day.

Some of the older methods still find adherents. In fact, any system to which a writer is accustomed is better than longhand; and, practically, reporters and others modify for themselves the systems they employ. Fancutt's *Stenography on the Basis of Grammar* (1840) is a very ingenious work; and Jones's *Phonography* (1865), a modification of Pitman's, may also be referred to. A *History of Shorthand*, containing a chronological enumeration of authors, was published a few years ago. The reader who wishes to learn a good practical system of shorthand is referred to Pitman's *Phonographic Teacher* and other publications.

SHORT-SIGHT. See SIGHT, DEFECTS OF.

SHIOSHONE, a co. in n. Idaho, having the Bitter Root mountains for its e. and n. boundary, separating it from Montana; 3,000 sq.m.; pop. '80, 469—113 of American birth, 298 colored. It is drained by the n. fork of Clearwater river, and the s. fork, forming its s.w. boundary; Clarke's fork of the Columbia, the Oro Fino, and the Kootenay rivers. It contains lakes Cœur d'Alène and Pend d'Oreille, the shores of which are very fertile. The mountain slopes are covered with pine and cedar trees, and gold is found and exported. The value of the exports for one year was \$370,172. Co. seat, Pierce City.

SHIOSHONE, or SNAKE, RIVER. See IDAHO

SHOSHONES, or SNAKES, a family of North American Indians, inhabiting the territory between the Sierra Nevada and the Rocky mountains, the s. part of Idaho, and the n. of Utah. They are divided into the Shoshones proper, the Utes, Comanches, and six other tribes. The Shoshones proper include the Bannacks. They came from the s., and have been gradually drifting toward the Rocky mountains. The most important bands are the Koolsatikara or Buffalo eaters on Wind river; the Tookarika or Mountain Sheep-eaters, in the Salmon river valley, the Snake river valley, at Fort Boise, on Humboldt river, and on Goose creek. The Salt Lake Diggers were nearly exterminated in a battle on Bear river in 1862. In 1863 peace was made with most of the tribes, after years of open war, by gen. Augur at fort Bridger. They have been settled on different reservations, the Klamath, fort Hall in Idaho, at Wyoming, Nevada, and Utah. The Episcopalians have a mission at Wyoming.

SHOT is the term applied to all solid projectiles fired from any sort of firearms; those for cannon and carronades being of iron, those for small-arms, of lead. The latter are known as bullets and small-shot. The shot used for guns at present vary from the

3-pounder, for boat and mountain artillery, to the 13-in. shot, which weighs about 300 lbs. as a shell, or 700 lbs. as an elongated bolt. Generally, shot are cast. There are simple practical rules for calculating the weight of *spherical* shot from the diameter, and *vice versa*, which are often useful in reading of artillery actions. Given the diameter in inches, to find the weight in pounds: Cube the diameter, and multiply the result by 14; reject the two right-hand figures; those remaining give the weight in pounds.—Given the weight in pounds, to find the diameter in inches: Multiply the cube-root of the weight by 1.923, and the result is the diameter of the shot in inches.

Small-shot is of various sizes, from swan-shot, nearly as large as peas, to dust-shot. It is made by dropping molten lead through a colander in rapid motion from a considerable height into water. The lead falls in small globular drops. The holes in the colanders vary in size according to the denomination of the shot, No. 0 requiring holes $\frac{1}{16}$ in. in diameter, No. 9, $\frac{3}{16}$ inch. The colanders are iron hemispheres, 10 in. in diameter, and are coated within with the *cream* or *scum* which is taken off the molten metal. A small portion of arsenic is melted with the lead, and the fusion in the colanders is maintained by those vessels being surrounded by burning charcoal. The discovery of the advantage attending a long fall was made in England toward the end of last century. Previously the shot had dropped from the colanders at once into the water. The lead was then so soft that the shot were flattened by the water. The fall through the air enables the lead to cool and harden before taking its plunge. The smaller sizes require less fall than the larger—100 ft. suffices for sizes Nos. 4 to 9—the larger sorts demand 150 feet. The highest shot tower is at Villach, in Carinthia, where there is a fall of 249 feet. After cooling, shot is sifted in successive sieves to separate the sizes. Misshapen shot are found by their inability to roll; and finally, the whole are polished by rotary motion in small octagonal boxes, in which a little plumbago has been thrown. See also CASE-SHOT or CANISTER-SHOT, and GRAPE-SHOT.

SHOTTS, a small and ancient village of Lanarkshire, close to the Kirk of Shotts, about 16 m. e. of Glasgow. About 3 m. to the s.e. of the Kirk, modern Shotts, or Shotts proper, began to rise at the close of the last century, when the Shotts Iron company erected their extensive iron-works there. Shotts may be said to consist of three villages—viz., Stane, Shotts Iron-works, and Dykehead, of which the united population in 1871 was 2,719. In the same year the population of the civil parish of Shotts was 8,353. Valuable coal and ironstone, peculiarly suited for the manufacture of iron, abound in the district, and a large number of workmen are employed in iron-making and molding. Until recently there was no railway communication from and to Shotts for passengers; but since the opening of the Clelland and Midcalders branch of the Caledonian railway, Shotts forms the half-way station between Edinburgh and Glasgow on that line.

SHOULDER-JOINT, *TUE*, is a ball-and-socket joint. The bones entering into its composition are the humerus or arm-bone, and the scapula or shoulder-blade, the large globular head of the former being received into the shallow glenoid cavity of the latter, an arrangement by which extreme freedom of motion is obtained, while the apparent insecurity of the joint is guarded against by the strong ligaments and tendons which surround it, and above by the arched vault formed by the under surface of the acromion and coracoid processes. See *SCAPULA*. As in movable joints generally, the articular surfaces are covered with cartilage, and there is a synovial membrane which lines the interior of the joint. The most important connecting medium between the two bones is the capsular ligament, which is a fibrous expansion embracing the margin of the glenoid cavity above, while it is prolonged upon the tuberosities of the humerus below. From its relations with the surrounding muscles, the ligament derives much of its strength. Accordingly, in paralysis of the arm, one or two fingers can often be pressed into the joint toward the head of the glenoid cavity, from which the head of the humerus is now separated.

The shoulder-joint exhibits the following varieties of motion. 1. Flexion, to a great extent; 2. Extension, in a much more limited degree; 3. Adduction, in an oblique direction, forward and inward; 4. Abduction, very freely; 5. Circumduction; and 6. Rotation slightly.

The morbid affections of the shoulder-joint may be divided into (1) those arising from disease, and (2) those dependent on an accident. The most common diseases are acute and chronic inflammation of the joint, which often terminate in its ankylosis or immobility. The principal accidents are fractures and dislocations. There may be fracture (1) of the acromion process, or (2) of the coracoid process, or (3) of the neck of the scapula, or (4) of the superior extremity of the humerus; or two or more of these accidents may be associated. Again, the head of the humerus may be dislocated from the glenoid cavity as the result of accident in three different directions—viz. (1) Downward and inward into the axilla, which is by far the most common form; (2) Forward and inward; and (3) Backward on the infra-spinous fossa, or the dorsum of the scapula. The first of these varieties is of such common occurrence that persons of ordinary intelligence should know how to recognize, and even (in an emergency) to treat it. The following are the most prominent symptoms: "The arm is lengthened; a hollow may be felt under the acromion, where the head of the bone ought to be; the shoulder seems flattened; the

elbow sticks out from the side, and cannot be made to touch the ribs; and the head of the bone can be felt if the limb be raised, although such an attempt causes great pain and weakness from the pressure exerted on the axillary plexus of nerves."—Druitt's *Surgeon's Vade-mecum*, 8th ed. p. 282. There are at least five methods of treating this form of dislocation. It is sufficient to notice two of them. 1. Reduction by the heel in the axilla. The patient lies on a couch, and the operator sits at the edge and puts his heel (the shoe or boot being previously removed) into the axilla, to press the head of the bone upward and outward, and at the same time pulls the limb downward by means of a towel fastened above the elbow. 2. Reduction by the knee in the axilla. The patient being seated in a chair, the surgeon places one of his knees in the axilla, resting his foot on the chair. He then puts one hand on the shoulder to fix the scapula, and with the other depresses the elbow over his knee.—For a description of the symptoms and mode of treatment of the other forms of dislocation, and of the different varieties of practice, we must refer the reader to any systematic treatise on surgery.

SHOVELER, *Rhynchaspis*, a genus of ducks of the section having no lobe or pendent membrane on the hind toe, and remarkable for the expansion of the end of the mandibles in adult birds, particularly of the upper mandible. The lamellæ of the mandibles are long and very delicate. The legs are placed near the center of the body, so that these birds walk much more easily than many of the ducks. The common shoveler (*R. clypeatus*) is smaller than the wild duck, but rather larger than the widgeon. The shoveler is a winter visitant of Britain, but not very common. A few remain all the year. It is widely distributed over Europe, Asia, and North America. Its flesh is very highly esteemed. A species of shoveler is found in Australia.

SHOW-BREAD. See **SHEW-BREAD**, *ante*.

SHOWERS OF FISHES have occasionally fallen in different parts of the world, exciting great astonishment. Instances of this kind have occurred in Britain. A few years since, a shower of small three-spined stickle-backs fell near Merthyr-Tydvil in Wales, sprinkling the ground and house-tops over an area of at least several square miles. They were alive when they fell; yet if caught up by a whirlwind from any of the brackish ponds near the sea, in which this species of fish abounds, they must have been conveyed through the air a distance of almost thirty miles. Another similar instance occurred at Torrens, in the isle of Mull, in which herrings were found strewn on a hill five hundred yards from the sea, and 100 ft. above it.

Showers of fishes occur much more frequently in those tropical countries where violent storms, sudden gusts of wind, and whirlwinds are most common. In India, a shower of fishes varying from a pound and a half to three pounds in weight has been known to fall. Sometimes the fishes are living, more frequently they are dead, and sometimes dry or putrefying. They are always of kinds abundant in the sea or fresh waters of the neighborhood; and it cannot be doubted that they are carried up into the air by violent winds or whirlwinds; although they sometimes fall at a considerable distance from any water which could supply them. The sudden reappearance of fresh-water fishes in ponds which have been dried up for months in tropical countries, is often popularly ascribed to their falling from the clouds; but the truth is, that they have been buried in the mud below, existing probably in a state analogous to that of animals in cold climates during hybernation. A pool, the bottom of which has long been dry, and on which grass has grown and cattle have walked, is again filled with fishes in a few hours after it is filled with water.

SHRAPNELL SHELL. See **SHELLS**.

SHREVE, HENRY MILLER, 1785-1851; b. 'N. J. Capt. Shreve was one of the first to engage in steam navigation in the west, and for nearly 40 years was connected with the river commerce of that section. He was the inventor of the steam "snag-boat," and for several years held the position of U. S. inspector of western river improvements. In the war of 1812 he had charge of various fortifications on the Mississippi, and in the battle of New Orleans did effective service as capt. of artillery.

SHREVEPORT, a city in n.w. Louisiana, co. seat of Caddo parish, incorporated 1839; on the w. bank of the Red river, 20 m. below the Great Raft; 44 m. s.e. of Jefferson, Texas; pop. '80, 11,017. It is the e. terminus of the Texas and Pacific railroad, is connected with St. Louis by the all-rail route via Marshall, Texas; and regular lines of steamers run from this port to New Orleans, touching at points on the Red and Mississippi rivers. It is the first port of delivery e. of the Pacific on the line of the Texas and Pacific railroad. In the midst of the cotton-growing region it is an important cotton mart, shipping annually from 110,000 to 125,000 bales, sold to agents, and shipped on through bills to Liverpool and the east. Value of annual shipments, \$7,500,000; sales of merchandise, \$7,000,000. The shipments of cotton include 20,000 bales reshipped to go up the Red river. The surrounding country is productive and among the exports are hides, wool, tallow, and cattle. It contains many very handsome buildings, and a market costing \$50,000. It is lighted with gas, has a well-organized fire department, 3 private banks, 9 private and denominational schools and academies, 11 churches (5 for colored people), a Jewish synagogue, a marine and a charity hospital, 4 newspapers, and 4 public schools (2 each for colored and white pupils). It has 2 cotton compresses, and

manufactories of cotton-seed oil, iron, lumber, carriages, cotton gins, spokes and hubs, ale and beer. It has several street railways and a cotton exchange.

SHREW, *Sorex*, a genus of small quadrupeds of the family *soriculæ*. They are often popularly confounded with mice and rats, but are really very different, having insectivorous and not rodent teeth. The head is very long; the snout elongated, attenuated, and capable of being moved about; the eyes small; the tail long; both body and tail covered with fine short hair; the feet have a broad sole and 5 toes. The genus has recently been sub-divided, and the British species belong to more than one of the subdivisions. The COMMON SHREW of Britain (*S. or corsira vulgaris*) was, until recently, confounded with *S. araneus*, a species common in continental Europe. It is nearly $2\frac{1}{2}$ in. in length from the snout to the root of the tail, the length of which is about $1\frac{1}{4}$ inches. It abounds in dry fields, gardens, and hedge-banks; feeding chiefly on insects and worms, for which it grubbs with its long snout among the roots of the herbage. It burrows, and makes long runs just under the surface of the ground. It is an excessively pugnacious little animal, and the males have fierce combats in spring, in which many are killed. Cats kill the shrew, but do not often eat it, probably on account of its strong musky smell; but it is the prey of weasels, hawks, owls, and shrikes. Harmless and inoffensive as it is, it has long been very generally regarded with dread and aversion by the vulgar. (See White's *Natural History of Selborne*.)—Another and even smaller species, *S. pygmaeus*, is found in Ireland, where it is called the shrew mole.—The WATER SHREW (*S. fodiens* or *crossopus fodiens*) is larger than the common shrew, being fully 3 in. long, and the tail 2 inches. It is of a blackish-brown color, gray or white on the underparts. It burrows in the banks of streams, and is very aquatic in its habits. It is found in many parts of Britain.—Some of the Indian species of shrew attain a much larger size, as that called the musk rat (q.v.). There is an Italian species which is the smallest of all known mammalia. It is only about $1\frac{1}{2}$ in. in length, exclusive of the tail, which measures about 1 inch.

SHREW-MOLE, *Scalops*, a genus of insectivorous mammalia of the family *talpidæ*, and very nearly allied to the moles. There are 6 incisors, 2 canine teeth, 8 false molars, and 6 true molars in each jaw. The ear is destitute of auricle; the eyes are very small, and much concealed; the feet are 5-toed, the fore-feet large, as in the mole. The whole figure, and also the habits, resemble those of the mole.—There are several species, all natives of North America.

SHREWSBURY, a parliamentary and municipal borough and market t., the capital of Shropshire, stands on the Severn, by which it is nearly surrounded, 163 m. n.n.w. of London by the London and North-western railway. It is irregular in plan, contains many inferior houses, partly built of timber, but often of very picturesque appearance. In the modern quarters the houses are handsome and regular. Two bridges, the "English" and the "Welsh," cross the Severn, and connect the town with the suburbs of Abbey-Forgeate and Coleham on the e., and Frankwell on the west. To the n. is the other suburb of Castle-Forgeate. The town contains interesting remains of the ancient walls, the castle, two monasteries, and a Benedictine abbey. The remains of the abbey church now form the church of Holy Cross. There are other ecclesiastical edifices, a free school, with an income from endowment of £3,100 a year, and 22 exhibitions to the universities; a number of other important schools, institutes, hospitals, etc. The town and county hall, the public rooms, a handsome Greek structure, and the market-hall, erected in 1857-68, in the Italian style, are worthy of mention. Shrewsbury carries on manufactures of linen thread, canvas, and iron-ware, and there is a salmon-fishery on the Severn. The brawn and "Shrewsbury cakes" made here have long been held in esteem. The borough returns two members to the house of commons. Pop. '71, 23,406.

Shrewsbury, called by the Welsh Pengwern, was named by the Anglo-Saxons *Scrobbes Byrig*, and of this the modern name is a corruption. The town connects itself intimately with the history of the country from the 12th to the 17th century. It was taken by Llewellyn the great, prince of North Wales, in 1215, during the disturbances between king John and the barons; and in 1403 Henry IV. here defeated the insurgent Percies and their allies with great slaughter. It was taken by the parliamentarians in 1644.

SHRIKE, or BUTCHER-BIRD, *Lanius*, a genus of birds of the family *laniadæ* (q.v.), approaching more nearly in character to the *falconidæ* than any other of that family; having a short, thick, and compressed bill, the upper mandible curve, hooked at the tip, and furnished with a prominent tooth, the base of the bill beset with hairs, which point forward. The species are numerous, most of them natives of warm climates, although some occur in the more northern parts of the world. They prey on insects and small birds, and have a remarkable habit of impaling their prey on thorns; so that the nest of a shrike may be discovered by the numerous insects impaled in the neighborhood of it. Shrikes kill and impale many insects which they never eat, leaving them to dry in the sun; and in confinement they make use for this purpose of a nail, if provided with it, or stick portions of their food between the wires of the cage. They can imitate in some degree the notes of many birds, particularly those which are the utterance of distress, and they seem to make use of this power in order to attract birds within their reach. The most common British species, rarely seen, however, except in the s. of Eng-

land, is the **RED-BACKED SHRIKE** (*L. colluris*), a bird only about $7\frac{1}{2}$ in. in length, about a third of the length being formed by the tail, which is square at the end. Insects are the chief food of this bird, but it also preys on small birds, young frogs, and even young pheasants.—The **GREAT GRAY SHRIKE**, or **SENTINEL SHRIKE** (*L. excubitor*), is about the size of a thrush. It is a rare bird in Britain, but common in some parts of Europe, and is found also in Asia and North America. It was formerly used by falconers in catching hawks, of which it is greatly afraid, screaming loudly on their approach; the falconer waited in concealment, after fastening some pigeons and a shrike to the ground, until the scream of the shrike gave him notice to pull the string of his net.

SHRIMP, *Crangon*, a genus of crustaceans, of the order *decapoda*, suborder *macroure*, and family *crangonide*, allied to lobsters, crayfish, and prawns. The form is elongated, tapering, and arched as if hunch-backed. The claws are not large, the fixed finger merely a small tooth, the movable finger hook-shaped. The beak is very short, affording a ready distinction from prawns. The whole structure is very delicate, almost translucent; and the colors are such that the creature may readily escape observation, whether resting on a sandy bottom or swimming through the water. The quick darting movements of shrimps, like short leaps, however, betray them to any one who looks attentively into a pool left by the retiring tide on a sandy shore. When alarmed, they bury themselves in the sand, by a peculiar movement of their fanlike tail fin.—The **COMMON SHRIMP** (*C. vulgaris*) is very abundant on the British coasts, and very generally elsewhere on those of Europe, wherever the shore is sandy. It is about 2 in. long, of a greenish-gray color, dotted with brown. It is in great esteem as an article of food, and is generally taken by nets in the form of a wide-mouthed bag, stretched by means of a short cross-beam at the end of a pole, and pushed along by the shrimper wading to the knees. Sometimes a net of larger size is dragged along by two boats. The supply of the market with shrimps affords employment to a great number of people.—The other species of shrimp seem to be equally fit for the table. Several are occasionally taken on the British coasts, but belong rather to more southern climates. Shrimps are very interesting inmates of the aquarium.

SHROPSHIRE, or **SALOP**, a frontier county in the w. of England, bounded on the w. by north Wales, and on the e. by the counties of Stafford and Worcester. Area, 841,167 acres; pop. '71, 248,111. The Severn, the principal river, enters the county from Montgomeryshire, about 12 m. w. of Shrewsbury. It pursues a generally s.e. course of 70 m. across the county, is navigable throughout, and is joined by two considerable tributaries, the Tern and Teme. To the n. and n.e. of the Severn, the county is generally level, and is under tillage; to the s. and s.e., it is hilly and mountainous, and here cattle-breeding is extensively carried on. A breed of horned sheep is peculiar to this county. More than three-fourths of the whole acreage are arable, or in pasture and meadow. The soil is generally fertile and well cultivated, though there are still extensive tracts of waste land. Shropshire is remarkable for its mineral wealth. The coal, iron, copper, and lead fields of Coalbrookdale, Snedshill, Ketly, etc., are very productive. Several thousand persons are employed in raising coal, iron, stone, and lime, and in the iron manufacture. The county returns four members to the house of commons. Capital, Shrewsbury.

SHROUDS are very strong ropes passing from the heads of the lower masts in a ship to the chains or channels on her sides, for the purpose of affording lateral support. They are crossed by thinner ropes, called ratlines, to form steps or ladders. The top-mast shrouds in ship rigged vessels are similar, except that they terminate in a row of dead-eyes on the outside of the tops.

SHROVETIDE (Anglo-Saxon *scrifan*, to shrive, to confess), literally means "confession-time," and is the name given to the days immediately preceding Ash-Wednesday, which, as indeed the whole period after Septuagesima Sunday appears to have been, were anciently days of preparation for the penitential time of Lent; the chief part of which preparation consisted in receiving the sacrament of penance, i.e., in "being shriven," or confessing. In the modern discipline of the Roman Catholic church a trace of this is still preserved, as, in many countries, the time of the confession, which precedes the paschal or Easter communion, commences from Shrovetide. These days were sometimes called fasting-tide or fast-mass, names which are still retained among the population in some parts of Great Britain. The name of Shrovetide was retained in England after the reformation, although the practice of "shriving," in which it had its origin, was abandoned. The precept of "shriving" having been fulfilled, the faithful, upon the eve of entering upon the Lent, were indulged with permission to give themselves up to amusements, and to festive celebrations, of which the counterpart is still seen in the continental carnival. In England the pastimes of foot-ball, cock-fighting, bull-baiting, etc., were, down to a late period, recognized usages of Shrovetide; and the festive banquets of the day are still represented by the pancakes and fritters from which Pancake Tuesday took its name, and by the "collops" which gave its title to Collop Monday. These usages are gradually disappearing.

SHRUB (see **SYRUP**), a kind of liqueur made chiefly in the West Indies. It consists of lime or lemon-juice and syrup, to which a small portion of rum is added; other flavoring materials are used occasionally.

SHRUBS are plants with woody stem and branches like trees, but of smaller size, not generally exceeding 20 ft. in height, and branching near the root, so as to have no main stem of considerable height. When a shrub is of small size and much branched, it is often called a *bush*. There is no more important botanical distinction between trees and shrubs, and the same genus very often includes species of both kinds. Many shrubs, as honeysuckle, are climbers.

In point of law, whoever plants a shrub thereby makes it a part of the soil, and it becomes a kind of fixture, incapable of being removed by tenants. But if the tenant is a nurseryman, who makes a business of planting and removing shrubs, it is otherwise. Whoever unlawfully and maliciously cuts, breaks, barks, or roots up a shrub growing in a pleasure-ground, garden, or ground adjoining a dwelling-house, if the injury exceed one pound in value, is guilty of felony, and liable to penal servitude for three years; and wherever the shrub is situated, if the damage amount to one shilling, the person is liable to be imprisoned or fined by a justice of the peace.

SHUBRICK, WILLIAM BRANFORD, 1790-1874; b. S. C.; studied at Harvard, but left to enter the navy, 1806. He served in the war of 1812, on the *Hornet*, on the frigate *Constellation*, and on the *Constitution*, of which he became second in command in 1815. He was promoted commander in 1820, and capt. in 1831; was in command at the Norfolk, Va., navy-yard, 1840-43, and was appointed chief of the bureau of provisions in 1844. He commanded the Pacific squadron during the Mexican war, was made chairman of the bureau of construction in 1853, and commanded the Brazil squadron in 1858. Returning in 1859, he again became chairman of the light-house board, to which he had been appointed in 1852. He was made senior member of the advisory board, and rear-admiral in 1862.

SHUFELDT, ROBERT W., b. N. Y., 1821; entered the navy as midshipman, 1839. At the beginning of the rebellion he was a 1st lieut., but was then consul-gen. to Cuba; in 1862 he was made commander. He was prominent in the defenses of Charleston and had command of several ships. After the close of the war he was with the East Indian fleet, 1865-66, with that of the Mediterranean, 1871-73, and in 1875 was made chief of the bureau of equipment and recruiting.

SHUGSHUT, a small t. of Turkey in Asia, in Anatolia, on the left bank of the Sakaria, 95 m. in direct line s.e. of Constantinople. On an adjacent hill is the tomb of Othman (q.v.), founder of the Ottoman dynasty. The tomb, resembling the handsomest and most ancient of the Turkish sepulchers at Constantinople, stand amid a grove of cypresses and evergreen oaks. Pop. estimated at about 8,000.

SHUMALA'RI. See HIMĀLAYA.

SHUMLA, a city of Bulgaria, about half-way along the line of railway which connects Rustchuk and Varna, and 60 m. s.s.w. of Silistria. It is bounded on the n. and w. by mountains, and on the s. and e. by an undulating plain furrowed by valleys that extend n. to the Danube. Its situation is pleasing, and the character and distribution of its buildings give it a picturesque appearance. The roads from the former Turkish fortresses on the lower Danube and in the Dobrudscha on the n., and from the passes of the eastern Balkan on the s., converge upon Shumla, and from this reason it is an important strategic position. Under the Turkish sway, Shumla was one of their most important strongholds, with very strong and extensive fortifications, and possessed a citadel, arsenal, capacious magazines, large and numerous barracks, and a military hospital. The plain around was also studded with detached forts. In Shumla are nearly 40 mosques. Wine and silk are largely produced; there are manufactures of copper, tin, and leather. The inhabitants during the Turkish supremacy were estimated at about 20,000, and were for the most part Turks or Mohammedans. Shumla was attacked in vain by the Russians in 1774, in 1810, and in 1823. The congress of Berlin, which established Bulgaria as an autonomous principality in 1878, resolved that the fortifications of Shumla and other Bulgarian towns should be destroyed.

SHUNT SYSTEM OF RIFLING is a very ingenious arrangement for securing the accurate centering of a projectile discharged from a rifled canon. To obtain precision of aim and range, it is absolutely essential that the axis of a projectile should, at the moment of discharge, coincide exactly with the axis of the bore. This can scarcely be obtained unless the shot fits with extreme tightness into the gun; and if it does so, and the gun is a muzzle-loader, it is scarcely possible to load it. The ordinary principle has the projectile smaller than the bore, so as to pass readily into the gun, resting, of course, on the bottom of the bore. The projectile is covered with a soft metal, as lead, which expands with the pressure behind, and fits the shot tight into the grooves; but from the fact that it rested (at the commencement of the expansion) on the bottom of the bore, the axis of the shot is always below the axis of the bore. To obviate this, sir William Armstrong designed the "shunt" system, which in practice has been found admirably effective. In rifling the gun, the groove for 14 in. from the muzzle consists of a wide, deep indentation (b in fig. 1), and at the side of it a narrow indentation of less depth a ; from 14 in. to 22 in. from the muzzle, this narrow groove gradually deepens, till it

attains the level of the broad groove, after which they run together for a short distance, until a shunt at *c*, fig. 1 narrows the whole groove on the same side as *a* to the original width of *b*. Projecting from the shell is an iron flange too high to pass the narrow groove, and still higher by its side, a narrow band of zinc or of brass studs. Each of these passes freely along the broad deep groove of the bore. As the shot is rammed home, the twist of the rifling brings the iron flange against the edge *d* (fig. 1) of the broad deep groove, which enables both the flange and zinc band to pass freely until past *f*. (fig. 1.) where the inclined plane ends. At *c*, however, where the groove becomes narrowed to only the width of the flange and band together, the shot is shunted over to the left. In this position it is rammed home. In coming out, of course, the pressure of the twist is reversed, and the zinc band presses against the straight edge *e*; on reaching *f*, the force of the exploded powder behind drives the shot on, while the inclined groove from *f* to *g* flattens down the zinc band, so that the projectile ceases to lie on the bottom of the bore, and is firmly centered by its several bands on the shallow grooves (whatever their number may be) round the bore's circumference. The lead fitting at the back of the shot has been meanwhile driven by the explosion into the deep wide grooves, so as to stop windage.

Fig. 1.

The Russians have a shunt system borrowed from sir W. Armstrong's, but differing in details. American guns, on similar principles, have been made experimentally. The invention does not appear to have been yet applied to small arms.

There is only a minute difference between the diameters of bore and projectile.

SHURTLEFF, NATHANIEL BRADSTREET, 1810-74; b. Boston, Mass.; son of Dr. Benjamin, graduate of Harvard university, 1831; of the medical school, 1834; commenced practice at Boston; mayor of Boston, 1868-70. He was learned in the sciences, an accurate genealogist, and a close and careful student of history. Notwithstanding that he claimed descent from 11 of the pilgrims of Plymouth, he was a devoted Roman Catholic. He was a contributor to the *Genealogical Register*, and edited the *Records of the Governor and Company of Massachusetts bay*, 1628-86, 6 vols.; and, with David Pulsifer, a publication from the MSS. of Nathaniel Morton, called the *Records of the Colony of New Plymouth*, 12 vols. He was author of several historical works.

SHUSHA, or SCHUSCHA, a fortified t. of Russian Transcaucasia, in the government of Elizabetpol, and 120 m. s.w. of the town of Schemacha. It was founded by Nadir shah, and occupies a strong position on a mountain, accessible only on one side. Pop. '67, 19,341.

SHUSTER, a city of Persia, in Khuzistan, on the Karun, 30 m. e.s.e. of Dizful, at the foot of a range of sandstone hills. In the early part of the present century, it was an important town and the capital of the province; but it was nearly depopulated by an epidemic in 1832, and was much damaged by an inundation in 1840. On a height stands the castle, commanded however, by a loftier elevation. The walls have been allowed to fall, and a fourth part of the town is in ruins. Customs are collected here, but the trade is not extensive. Pop. about 8,000.

SHUSHWAPS. See KOOTENAI8.

SHUTE, SAMUEL, 1659-1742; b. London; educated at Leyden. He served under Marlborough in Flanders, and was governor of Massachusetts, 1716-23. During his term he had a dispute with the legislature, who refused to fix his salary and denied his right to negative the speaker.

SHUTTLE, the instrument used to carry the weft-thread in weaving. See LOOM.

SHYENNE, a co. in s.w. Dakota, unorganized. It is drained by the Shyenne river, White river, and Bad river. Its surface is mountainous, containing a portion of the Black Hills which created the gold excitement in 1875-76, and part of the Bad Lands near the South fork of the Shyenne, celebrated for wonderful exhibition of fossil bones, and petrified wood, although the surrounding country has every element of fertility. The name of Bad Lands originated with the Indians, and has since been construed without reason, to mean barren lands.

SIALOGOGUES are substances which, by local stimulating action, increase the secretion of saliva. Among the substances which thus act as direct stimulants to the salivary glands (q.v.), we may especially mention horse radish root, mezezon bark, and pellitory root. Horse-radish root when chewed, produces a copious flow of saliva, and has been found useful in aiding deglutition in cases of paralysis of the tongue. If mezezon bark is used in the same way, the saliva should be frequently ejected, in consequence of the acrid properties which it absorbs from the drug. Pellitory root is the best of this class of remedies. Fragments weighing from half a dram to a dram may be frequently chewed when we wish to increase the flow of saliva in cases of facial neuralgia, rheumatism of the muscles of mastication, and paralysis of the tongue.

SIAM' (native name *Thái* = the free, or *Muang Thái* = the kingdom of the free), the chief state of Indo-China, is bounded on the s. by the gulf of Siam and the Malay peninsula. On the w., n., and e., the frontier-line is ill-defined and fluctuating, owing to many tribes being only partially under subjection, and to the constant wars of aggrandizement between Siam and the Malayan and Burmese races on the w., and the Cambodian and Cochinese races on the east. According to a recent account, the country lies in lat. 4° to 21° n., long. 96° to 102° e.; is 1200 m. in length, and about 350 m. in extreme breadth. Area estimated at from 190,000 to 290,000 sq. m.; pop. stated at from 6,000,000 to 10,000,000. The kingdom consists of 41 provinces, each governed by a phraya, or functionary of the highest rank. There are numerous districts beyond the limits of the kingdom proper, as the Laos, Malayan, and Cambodian dependencies, which are more or less under subjection to Siam, and pay tribute generally once in three years. Siam itself pays tribute to China, but only as a matter of usage and convenience, for it receives from that country more than a return, in the remission of duties upon Siamese vessels bound to Chinese ports. Cambodia is situated between Siam on the w. and Cochinese-China, and as sovereignty over it is claimed by both these countries, and as it is too feeble to resist the claims, it pays tribute to both.

Surface, Hydrography, Coast-line, Soil, and Climate.—The mountains which cover the northern districts of the country, and form natural barriers along its e. and w. frontiers, are branches of the great system of the Himalaya. Though the northern dependencies of Siam are mountainous, the kingdom proper is a vast plain, which only becomes hilly on its northern frontier. The great river of the country, the Nile of Siam, is called by foreigners Menam, or more commonly Meinam; but the Siamese call all rivers by this name, and distinguish the river by adding to the name Menam the name of the chief town or village on its banks; thus Menam Bangkok is the river of Bangkok, that is, the great river of the country, which Europeans and other foreigners have agreed to call Meinam. This river, the great life-sustaining artery of the country, rises among the mountains of the Chinese province of Yunnan, whence it flows s., and after a course of more than 800 m. in this direction, throws itself by three mouths, which are from 6 to 8 fathoms deep, into the gulf of Siam, about 30 m. (18 m. in direct line) below Bangkok. It receives a number of important affluents, notably the river Phitsalok, which joins it in lat. about $17^{\circ} 35'$ n. The annual inundation of the Meinam, the occasional non-occurrence of which entails failure on a great portion of the rice crops, commences in June and ends in November. Impregnated with the rich soil which it brings from the interior, its waters in August overflow the banks to a height sometimes exceeding 6 ft. above the ordinary level. The tract of country within the direct influence of the inundations is estimated at 12,000 sq. m.; but, properly speaking, the actual valley of the Meinam, commencing 450 m. above the mouth of that river, and with an average breadth of 50 m., has an area of upward of 22,000 sq. m., and forms a tract of country the fertility of which is not exceeded in any other quarter of the globe. Of the other great rivers, the chief is the Mei-kong, which flows through the eastern districts of the empire, and is said to be 1600 m. long. The coast-line fringing the edge of the gulf of Siam may be roughly estimated at 1100 m., exclusive of minor windings. The principal ports on the coast-line are Paknam (pop. 6,500), defended by three forts; Paklat, a few miles above Paknam (pop. 7,000), defended by a fort on each side of the river; Meklong, at the mouth of the river of the same name, long. $100^{\circ} 10'$ e., a beautiful city, with floating bazaars, fine pagodas and gardens, and a pop. of 10,000; Chantaburi, long. about 103° e., near the mouth of a river which, though short, fertilizes with its inundations a considerable district, a place of active trade with China and Cochinese-China, with a pop. of 6,000; and Bangplasoi, 27 m. e.s.e. of Paknam, engaged in a profitable fishery and in agriculture, pop. 6,000. The breadth of the Malayan peninsula, in lat. 11° n., is only 50 m., and here two streams, the one flowing w. to the bay of Bengal, and the other e. to the gulf of Siam, offer great facilities for the construction of a ship-canal, for their sources being near each other, a few miles of canalization are all that would be required to connect them, and thus form a sea-way across the peninsula, which would shorten the voyage between India and eastern Asia by many days, and often by weeks.—The climate of Siam is, for a tropical region, salubrious; the resident missionaries speak highly in its favor. The mean temperature at Bangkok for a series of eight years was $81^{\circ} 14'$; the maximum heat within the same space was 97° , and the minimum 54° . Hurricanes and typhoons are almost unknown in Siam, though it is visited every year by the s.w. and n.e. monsoons—the former bringing clouds, thunder-storms, and rain, the latter bringing refreshing weather.

Agriculture, Flora, and Fauna.—In Siam, few of the instruments in use in scientific agriculture are known, and in many parts of the country, in 1855, the ground was prepared for the seed by turning herds of buffaloes into the fields to trample down the weeds and move the soil, and afterward by harrowing the ground with thorny shrubs. But the soil here is so rich that the smallest outlay of capital and labor is rewarded by abundant harvests. A much more advanced system of agriculture, however, has been introduced within recent years, and the quantity of agricultural products exported has greatly increased. Rice and sugar are the principal crops. Of the other products, the chief are *agalla*, or eagle-wood, renowned for its perfume, and extensively used on that account at funerals, marriages, and other ceremonies in eastern Asia; gutta-percha,

cardamoms, gamboge, bamboo, the rattan, valuable palms, the guava, mango; daurien, esteemed the king of fruits in Siam; the mangosteen, and many other fruits and other trees, including teak and a variety of valuable ship and house timbers. Among the animals, the most famous is the elephant, which abounds in the forests. It is against the law of Siam to kill elephants, as these animals are considered the property of the king; but many of them are nevertheless slain for the sake of their tusks. A variety of this animal, said to be peculiar to Siam, is the white elephant, which is not really white, but of a light mahogany color. This animal is held in the highest veneration, the cause of which is that he is "supposed to be the incarnation of some future Buddha, and will therefore bring blessings on the country which possesses so great a treasure." He is fed upon fresh grass, and sugar-canes and plantains, served in rich dishes, is covered with ornaments, inhabits a building attached to the palace, enjoys the rank of nobility, and is tended by a staff of officers, guards, valets, etc. Tigers abound, especially in the Laos country in the n.; tiger-cats, rhinoceroses, boars, wild pigs, elks, and deer of many kinds, tenant the woods. Crocodiles, lizards, and serpents of various kinds are numerous. Excellent fish are found on the coasts and in the rivers.

Minerals.—Gold is found among the mountains, and silver in combination with other metals; copper, tin, lead, and iron are abundant, and are extensively worked by the Chinese. Precious stones are found in great number and variety.

Manufactures.—Vases, urns, and other vessels, in the manufacture of which gold is embossed upon silver, are made here in great numbers, and have an oriental celebrity. Gold-beating, iron-founding, and manufactures of fine cloth, glass wares, and pottery are carried on.

Commerce, Exports, and Imports.—In former times, Bangkok (q.v.), the capital, was the most commercial city e. of the cape of Good Hope, after Calcutta and Canton, and 60 British ships were engaged in trade with the river Meinam. But in 1855, such had been the influence of bad legislation, and such the destructive progress of monopoly, that the foreign trade had become reduced almost to nothing. Sir John Bowring, her majesty's plenipotentiary, arriving in Siam, negotiated a treaty of friendship and commerce with the Siamese rulers (signed at Bangkok, April, 1855), which provides that British subjects are permitted to trade freely in all the sea-ports of Siam, may purchase lands, houses, etc., and may profess the Christian religion undisturbed. By this treaty all monopolies are rescinded, British traders purchasing directly from the producer, and selling directly to the purchaser, without the interference of any third party. Export duties are levied upon all goods that leave the country, but they pay one impost only, whether this be levied under the name of inland-tax, transit-duty, or duty on exportation. Prior to 1856, when the treaty first took effect, the British arrivals (including Mussulman vessels under the British flag) amounted to only 12 per annum; in 1855 they amounted to 81 vessels; and in 1875 the entries at the port of Bangkok, which is the center of the foreign trade of Siam, included 211 British vessels, of 110,625 tons, and the clearances included 204 British vessels, of 107,789 tons; but the trade with Britain is of a very fluctuating character. The total exports in 1875 amounted to £1,755,711, and the total imports amounted to £1,329,841. In 1875 the chief articles exported were rice and sugar, and the principal imports of British goods were iron and machinery. These statistics are for the port of Bangkok alone. No statement can be given of the revenue and expenditure; but judging from the quantity of duty-paying goods exported, it may be supposed that the former is satisfactory.

Inhabitants and Government.—The Siamese proper, that is, the Tháí race, form about a third of the entire population. "They are gentle, timid, careless, and almost passionless." They differ in several respects from many eastern nations. Lying, though frequently resorted to as a protection against injustice and oppression, is not a national characteristic. The Siamese are inclined to be idle, inconstant, and exacting; but they are sincere, very affectionate in their domestic relations, witty in conversation, and, like the Chinese, expert in mimicry. About a third of the whole population are Chinese, who are great emigrants, but who, wherever they go, preserve their own language, customs, costume, habits, and social organization. There are, it is estimated, 1,500,000 Chinese in Siam; in Bangkok alone there are 200,000. All the active business of the country is in their hands. The Laos people (see SIAM STATES) are also very numerous in the country, and there are considerable numbers of Malays and Cambodians. The religion of the Siamese is Buddhism (q.v.), which inculcates the highest veneration for life in whatever form. A Siamese will not kill vermin or serpents; and the tameness of many creatures that in Europe flee from the presence of man is observed by all strangers. The use of betel (q.v.) is almost universal in Siam. All the belles of Siam stain their teeth black. The Siamese are extremely ceremonious in their intercourse one with another. An inferior crouches and crawls on the ground before a dignitary, and speaks of himself as "your slave—a hair—a little beast." They are a small well-proportioned race, with olive-colored skin, and black hair, of which all that they allow to grow is a tuft about two inches long on the top of the head—the rest being shaven off. They are remarkably fond of jewelry and ornaments, and the dresses of the higher functionaries and nobles is splendid and beautiful. They are fond of music; have a number of good native instruments, as well as the common European ones, and are skillful performers.

The government is an absolute and hereditary monarchy, and there are two kings. The first king is the actual monarch; the second king, who receives about one-third of the revenue, and has an army of 2,000 men, seems to occupy the place of first counselor, and is invariably consulted by the first king before any decisive step in the administration of affairs is taken. The present first king, Phrabat Somdetja Phra Paramithara, was born in 1823, and ascended the throne on his father's death, Oct. 1, 1868. The second king, Kroman Bawarawichai Chau, son of the last named, succeeded his father in 1868. Since a decree of 1874 the king shares the legislative power with the supreme council of state and with his cabinet or senabodi.

History.—The annals of the Siamese begin about five centuries B.C. But nothing authentic is known of the history of the country till 1350, in which year Ayuthia, the former capital, was founded. Cambodia was first conquered in 1532, and in this century the Siamese dominion extended to Singapore. The present dynasty ascended the throne in 1782. There have been numbers of Protestant and Catholic missionaries in Siam since the year 1828, but so far as the Siamese are concerned, their labors have been almost if not altogether fruitless. For further information on this most interesting country and people, see Bowring's *Siam* (Lond. 1857.)

SIAM, GULF OF, an important arm of the Chinese sea, is bounded on the n. and w. by Siam, on the s.w. by the Malay peninsula, and on the n.e. by Cambodia. At its entrance between Cambodia point and the peninsula of Patani on the Malay peninsula, it is 235 m. wide, and from the line drawn between these two points it extends inland in a n.w. direction to the mouth of the Meinam, a distance of 450 miles. Four great rivers, navigable to a considerable distance from their mouths, and the chief of which is the Meinam (see **SIAM**), fall into the gulf. It is unvisited by hurricanes of any kind, and shipwrecks here are very rare.

SIAMESE TWINS, a name given to two youths, Eng and Chang, born of Chinese parents in Siam, in 1811, having their bodies united by a band of flesh, stretching from the end of one breast-bone to the same place in the opposite twin. The survival to advanced life of such a *lusus nature* makes this one of the most remarkable cases on record. A union of the bodies of twins by various parts is not an unusual occurrence (see **MONSTROSITY**). Ambrose Paré has depicted instances of union by the back, belly, and forehead. The last occurred in two girls, who lived to the age of ten years, when one of them dying, a separation was made; the wound of the living girl assumed a bad character, and soon proved fatal. The Hungarian sisters, who lived about a century since, were united by the back, had one passage from the intestines, and each had one from the urinary organs. They died when they were 22 years of age. The Siamese twins were purchased of their mother at Meklong, a city of Siam, and were brought to America by capt. Coffin and Mr. Hunter in 1829. On examination, the connecting band seemed to have united them at first face to face, but constant traction had so changed its direction, that they stood partially side by side. Its length above was about two in.; below, nearly four; from above downward, it measured three in.; and its greatest thickness was one and a half inches. It was covered with skin, and when the center was touched, both felt it; but on touching either side of the median line, only the nearest individual was sensible of it. The connection between the Siamese twins presented many interesting points in regard to physiology and pathology, for although they formed two perfectly distinct beings, they appeared most frequently to think, act, and move as one individual.

After realizing a competence by the exhibition of themselves in the various countries of Europe, the Siamese twins settled in one of the southern states of America, where they were married to two sisters, and had offspring. Owing to domestic quarrels, however, two houses were found necessary, each living with his wife a week at a time alternately. Ruined by the civil war in America, the Siamese twins again made the tour of Europe and exhibited themselves to the public. They died in 1874, the one surviving the other an hour or two only.

For a full account of the structural peculiarities of such cases, see St. Hilaire's *Histoire des Anomalies de l'Organisation d'Homme et des Animaux*.

SIARA, properly, Ceara (q.v.).

SIBBALD, Sir ROBERT, an eminent Scottish naturalist, b. at Edinburgh, April 15, 1641, of a good family (the Sibbalds of Balgonie, in Fife), studied at the high-school and university of Edinburgh, and afterward pursued his medical studies at Leyden, Paris, and Angers; settled as a physician in Edinburgh in 1662, devoted much time to botany and zoology, and aided sir Andrew Balfour in establishing a botanic garden in Edinburgh. Having inherited an estate, he retired from medical practice, but continued his scientific pursuits; was appointed by Charles II. his majesty's geographer for Scotland, and was encouraged to prepare a work on the geography and natural history of his native country. His death is supposed to have taken place in 1722. He published many pamphlets on medical subjects, natural history, Scottish history, antiquities, etc. The work for which he is now chiefly remembered is his *Scotia Illustrata, sive Prodromus Historiæ Naturalis*, etc. (fol. Edin. 1684), a work of great merit for its time, but his *Collection of Several Treatises in Folio Concerning Scotland, as It was of Old, and also in Later Times* (Edin. 1739), is not without value.

SIBERIA, a vast territory in northern Asia, belonging to Russia. In England the name is generally applied to all the Russian possessions in Asia, with the exception of the Transcaucasian and Armenian provinces. Siberia so defined is bounded on the n. by the Arctic ocean; on the e. by the seas of Kamchatka, Okhotsk, and Japan, all of them arms of the Pacific ocean; on the w. by the Ural mountains, Ural river, and Caspian sea. The southern boundary is made to include the recent Russian acquisitions in Turkestan, runs from lake Issyk Kul, n.e., then eastward by Kiahia to the Argun river, which it follows to the Amur; the latter it follows to long. 135° e., where it trends in a s.s.w. direction, ascending the Usuri tributary for 200 m., and then runs straight to the sea at the northern frontier of Corea. In the official language of Russia, however, Siberia is not of so wide extent. The Russian possessions in Turkestan form a separate division under the name of **CENTRAL ASIA**, and to this portion of the empire the governments of Akmollinsk, Semipalatinsk, Turgai, and Uralsk are now attached. Geographically speaking, these governments belong to Siberia; as do also considerable areas e. of the Ural mountains, which for administrative purposes, form part of the European governments of Perm and Orenburg. The following article deals mainly with the region officially termed Siberia; for the Russian possessions in the Turkestan territory, see **ASIA, CENTRAL**. The following are the subdivisions or governments of Siberia:

Divisions and Provinces.	Surface in Eng. Sq. Miles.	(Pop. 1870.)
1. The Eastern Seaboard.....	708,253	43,320
2. Amur-land.....	107,514	22,297
3. Yakutsk.....	1,500,141	231,977
4. Transbaikalia.....	210,799	430,780
5. Irkutsk.....	279,963	378,244
6. Yeneseisk.....	958,042	372,862
7. Tomsk.....	329,783	838,756
8. Tobolsk.....	565,920	1,086,848
Total	4,660,415	3,405,084

(With central Asia, but excluding the Caucasus, the total area of Russian Asia is nearly 6,000,000 sq. m., and the pop. 4,500,000.) It thus appears that in Siberia proper there are about three inhabitants to every four English sq. miles. The northern and eastern shores are very irregular in form, jutting out frequently into bold peninsulas and promontories and being indented with numerous immense inlets, chief of which are the estuaries of the Obi (575 m. in length) and of the Yenesei; the gulf of Anadir, and the sea of Okhotsk. All the island groups to the n. of Siberia, and since 1875 the whole of Sakhalin or Saghalien on the e. coast, belong to Siberia; whereas, since 1875, all the Kurile islands are Japanese. The Liakhoff group, near the mouth of the Lena, consists of three islands from 60 to 100 m. long by 20 to 40 broad, and of numberless islets; they are completely barren, and present in their soil and subsoil alternate layers of sand and ice, in which are imbedded the fossil remains of numerous animals. The greatest length of Siberia is 5,600 m. from n.e. to s.w., and the greatest breadth 2,170 m. from n. to south. A country of such vast extent (greatly larger than Europe) must necessarily exhibit great varieties of climate; and we accordingly find in the northern regions, much of which lie far within the Arctic circle (cape Sievero Vostochnii, the most northerly promontory of Siberia, and of the old world, being in lat. 78° 25' n.), an extensive tract bordering on the ocean, composed of swamp, moorland, and mossy flats, covered with snow and ice for one-half of the year, and even during the greatest heats of summer, released from its icy bonds only to the depth of a few inches below the surface of the soil. The ocean, its northern boundary, is frozen for miles seaward during more than half the year, and during the remaining months, the numberless icebergs and floes which crowd the sea, and continually come into collision, render the navigation so dangerous that no complete hydrographic survey of the coast has yet been made. On the southern boundary of this semi-barren zone, stunted misshapen bushes and trees are found; and as we advance southward, vegetation appears in the form of extensive forests of birch, fir, and larch, which clothe the plains and hill-sides, and are interspersed with stretches of pasture of moderate quality. After crossing the parallel of lat. 64° n. in west Siberia, and that of lat. 61° n. in east Siberia, the more hardy cereals, barley, oats, and rye, begin to appear, and the soil increases in fertility, sometimes to an extraordinary extent, thick woods of Siberia cedar and other trees clothe the mountain sides, and the valleys, especially along the banks of rivers, are in a state of continuous cultivation. The whole of western Siberia is one great plain, sloping from its southern boundary, where the average elevation is 2,000 ft., northward to the Arctic ocean; with the exception of the small corner in the s.w., which is drained into the Caspian and Aral seas. The fertility of a great portion of the governments of Tobolsk and Tomsk, especially of the *Baraba* and *Ischim* steppes, is proverbial, and they are the great granaries of Russia and northern Europe. But the warmest and perhaps most fertile part of western Siberia is the valley of the Yenesei, n. of the Sayansk mountains. Eastern Siberia is more hilly and less fertile than the western portion, but the valleys and hill-sides afford good pasture. Four-fifths of Siberia is drained by the three immense rivers Obi (q.v.), Yenesei (q.v.), and Lena (q.v.), and by a number of smaller rivers, all of which flow to the Arctic ocean. Siberia has a large number of lakes, some of which are little else than

salt marshes; the largest of them are lake Baikal (q.v.) and lake Balkash (q.v.). The chief mountain range of Siberia is the Altai chain, which forms the southern boundary toward Mongolia, and ramifies eastward and northward from the region of lake Baikal, covering a large portion of the surface of eastern Siberia. The Stanovoi hills stretch from the Amur n.e. along the shores of the sea of Okhotsk. The Yablonnoi mountains, which long found a place in books of geography, were shown by the Russian exploring commission (1863) to have no existence, the place where they were supposed to be situated being an undulating plateau, which connects the basin of the Indigirka and the sea of Okhotsk. Lofty mountain-chains traverse the island of Saghalien and the peninsula of Kamchatka, in which there are 21 active volcanoes, the loftiest of which is Kliutshewsker; elevation 15,000 feet. Among the wild animals of Siberia are the reindeer in the northern flats, and on the high mountains of the s.; the arctic or black fox, and white bear in the n.; the sable, ermine, marmot, marten, squirrel, Caspian antelope, and wild sheep—all in the s.; and the lynx, wolf, wild-boar, and glutton are generally diffused. Camels are found among the Kirghiz, along with the broad-tailed sheep, the Russian sheep being also domesticated in Siberia; and horses of good quality, an inferior sort of cattle of the Russian breed, and a large wolfish-looking dog, used chiefly to draw sledges, complete the list of domestic animals. Fresh and salt water fish abound, and feathered game is plentiful in the south. The mineral wealth of Siberia is great: gold, silver, copper, and lead are found in all the mountainous districts on the w. and s.; platinum, iron, and precious stones, including diamonds, are found on the eastern slopes of the Ural; zinc, antimony, arsenic, plumbago, and valuable emerald and topaz mines are worked in the districts n. of the Amur; and porphyry, malachite, jasper, and salt (from the steppes) are common. More than half of the inhabitants of the central and western provinces are Russians and Poles, or of Russian and Polish descent, and these have been sent to the country either as exiles, on account of political or criminal offenses, or as government colonies. The most abandoned class of exiles are kept to hard labor in the mines; others are put to less laborious, but still compulsory work; and a third portion are settled in specified districts, under surveillance of the police, and allowed to employ themselves as they choose. This last class chiefly employs itself in trapping those animals whose skins and furs form valuable articles of trade. In the north-west are found the Samoieds, and adjoining them the Ostiaks, both of whom live by hunting and fishing alone. In the s. are the nomad tribes of the Kirghiz (q.v.) and Kalmucks (q.v.), both cattle-breeding peoples, though the latter have now partially adopted a settled mode of life, and manufacture iron and gunpowder. Next to them, on the borders of Mantchooria, are the Buriats, a people of Mongol origin, and the most numerous tribe in Siberia; to the n. of whom are the Yakuts and Tunguses, of Tartar origin, who are spread over the whole of eastern Siberia, from the town of Irkutsk to the Stanovoi range, and live mostly by hunting. The Tchukchis, an Esquimaux race, and the Koriaks inhabit the n.e. corner, and the Manchus are the population of the Amoor territory. Manufactures are unimportant, and are confined to the principal towns; the barter trade in European goods is carried on at Obdorsk, Ostrovnoe, Yakutsk, and Petropavlovsk; and the transit-trade with China through Kiahta (q.v.), the imports from China being tea of the finest quality, sugar, silk, cotton, wool, grain, fruits, etc.; and the exports to that country, cotton and woolen cloths, linen, furs and skins, leather, and articles of gold and silver. The exports to Russia are the natural produce of the country, and are transported westward to the frontier by alternate land and river carriage, to Tobolsk, thence over the Ural mountains to Perm. Reindeer sledges are the usual means of transport in winter. Fairs are held at stated periods in certain localities, and much of the trade of the country is there transacted. The chief towns in Siberia proper are Tobolsk, pop. 20,000; Tjumen, 13,000; Tomsk, 24,000; Irkutsk, 27,000. Siberia seems to have been first made known to the Russians by a merchant named Anika Stroganoff; and soon after, the conquest of western Siberia was effected by the Cossack Vassili Yermak, an absconded criminal, at the head of a numerous band of wild followers. After Yermak's death in 1584, the Russians pursued their conquests eastward, founding Tomsk in 1604, and though they often experienced serious reverses, their progress was rapid, the sea of Okhotsk being reached in 1639, and Irkutsk founded in 1661. Frequent disturbances have occurred between the Russians and the Chinese and Tartars, which have resulted in the extension southward of the Siberian boundary into Mantchooria and Turkestan (q.v.). In 1845 the left bank of the Amoor became Russian. In 1858 the frontier was extended along the sea-board s. of the river to the frontier of Corea. The Russians have now a large number of steam-vessels on the Amoor. Recent voyages of exploration point to the practicability of opening direct and extensive commerce between Archangel and the rivers Obi and Yenesei. The Lena is also navigable for a great distance from its mouth.—See Atkinson's *Oriental and Western Siberia* (Lond. 1858); and various articles in the *Geographical Magazine* for 1876, etc.

SIBLEY, a co. in central Minnesota, bordered on the e. by Minnesota river; 525 sq. m.; pop. '80, 10,637. The surface is undulating, and is partly covered with forests. It contains lake Minnetonka, 30 m. in length, and other lakes of smaller size. The soil is fertile, and the main productions are wheat, Indian corn, oats, hay, and wool. Co. seat, Henderson.

SIBLEY, HENRY H., b. Detroit, Mich., 1811; son of judge Solomon Sibley, lived for many years at Mackinaw and fort Snelling, employed by the American Fur co. He was delegate from the territory of Minnesota, 1849-53; first governor of the state, 1858; during the late war brig. gen. of vols. He took charge of an expedition against the Indians on the Minnesota frontier, 1863; brevetted maj. gen. of volunteers.

SIBLEY, HIRAM, b. Mass. 1807; in early life he was a manufacturer of machinery, but became interested in telegraph corporations, and by his exertions about twenty weak companies were united in one, the Western Union, thus establishing the business on a strong foundation. He was prominent in securing the building of the Pacific telegraph line, and was intending to carry a line to Europe by way of Behring strait had the Atlantic cable failed. Mr. Sibley has contributed \$100,000 each to the universities of Cornell and Rochester.

SIBLEY, JOHN LANGDON, b. Me. 1804; educated at Harvard college, of which he was librarian, 1825-26, 1841-56, and 1856-77. He has written a history of *Union, Maine; Notices of the Triennial Catalogues of Harvard University, and Harvard Graduates*. His rank among librarians is high.

SIBYL (Gr. *sibylla*, according to the old derivation from *dios boule*; Doric, *sios bolla*—the “will or counsel of God”), the name anciently given to several prophetic women, whose history, in so far as they have any, has come down to us in a wholly mythical form, if, indeed, such beings ever existed at all! Their number is differently given; some writers (Ælian, for example) mention only four—the Erythrean, the Samian, the Egyptian, and the Sardinian; but in general ten are reckoned, viz., the Babylonian, the Libyan, the Delphian, the Cimmerian, the Erythrean, the Samian, the Cumæan, the Trojan or Hellespontian, the Phrygian, and the Tiburtine. Of these, by far the most celebrated is the Cumæan, identified by Aristotle with the Erythrean, and personally known by the names of Herophile, Demo, Phemonoe, Deiphobe, Demophile, and Amalthæa. She figures prominently in the 6th book of Virgil’s *Æneid*, as the conductor of the poet into the realm of the shades. The Roman legend concerning her (as recorded by Livy) is, that she came from the east, and appearing before king Tarquin the proud, offered him nine books for sale. The price demanded appeared to the monarch exorbitant, and he refused to purchase them. She then went away, destroyed three, and returning, asked as much for the remaining six as for the nine. This was again refused, whereupon she destroyed other three, and once more offered to sell him the rest, but without any abatement of the original price. Tarquin was struck by her pertinacity, and bought the books, which were found to contain advices regarding the religion and policy of the Romans. They were preserved in a subterranean chamber of the temple of Jupiter on the Capitoline, and were originally intrusted to two officials (*duumviri sacrorum*), appointed by the senate, who alone had the right to inspect them. The number of keepers was afterward increased to 10 (*decemviri*), and finally, by Sulla, to 15 (*quindecimviri*). In the year 84 B.C., the temple of Jupiter having been consumed by fire, the original sibylline books or leaves were destroyed, whereupon a special embassy was dispatched by the senate to all the cities of Greece, Italy, and Asia Minor, to collect such as were current in these regions. This being done, the new collection was deposited in the temple of Jupiter after it had been rebuilt. Spurious sibylline prophecies—or what were regarded as such—accumulated greatly in private hands toward the close of the republic; and Augustus, fearing, perhaps, that they might be turned to political uses, ordered them all to be given up to the city-prætor, and burned them. More than 2,000 were destroyed on this occasion. The remainder were kept in the temple of Apollo, on the Palatine, under lock and key; but the whole perished during the burning of Rome in the time of Nero. Other collections were made; and as late as the 6th c., when the city was besieged by the Goths, there were not wanting some who pretended to predict the issue from a consultation of these venerable oracles. It is, however, beyond doubt, that as early, at least, as the 2d c. A.D., when enthusiastic men sprang up in the Christian church, prophesying in a poetic-oracular style (whence they were sometimes called *sibyllists*), the sibylline books were much interpolated and falsified to assist the progress of the new faith. The utterances of these Christian sibyllists form a special department of early ecclesiastical literature, and are a mixture of Jewish, pagan, and Christian ingredients. The collections of them also bear the name of “sibylline books.” An edition was published by Galleus, at Amsterdam, in 1689, and was entitled *Oracula Sibyllina*; fragments have also been edited by Angelo Mai (Milan, 1817) and Struve (Königsberg, 1818).—Consult Bleek, *Ueber die Entstehung und Zusammensetzung der uns in acht Büchern erhaltenen Sammlung Sibyllinischer Orakel* (in Schleiermacher’s *Theologische Zeitschrift*, Berl. 1819) and Thorlacius, *Libri Sibyllistarum Veteris Ecclesiæ* (1822); Ewald, *Ueber Entstehung, Inhalt und Werth der Sibyllinischer Bücher* (Gött. 1858).

SICILIAN VES PERS, the name given to the massacre of the French in Sicily, on the day after Easter (March 30), 1283, the signal for the commencement of which was to be the first stroke of the vesper-bell. In the articles NAPLES, KONRADIN, MANFRED, etc., it is related how Charles of Anjou, the brother of Louis IX. of France, had deprived the Hohestaufen dynasty of Naples and Sicily, and parceled out these kingdoms into domains for his French followers; but his cruelty toward the adherents of the dispossessed race, his tyranny, oppressive taxation, and the brutality of his followers, excited

among the vindictive Sicilians the deadliest animosity. The aged Giovanni da Procida, a steady partisan of the Hohenstaufen family, took the lead in directing and systematizing a conspiracy against Charles and his followers; and after a visit to Pedro of Aragon (the husband of Constance the cousin of Konradin, and the next heir to Naples and Sicily), whom he found willing to undertake the conquest of Sicily, he returned to his self-imposed duty in the island. On the evening of Easter-Monday the inhabitants of Palermo, enraged (according to the common story) at a gross outrage which was perpetrated by a French soldier on a young Sicilian bride, precipitated the accomplishment of the scheme by suddenly rising upon their oppressors, putting to the sword every man, woman, and child of them, not sparing even those Italians and Sicilians who had married Frenchmen. This example was followed, after a brief interval, by Messina and the other towns, and the massacre soon became general over the island: the French were hunted like wild beasts, and dragged even from the churches, where they vainly thought themselves secure. More than 8,000 of them were slain by the Palermitans alone. Only one instance of mercy shown to a Frenchman is on record, the fortunate subject being a Provençal gentleman, Guillaume des Porcellets, who was much esteemed for his probity and virtue. The governor of Messina also succeeded in passing the strait with his garrison before it was too late.—See Amari, *La Guerra del Vespro Siciliano* (Palermo, 1841; 6th ed. Flor. 1859), and Possien and Chantrel's *Les Vêpres Siciliennes* (Paris, 1843).

SICILIA NA, in music, a name given to a slow, soothing, pastoral description of air, in $\frac{6}{8}$ time; so called because the dance peculiar to the peasantry of Sicily possesses this character.

SICILY, the largest, most fertile, and most populous island in the Mediterranean sea, lies between lat. $36^{\circ} 38'$ and $38^{\circ} 18'$ n., and between long. $12^{\circ} 25'$ and $15^{\circ} 40'$ e., and is separated from the main-land of Italy by the strait of Messina. Its shape roughly resembles a triangle (whence the early Greek navigators gave it the name of *Trinaeria*, the "Three-cornered")—the eastern coast, from Capo del Faro in the n. to Capo Passaro in the s., forming the base; and the northern and south-western coasts the sides, which gradually approach each other toward the n.w. The length of the base is 145 m.; of the northern side 215 m.; and of the south-western 190 m.; the circumference of the island, including the sinuities of the coast, is estimated at 624 miles. Area about 10,000 sq. miles. Pop., according to the census of Dec. 31, 1871, 2,584,099. Capo Passaro, at the south-eastern extremity, is only 56 m. from Malta; and Capo Boco, near Marsala, at the north-western, only 80 m. from cape Bon on the African coast.

Physical Geography.—The island of Sicily, like the main-land of Italy, is traversed throughout its entire length by a chain of mountains, which may be looked upon as a continuation of the Apennines (q.v.). This chain, beginning at Capo del Faro on the strait of Messina, runs in a south-south-western direction as far as Taormina, where it turns off to the w., and stretches across the whole island, keeping, however, much nearer to the northern than to the south-western coast. The first part of the chain, from Capo del Faro to Taormina, is called the Peloric range (anc. *Neptunius Mons*), which in Monte Dinmare attains the height of 3,260 ft.; the second and much the longer part is called the Madonian range (anc. *Nibrodus Montes*), which, in the Pizzo di Palermo, rises to an elevation of 6,328 feet. It forms the great watershed of the island. Toward the north-western coast the chain breaks up into irregular and often detached masses, such as Monte Pellegrino (1963 ft.) and Monte San Giuliano (2,184 ft.). About the center of the chain a range branches off through the heart of the island to the s.e.; at first wild and rugged, but afterward smoothing down into table-lands, which in turn slope away tamely to the sea. There are innumerable other spurs to the s. from the great Madonian chain, of inferior length and elevation, but none of these require special mention. The volcano of Etna, which rises in solitary grandeur on the eastern coast, is separately described. See ETNA. Sicily is not, on the whole, a well-wooded country, but forests of considerable size are found here and there as, for example, the royal forests near Caronia and Mezzojuso, the forest-zone of Etna, etc. In the interior of the island there is not much level land, but on several parts of the coast there are extensive plains, generally of great fertility. The principal of these are the great plain of Catania (anc. *Campi Leontini*), out of which rises Etna; the plains of Palermo, termed the *Conca d'Oro*, or "Golden Shell," of Castellamare, of Lianta, and Terranova.—Although rivers are numerous, none are navigable. The largest are the Simeto or Giarretta, the Cantara, the Salso, the Platani, and the Belici.

Climate.—The climate of Sicily is very warm, but salubrious, except in low-lying places where there is a mephitic atmosphere. The best health is enjoyed in the lower regions of Etna, which is very densely peopled, although exposed to eruptions and violent earthquakes. The heat is intense in summer when the sirocco blows. After the autumnal equinox violent winds are prevalent, torrents of rain fall, and all along the coasts the atmosphere is charged with moisture and fogs. The earthquakes begin about the end of winter, and do great damage. Snow and ice are rarely to be seen except on Etna.

Geology and Mineralogy.—The primary rocks in the mountainous districts are chiefly quartz, granite, and mica. In some parts these are overlaid by limestone rocks. Most

of the lower rangés of hills are of calcareous formation, and are rich in metallic ores. Sulphur forms the chief mineral wealth of Sicily. Immense beds of it are found in the central and northern parts of the island. The English export about 42,000 tons of it per annum, and the mines are worked by Cornish miners and their descendants.

Soil, Agriculture, etc.—The soil of the island is so fertile that very little labor is required to raise the crops. In many valleys there is rich soil to the depth even of 40 feet. In Catania decomposed lava is spread over the ground, greatly increasing its fertility. The crops of grain are large, and might be prodigious if agriculture were better understood. The harvests are such that they recall to mind the words of Livy, in speaking of Sicily, "*Populoque Romano, pace ac bello, fidelissimum annonæ subsidium*" (lib. xxvii. 5). In the most ancient times agriculture was sedulously prosecuted, but it began to decline when the island was deprived of its independence by the Carthaginians. In more recent times the restrictions on the exportation of grain served not only to keep agriculture from making any progress, but also to put a drag upon the commerce of the country; which, on every attempt made to raise itself, was met by fresh obstacles in the shape of new taxes. The Italian government has greatly alleviated the obstacles to agriculture, and the salutary effects of the change of system are already apparent. The soil produces corn, maize, flax, hemp; excellent cotton near Mazzara, and in Catania; sugar, equal to that of the East Indies, along the southern coast; grapes (350,000 acres), olives (125,000 acres, with an annual yield in oil of 15,000 tons), saffron, oranges, lemons, citrons, pomegranates, figs, pistachios, dates, castor-oil, mulberry, sumach, tobacco, and manna. The vine has been cultivated with the greatest care at Marsala since 1789, when an English firm, settled there, began to export it. Now, upward of 5,000,000 gallons are annually exported to England, America, and India.—Sicily possesses the best tunny-fisheries in the Mediterranean. The fisheries for coral at different places on the coast are also industriously carried on, and on an average about 2,100 pounds are annually obtained.

Manufactures, Commerce, etc.—The manufactures of Sicily are insignificant, and are nearly altogether confined to silk, cotton, and leather.—The most important articles of export are sulphur, sumach, fruits, and wine; of import—cottons, woolens, silks, linens, earthenware, hardware. Great Britain, France, and the United States are the countries with which the Sicilians chiefly carry on commerce. The statistics of exports and imports are untrustworthy, but the latter considerably exceed the former. More than 200 miles of railways have recently been constructed.

Religion, Education, etc.—With the exception of about 58,000 Greeks, and a few thousand Jews, the inhabitants are all Roman Catholics; but though equally ignorant, they are not so superstitious as the Neapolitans; at least their superstition has not destroyed their love of political freedom, as has repeatedly been evinced in their history—most recently in the ardor with which they responded to the summons of Garibaldi to liberate themselves from the tyranny of the Bourbons. There are three universities—at Palermo, Catania, and Messina; and also a collegio de' Nobili at Palermo.

Political Divisions.—Sicily is divided into 7 provinces or prefectures—viz., Palermo, Mes-sina, Catania, Noto or Siracusa, Caltanissetta, Girgenti, and Trapani. Each province is subdivided into 3 or 4 districts, and these again into numerous *communi*, or "townships." Over the province is placed an *intendente*, or, as he is now called, a "prefect;" over the district a sub-prefect; and over the commune a *sindaco* ("syndic," or "mayor"). The prefect presides over every department of the provincial administration, and also over the provincial council—a body composed of from 15 to 20 land-holders, who meet once a year, and sit for 20 days, examining the accounts of the province, and framing the provincial budget. The two subordinate divisions have also their "councils;" and the members of all three are appointed either by the king, or by the prefect. Of course this insular self-government does not supersede the necessity of sending Sicilian deputies to the national parliament at Rome.

History.—Sicily, was inhabited, in prehistoric times, by a people who bore the name of *Siculi* or *Sicani*, and who, according to a universally received tradition—crossed over into the island from the southern extremity of the mainland. Their names and every fact that we can ascertain about them, lead to the supposition that they were members of the great Latino-Italian family that, entering Italy from the n., gradually pushed its way across the Apennines to the peninsula of Bruttium (see article *ROME*). Beyond this rational conjecture, however, we cannot proceed, and the actual history of Sicily only begins to emerge out of utter darkness with the establishment of Greek and Phœnician colonies. The earliest Greek colony, that of Naxos, was founded 735 B.C.; the latest, that of Agrigentum, 580 B.C. During the intervening century and a half, numerous important colonies were established (either directly from Greece or as offshoots from the older Greek settlements in the island); Syracuse (734 B.C.), Leontini and Catania (730 B.C.), Megara Hyblæa (728 B.C.), Gela (690 B.C.), Zancle, later Messina (date of origin uncertain), Acæra (664 B.C.), Himera (648 B.C.), Mylæ (date of origin uncertain), Casmenæ (644 B.C.), Selinus (628 B.C.), Camarina (599 B.C.), Agrigentum (580 B.C.). The earlier history of these cities is almost unknown. What is recorded is vague and general. We read that they attained great commercial prosperity, that they subjugated or wrested from the Siculi, Elymi, and other "native" tribes, large portions of neighboring territory; and that their governments (like those of the republics in the mother-country) were

at first oligarchical, and latterly democracies or "tyrannies;" but it is not till the period of the "despots" that we have detailed accounts. Then the cities of Agrigentum and Gela acquire prominence—the former, under the rule of Phalaris (q.v.), becoming, for a short time, probably the most powerful state in Sicily; and the latter, under a succession of able tyrants, Cleander, Hippocrates, and Gelon (q.v.), forcing into subjection most of the other Greek cities. Gelon, however, transferred his government to Syracuse (one of his conquests), which now became the principal Greek city of Sicily—a dignity it ever after retained. Contemporary with Gelon, and possessed of the same high capacity for governing, were Theron, "tyrant" of Agrigentum, and Anaxilaus, tyrant of Rhegium, and conqueror of Zancle, to which he gave the name of Messina. Meanwhile, the Carthaginians—a people wholly different from the Greeks, in language, religion, origin, and civilization—had obtained possession of the Phenician settlements in Sicily. The first appearance of the Carthaginians in the island dates from 536 B.C.; but the steady growth of the Greek cities in wealth and power, long confined their rivals to the north-western part, where their principal colonies were Panormus, Motya, and Soloeis. The first open trial of strength took place in the great battle of Himera, where the Carthaginian army was utterly routed by Gelon, and its leader, Hamilecar, slain. The Gelonian dynasty at Syracuse fell 466 B.C., after experiencing various fortunes. During the next 50 years the island had peace. In 410 B.C., however, the war between the Carthaginians and Greeks for the possession of the island was renewed. The successes of the former were great and permanent. Selinus, Himera, Agrigentum, Gela, and Camarina, fell into their hands in less than five years; and it was not till Syracuse had got a new "tyrant," the famous Dionysius (q.v.) the elder, that fortune again began to smile on the Greeks. Even he, however, could not wrest from the Carthaginians what they had already won; and after the war of 383 B.C., a peace was concluded, which left Dionysius in possession of the eastern, and the Carthaginians of the western, half of the island. The dissensions and tumults that followed the decease of Dionysius, illustrate forcibly the peculiar dangers to which the Greek republics, either at home or abroad, were prone; but we can only afford to notice the triumph of the popular party under Timoleon (343 B.C.), and the splendid victory of the latter over the Carthaginian generals, Hasdrubal and Hamilecar, at the river Crimissus, 340 B.C. Once more Greek influence was in the ascendant, but the rule of the bold and ambitious tyrant Agathocles (317-289 B.C.) proved in the main disastrous to Greek supremacy. After his death Syracuse lost her hold over many of the Greek cities, which established a weak and perilous independence, that only rendered the preponderance of the Carthaginians more certain. Finally, Pyrrhus (q.v.), king of Epirus, was invited over to help his countrymen, and in 278 B.C. he landed in the island. The brilliant adventurer—one of the most romantic figures in classic history—for a time swept everything before him. Panormus, Ercte, and Eryx were captured; and though he failed to make himself master of Lilybæum, he might probably have forced the Carthaginians to surrender it, had he not been thwarted in his designs by the miserable discords and jealousies of the people whom he came to save. As it was, Pyrrhus left Sicily in about two years; and in all likelihood the island would have sunk into a Carthaginian possession, had not a new power appeared on the stage—viz., the Roman. The struggle for supremacy between Rome and Carthage—the most tremendous struggle in ancient history—is sketched in the article *ROME*, and in the biographies of the leading generals, and, therefore, need not be narrated here. Suffice it to say, that in 246 B.C., Carthaginian Sicily, and in 210 B.C., the whole island became a Roman "province"—the first Rome ever held. Henceforth it shared the fortunes of the great state to which it was annexed, and its special history need only be rapidly glanced at. In 135-132 B.C., and again in 103-100 B.C., it was the scene of two formidable slave-insurrections, during which it was frightfully devastated. Its fertility, and the wealth of its citizens and landholders, were also powerful temptations to greedy and unscrupulous governors, of whom we have a specimen in Verres (pretor 73-70 B.C.), "damned to everlasting fame" in the orations of Cicero. Augustus visited Sicily after the close of the civil wars, and established some colonies; but it does not seem to have prospered under the empire; and in 440 A.D. it was conquered by the Vandals under Genseric. The Vandals, in their turn, were compelled to cede it (480 A.D.) to Theodoric king of the Ostrogoths, in whose hands it remained till 535 A.D., when Belisarius conquered and annexed it to the Byzantine empire. In this condition it remained till 827, when the Saracens invaded the island, and after a protracted struggle, lasting for 114 years, expelled the Byzantine Greeks, and made themselves masters of Sicily. They kept possession of it for upward of a century, but after a contest of 30 years, were driven out by Robert Guiscard (q.v.) and Roger de Hauteville, at the head of a body of Normans, aided by the "native" inhabitants, whom we conjecture to have been much the same as they were in the old classic times—for the successive waves of barbaric and Saracenic invasion that swept over the island, appear to have left little trace of their action. Even to this day it is highly probable that the people of Sicily are largely the descendants of the early Siculi. The Normans held rule in the island from 1072 to 1194; and the Norman "kingdom of Sicily and Naples," or "kingdom of the two Sicilies," dates from 1120, when Roger II. obtaining possession of most of the continental dominions of his uncle, Robert Guiscard, assumed the title of king. During the rule of the Swabian dynasty (see *HOHENSTAUFEN*, *HOUSE OF*), 1194-1258, the political

history of Sicily is the same as that of Naples; but in 1282, after the dreadful massacre of the French, known as the Sicilian Vespers (q.v.), it again became independent, chose for its king Pedro III. of Aragon, who was the sole representative by marriage of the house of Hohenstaufen, and remained in the possession of the Aragonese sovereigns till 1505, when the union of the crowns of Castile and Aragon—in other words, the rise of the Spanish monarchy in the persons of Ferdinand and Isabella—placed it under the dominion of Spain. The fortune of war also gave Ferdinand the possession of Naples; and the Spanish kings retained both countries until the war of the Spanish succession, 1700–13 (see SUCCESSION WARS). By the treaty of Utrecht (1713), Sicily was separated from Naples, and handed over to Victor Amadeus, duke of Savoy, who, however, restored it to the crown of Naples by the treaty of Paris, seven years after, receiving in exchange the island of Sardinia. From 1720 the two countries continued under the same dynasty, the house of Austria, 1720–84; and the Spanish Bourbons, 1784–1860 (if we accept the brief rule of the French in Naples, 1806–15, when Joseph Bonaparte, and afterward Joachim Murat, were kings), down to the period of Garibaldi's invasion (see ITALY, and GARIBALDI), which resulted in the annexation of both to the new kingdom of Italy under Victor Emmanuel.

SICKINGEN, FRANZ VON, 1481–1523; b. in the duchy of Baden; became a distinguished soldier, and ably supported the cause of the emperors Maximilian and Charles V. He was noted as the champion of the oppressed, resisting the despotism of princes and the arrogance of the clergy; supported Lutheranism in the Rhenish provinces, and as the patron of learning protected Reuchlin, Ecolampadius, and Ulrich von Hutten. Involved in a feud with Hesse and the Palatinate, he was mortally wounded while defending his castle.

SICKLES, DANIEL EPHRAIM, b. N. Y., 1822; educated at the university of New York; studied law and began to practice in 1844. He soon became a politician, served in several offices, was secretary to the English legation in 1853, and was member of congress, 1856–62. In 1859 he shot and killed Philip B. Key for alleged intimacy with his wife, and was tried for murder, but acquitted. In 1861 he raised and became col. of the Excelsior (New York) brigade. He commanded a brigade under Hooker, and at Antietam and Fredericksburg was at the head of Hooker's old division. At Chancellorsville and Gettysburg he commanded the 3d corps. In 1869 he became minister to Spain, resigning in 1874.

SICULIANA, a city of Sicily, province of Girgenti, and 8 m. w.n.w. of the city of that name. It stands on the sea, and has a small, badly situated harbor. Pop. 5,764.

SICYON, the principal city of a very small but exceedingly fertile state of ancient Greece, Sicyonia, situated in the n. of the Peloponnesus, having the Corinthian gulf for its northern boundary, with Achaia on the w., Phlius on the s., and Corinth on the east. The territory was level toward the sea, somewhat mountainous in the interior, and well watered by the two rivers Asopus and Helisson, between which on a triangular plateau was situated Sicyon, about 2 m. s. of the Corinthian gulf, and 10 n.w. of Corinth. Round the three sides of the plateau ran a wall, which combined with the precipitous nature of the heights that surrounded it rendered the position of Sicyon one of great strength. It is supposed that at one time it had, like Athens, a double wall reaching from the city to the port on the sea of Corinth. Sicyon was anciently celebrated as a chief seat of painting and statuary (tradition asserting that the former was invented there), it having given its name to a school of painting which included among its disciples Pamphilus and Apelles, both natives of Sicyon. It was also the native city of Aratus (q.v.), the gen. of the Achaean league. There exist at the present day a few remains of the ancient city, as well as of the more modern buildings erected by the Roman conquerors of Greece, near which stands a small modern village named *Vasilika*.

SIDA, a genus of plants of the natural order *malvaceae*, containing a large number of species, annual and perennial herbaceous plants and shrubs, mostly natives of warm climates and widely diffused. They generally abound in mucilage, and some of them are used in medicine in India, as the mallow and marsh-mallow are in Europe. They have also strong pliable fibers, which are employed for cordage and for textile purposes. —*S. tiliifolia*, an annual, has long been cultivated in China, where it is called *king-ma*, for the sake of its fiber, which is used like that of hemp. It is too tender for the climate of Britain, but its cultivation has been introduced into Italy and France.

SIDDONS, MRS. SARAH, was the daughter of Mr. Roger Kemble, a provincial actor, and was born at Brecon, in South Wales, on July 5, 1755. As a mere child she was brought on the stage on the occasion of a benefit of her father's, and from that time up to her 15th year she continued to act as a regular member of his company. An attachment having sprung up between her and a young Mr. Siddons, an actor, with the somewhat reluctant consent of her parents, she was married to him at Trinity church, Coventry, on Nov. 26, 1773, and in company with her husband went to act at the Cheltenham theater. Here she speedily drew great attention; and Garrick, hearing her praises in London, sent to Cheltenham a trusty emissary to report upon her. The result was an engagement offered her at the London Drury Lane theater, where, Dec. 29, 1775, she made her first appearance, acting Portia in *The Merchant of Venice* to the

Shylock of Mr. Garrick. Her beauty and fine person pleased the audience, but as an actress she made no great impression, and at the close of the season she failed to secure a re-engagement. It was considered that this was to some extent due to her having vexed the irritable vanity of Garrick by an unintentional error in stage business, which made him act with his back to the public in one of his pet passages, a mortification which the great man was little enough to remember and resent.

Leaving London thus in failure in 1776, in 1782 she returned to it to run a career of triumph as indisputably the greatest actress of her time. The intervening years she had passed in the exercise of her art on the stages successively of Birmingham, Manchester, York, and Bath, till the growth of her provincial reputation determined her recall to the metropolis. In 1784 her popularity was temporarily obscured by a calumny industriously circulated, which charged her with ungenerous and illiberal conduct toward certain of her fellow-performers; but with this trivial exception, till on June 29, 1812, in her great character of Lady Macbeth, she took her leave of the public, her course was one long series of successes. Subsequently she occasionally consented to reappear on the stage for charitable ends, or to promote a stage "benefit" in which she had a kindly interest. Her death took place in London on June 8, 1831.

As a tragic actress Mrs. Siddons has probably never been equaled in Great Britain; as a woman she was of unblemished reputation, and enjoyed the respect of all who knew her. She was the ornament of every society into which she went, and such was the estimation in which she was held, that she had access at will to almost any. Her genius is said to have been strictly a *stage* genius; elsewhere she seems to have been a woman of no extraordinary parts. But she had a certain way of making her mediocrities imposing. She carried her tragedy manners with her to the drawing-room or the dinner-table: Scott has recorded the amusement with which at Abbotsford he heard her stately blank verse to the domestic:

"I asked for water, boy! you've brought me beer;"

and Sidney Smith used to say it was never without a certain awe that he saw her "*stab the potatoes.*"

SIDE-BONES are enlargements situated above a horse's heels, resulting from the conversion into bone of the elastic lateral cartilages. They occur mostly in heavy draught horses with upright pasterns, causing much stiffness, but, unless when of rapid growth, little lameness. They are treated at first by cold applied continually, until heat and tenderness are removed, when blistering or firing must be resorted to.

SIDEREAL CLOCK, a clock so regulated as to indicate *sidereal time*. See DAY. The sidereal clock is a most important aid to the practical astronomer, and is one of the indispensable instruments of an observatory.

SIDEROGRAPHY (Gr. *sideros*, iron). The name applied by the inventor, Mr. Dyer, to a process of printing with compound iron (or rather steel plates, for they are case-hardened after engraving) plates, instead of plain plates of copper or steel. It is the plan now usually employed in printing bank-notes in which more than one color is given. The colored parts of the design are cut out of the main plates, and movable pieces are exactly fitted in, so that they can be retracted or pushed forward at will. They are withdrawn while the main plate is receiving its ink, and they are pushed forward beyond while receiving their supply of ink. This being done they are brought to one plane, and form a complete plate for printing from.

SIDEROXYLON, a genus of trees of the natural order *sapotacea*, having evergreen leaves and axillary clusters of flowers, natives of warm climates, and very widely distributed. They are remarkable for the hardness of their wood, which is sometimes called iron-wood, and is at least in some species so heavy as to sink in water. The wood of *S. inermis*, called *melkhout* at the cape of Good Hope, is there much used for making boats, bridges, agricultural implements, etc.

SIDI-BEL-AB BÈS, a t. of Algeria, in the province of Oran, and 50 m. s. of the town of that name. It is fortified, and contains barracks, telegraph and post offices. Markets take place here every week. The soil in the vicinity is fertile; grain, tobacco, and fruit are the chief products. Pop. of commune, 6,458.

SID'I MOHAMMED, 1803-73; b. Morocco; son of Abderrahman, whom he succeeded in 1859 as emperor of Morocco. He was soon involved in a war with Spain, caused by the robberies of the Rif pirates, was defeated by the Spanish under Prini and O'Donnell, and obliged to pay Spain an indemnity of 20,000,000 piasters. His introduction of reforms and the commercial concessions which he granted to foreigners caused several insurrections, in quelling one of which he lost his life.

SID LAW HILLS. See FORFARSHIRE and BIRNAM.

SIDMOUTH, a market t. and watering place on the s. coast of Devonshire, at the mouth of the little river Sid. Sidmouth was a borough and market-town, governed by a port-reeve, as early as the 13th century. It was anciently a place of some importance as a fishing-town and seaport, but the fishery has declined, and the harbor is in great measure filled up with sand and shingle, so that it is now accessible to small boats only. The town has for many years past been a favorite watering-place, remarkable for the

mildness and salubrity of its climate. The hills on each side of the valley of the Sid rise to a considerable height, and, where they terminate on the sea coast, form bold and lofty cliffs, e. and w. of the town, known respectively as Salcombe hill and High peak, about 500 ft. above the sea. Owing to the narrowness of the valley, the town presents no large frontage toward the sea; but the esplanade, protected by a sea wall 1700 ft. in length, built in 1838 to stop the encroachment of the sea, forms an excellent promenade. Villas and detached houses extend for some distance inland up the valley of the Sid on both sides of the stream. The town is neatly though irregularly built, lighted with gas, and paved, and contains baths, public rooms, etc. Pop. 71, 3,360. Some Roman remains have been found here. Sidmouth gives the title of viscount to the Addington family.

SIDNEY, ALGERNON, grand-nephew of the famous sir Philip Sidney, was b. in the year 1622. He received a careful education, and accompanied his father, the earl of Leicester, to Denmark and France, whither the latter had been sent on embassies. In 1641 he served with some distinction against the rebels in Ireland, of which country his father was then lord-lieut. for the king. Subsequently, in 1643, along with his elder brother, the viscount Lisle, he crossed to England, ostensibly to take service under the king, then at war with his parliament. The two brothers, however, on their arrival, joined the parliamentary forces. At the battle of Long Marston Moor, in which he was sharply wounded, Algernon's courage and capacity were conspicuous; and in evidence of the estimation in which he came to be held by his party, we find him, in 1646, lieutenant of the horse in Ireland, and governor of Dublin; and, subsequently, in 1647 after receiving the thanks of the house of commons for his services, appointed governor of Dover. The year before, he had been returned to parliament as member for Cardiff. In 1648 he was one of the judges at the king's trial, and though, for some reason not explained, he neither was present at the passing of sentence, nor signed the warrant of execution, his general approval of the proceedings is not doubted. He is reported to have afterward spoken of the execution as "the justest and bravest action that ever was done in England or anywhere else." In principle a severe republican, he resented the usurpation of power by Cromwell, and during the protectorate lived in retirement at the family seat of Penshurst, in Kent. In 1659, on the meeting of the restored parliament, Sidney was again in his place. He was nominated one of the council of state, and shortly after dispatched to Denmark on a political mission. After the restoration, he lived precariously on the continent, flitting about from place to place, but in 1677, a pardon was procured him from Charles II., and he returned to his native country. Nevertheless, he was still obdurately republican in his opinions, and it is undoubted that he schemed for the overthrow of the monarchy, and the establishment of a republic in its stead; for this end he solicited the aid of the French monarch, and there is evidence of his having been supplied with money by Barillon, the French ambassador. Obscurely his designs were suspected, and in June, 1683, when the Rye house plot was announced, the opportunity was seized to get rid of a man felt to be dangerous. Along with his friend lord Russell and others, he was arrested, and committed to the tower. On Nov. 21 he was tried for high treason before the brutal Jefferies, and on the merest mockery of evidence, found guilty, and condemned to die. On Dec. 7 he was beheaded on Tower hill. He met his death with heroic firmness, amid general sympathy and indignation. He has ever since enjoyed a sort of canonized reputation as a patriot hero and martyr, and it cannot be held undeserved, narrow and impracticable as we must admit his views to have been. In the history and theory of government, Sidney was more deeply learned than any man of his time. His *Discourses concerning Government* were first published in 1698; in 1704 another edition was issued, a third appeared in 1751, and the fourth in 1772. Sidney's life has been written by S. W. Meadley (Lond. 1813). See also Blencower's *Sidney Papers* (Lond. 1813).

SIDNEY, Sir PHILIP, the son of sir Henry Sidney, and Mary, sister to Robert Dudley, the favorite of queen Elizabeth, was b. at Penshurst, in Kent, on Nov. 29, 1554. When 10 years old, he was sent to school at Shrewsbury, whence, in 1569, he went to Christ church, Oxford. From Oxford he passed to Cambridge, which he left with a high reputation for scholarship and general ability. In 1572, as the custom then was for young men of rank, he went abroad on his travels. He was in Paris when the massacre of St. Bartholomew took place, and narrowly escaped being one of its victims. Thereafter, he visited Belgium, Germany, Hungary, and Italy; and in 1575 he returned home, perfected in all manly accomplishments. His uncle, Dudley, earl of Leicester, was at this time in the zenith of his fortunes, and for Sidney a court-career lay temptingly open. As a courtier, his success was great; and with queen Elizabeth he became, and continued while he lived, a special favorite. In 1576, as a mark of her approval, he was sent on an embassy to the court of Vienna, from which he returned in the course of the year following. Shortly after, he had the boldness to address to the queen a "remonstrance" against her proposed marriage with Henry duke of Anjou, a union to which she seemed herself not indisposed. It is significant of the high favor in which he was held by her, that Elizabeth, imperious as she was in temper, and little inclined to brook such interference, seems scarcely at all to have in this instance resented it. About this time, a quarrel with the earl of Oxford led to Sidney's

temporary retirement from court, during which, at Wilton, the seat of his brother-in-law, the earl of Pembroke, he wrote his celebrated *Arcadia*. In 1583 he consoled himself for the marriage of lady Penelope Devereux, to whom he had been ardently attached, and who figures as the Stella of his poems, by himself marrying Frances, the daughter of sir Francis Walsingham. By this lady he had one daughter, who survived him. In the spring of 1585 he is said to have meditated sailing with sir Francis Drake in an expedition against the Spaniards in the West Indies, but to have been expressly forbidden by Elizabeth, on a ground of anxiety "lest she should lose the jewel of her dominions." It does not seem nicely consistent with this pretty story, that later in the same year she appointed him governor of Flushing, whither he went to take part in the war then being waged between her allies, the Hollanders, and the Spanish. As it proved, she thus sent him to his death. At the battle of Zutphen, in Gelderland, after behaving with conspicuous gallantry, and having a horse killed under him, he received a musket-shot in the thigh, and after lingering for some days in great suffering, he died at Arnheim on Oct. 7, 1586, in the 33d year of his age. A beautiful trait of humanity is recorded of him as he was being borne wounded from the field. He complained grievously of thirst, and a bottle of water was procured for him, from which, as he was about to drink, he was touched by the wistful look up at it of a mortally wounded soldier, who lay close by, and taking it untasted from his lips, he handed it to his fellow in need, with the words: "Thy necessity is yet greater than mine." The estimation in which Sidney was held by his countrymen was shown in the passion of grief with which the news of his death was received. His body was brought to England, and after lying for some time in state, was buried with great solemnity in the old cathedral of St. Paul's, a general mourning on the occasion being observed throughout the country. The universities issued three volumes of elegies on his death, and Spenser, in his *Astrophel*, mourned for the loss of one who as a friend had been dear to him.

The love and admiration which Sidney won from his contemporaries was mainly a tribute to the singular beauty of his character. His short life was illustrated by no brilliant achievement; and his literary genius, though true and exquisite in its kind, would scarcely of itself have sufficed to account for the fervor of regard he inspired. But the purity and nobility of his nature, and the winning courtesies in which its gentle magnanimity expressed itself, took captive all hearts while he lived, and have since kept sweet his memory. "Simplinely mild, a spirit without spot," he lives in the history of his country as a rare and finished type of English character, in which the antique honor of chivalry is seen shading into the graces of the modern gentleman. His *Arcadia*, overrun as it is with the fantastic affectations of the time, may still be recognized by the reader who has patience to peruse it, as a work of indisputable genius, flushed with the lights of a fine imagination, and in its purity and tenderness of sentiment, giving an authentic reflex of the lovely moral nature of the writer. His other chief work, the *Defense of Poesie*, published in 1595, after all that has since been written in the way of philosophical exposition on this and cognate subjects, will even now be found to repay the attention of the reader. Many of his shorter poems, more especially some of his sonnets, are also of rare merit. See Fulke Greville's biography of Sidney, Zouch's memoirs of Sidney (1808), and H. R. Fox Bourne's *Memoirs of Sir Philip Sidney* (1862).

SIDNEY SUSSEX COLLEGE, Cambridge, was founded in 1598 by lady Frances Sidney, countess of Essex, or rather by her executors, in obedience to the instructions of her will. They obtained of queen Elizabeth a mortmain for the purpose, and purchased of Trinity college the site of the ancient convent of Franciscans, or Gray friars. There are 10 fellowships.

SIDON (Hebr. Zidon, perhaps "fishing-place"), anciently, a city of Phenicia, situated on the e. coast of the Mediterranean, in lat. 33° 34' 5" n., 45 m. s. of Berytus. It was built on a rising mound, protected by the sea on the n. and w.; while the bed of a river formed a natural fosse to the s., and the high hills shielded it to the e.; a double harbor gave shelter to its ships both in summer and winter. It soon rose, both by its exceptional position and the daring and enterprising character of its inhabitants, to the highest rank among the cities of Phenicia (q. v.), so that the whole country is sometimes designated by the name of Sidon, "the great," "the metropolis." The extensive commerce of Sidon is well known from ancient authorities. Its colonies extended over the coast of Asia Minor and the adjacent islands, the coast of Thrace and Eubœa, and even some parts of Sicily, Sardinia, Spain, the coast of Cornwall and the Baltic shores, the northern parts of Africa, and, in fact, nearly the whole of the ancient world. Their manufactures of glass and linen, purple dye and perfumes, were sources of unbounded wealth; and, whether they were the skillful workers, or merely the exporters and traders of those "divine" works in gold and silver, ivory and bronze, which were the marvel of both Greeks and Hebrews, so much seems certain, that they managed to be considered unanimously the most skillful workmen of their time. Although one of the cities assigned to the Israelites by Joshua, it never in reality belonged to them, but, on the contrary, was every now and then in arms against them, either singly, or in league with some of their deadliest enemies, and even subjugated them for a time. After being conquered itself by Tyre, the daughter-city, it attempted to throw off the

yoke at the invasion of Phœnicia by Shalmanezzer, to which king it surrendered. Under Assyrian, Chaldean, and Persian domination, it retained a kind of independence for its internal affairs, and under the Persians, actually reached its highest prosperity. But an unsuccessful revolt against that power, under Ochus, ended in its temporary ruin (351 B.C.). Speedily rebuilt and repeopled, it opened its gates to Alexander the great (333 B.C.), and from that time forth it fell successively into the hands of Syrian, Greek, and Roman rulers. Through the middle ages little is heard of it, except that it was taken by the Crusaders. During part of the 17th and 18th centuries, it again became an important place of commerce; but misrule and violence put an end to its rising prosperity, and the number of its inhabitants has sunk to about 5,000. There is still some little export of silk, cotton, and nut-galls. It is now called Saïda, occupies a place somewhat to the w. of the ancient city, and belongs to the Turkish pashalic of Acre. See PHENICIA.

SIEBENBÜRGEN (Seven Castles), the German name of the Austrian principality of Transylvania (q. v.).

SIEBENBURGE, a collection of conical heights in Rhenish Prussia, on the right bank of the Rhine, about 22 m. above Cologne. The highest of the peaks is the Löwenkopf or Löwenberg, 1560 ft. high; but the most famous is the Drachentels (q. v.).

SIEDL'EC, a government in w. Russian Poland, bounded on the n.e. and e by the Bug river; about 5,500 sq. m.; pop. '72, 543,392.

SIEGE (Fr. a seat, a sitting down) is the sitting of an army before a hostile town or fortress with the intention of capturing it. With certain elements, the success of a siege is beyond doubt; the result being merely a question of time. These elements are: first, the force of the besiegers shall be sufficient to overcome the besieged in actual combat, man to man. If this be not the case, the besieged, by a sortie, might destroy the opposing works, and drive away the besiegers. The second element is, that the place must be thoroughly invested; so that no provisions, reinforcements, or other aliment of war can enter. The third element is, that the besiegers be undisturbed from without. For this it is essential that there shall not be a hostile army in the neighborhood; or if there be, that the operations of the besiegers be protected by a covering army able to cope with the enemy's force in the field. The ancients executed gigantic works to produce these effects. To complete the investment, they built a high and strong wall around the whole fortress; and to render themselves secure from without, they built a similar wall facing outwards, beyond their own position. The first was circumvallation, the second contravallation. It was thus that Cæsar fortified himself while besieging Alexia, and maintained 60,000 men within his ring. In modern warfare, it is considered preferable to establish strong posts here and there round the place, and merely sentries and vedettes between.

Let us now assume that a fortress of great strength has to be reduced, and that the force of the enemy in the vicinity has been either subdued or held in check by a covering army. By rapid movements, the place is at once invested on all sides. This step constitutes merely a blockade; and if time be of little importance, is a sufficient operation, for hunger must sooner or later cause the fortress to surrender; but if more energetic measures are required, the actual siege must be prosecuted. Advantage is taken of any hidden ground to establish the park of artillery and the engineers' park; or if there be none, these parks have to be placed out of range. The besieging force is now encamped just beyond the reach of the guns of the fortress; and their object is to get over the intervening ground and into the works without being torn to pieces by the concentrated fire of the numerous pieces which the defenders can bring to bear on every part. With this view, the place is approached by a series of zigzag trenches so pointed that they cannot be enfiladed by any guns in the fortress. In order to accommodate the forces necessary to protect the workers, the trenches at certain intervals are cut laterally for a great length, partly encircling the place, and affording safe room for a large force with ample battering material. These are called *parallels*, and they are generally three in number. The distance of the first parallel will increase as small-arms become more deadly; but with the old smooth-bore muskets it was usual to break ground at 600 yards from the covered way of the fortress, while at Sevastopol ground was broken at 2,000 yards, and in the siege of Paris by the Germans the lines were begun at least 4 m. from the city. The locality of the parallel being decided on, a strong body of men is sent to the spot soon after nightfall. The attention of the garrison is distracted by false alarms in other directions. Half the men are armed cap-à-pie, and lie down before the proposed parallel; while the other half, bearing each pick and shovel, and two empty gabions, prepare for work. Each man deposits the gabions where the parapet of the trench should be. He then digs down behind them, filling the gabions with the earth dug out; and, after they are filled, throwing it over them, to widen and heighten the parapet. Before daylight the working-party is expected to have formed sufficient cover to conceal themselves and the troops protecting them. During the day, they—being concealed from the garrison—widen and complete their parallel, making it of dimensions sufficient to allow of wagons and bodies of troops with guns passing along. During the same night, other parties will have been at work at zigzags of approach from the depots

out of range to the first parallel, which zigzags will be probably not less than 1000 yards in length. As a rule the defenders will not expend ammunition on the first parallel, for

its extent (often several miles) will render the probability of doing material damage extremely small. For this reason also, the dimensions of the parapet and its solidity are of far less importance in the first parallel than in the more advanced works of attack. The first parallel, AAA, fig. 1, being completed, the engineers select points near its extremities, at which they erect breast-works, B, B, to cover

FIG. 1.—Siege Works.

bodies of cavalry, who are kept at hand to resist sorties from the garrison. The length of the parallel is usually made sufficient to embrace all the works of two bastions at least. Sites are then chosen for batteries, C, C, which are built up of fascines, gabions, sandbags, and earth. They are placed at points in the parallel formed by the prolongation of the several faces of the bastions, ravelins, and other works of the fortress, which faces the batteries are severally intended to enfilade by a ricochet fire. Other batteries will be formed for a vertical fire of mortars and shell-guns. By these means it is hoped that the traverses on the hostile ramparts will be destroyed, the guns dismounted, and the defenders dispersed, before the final approaches bring the assailants to the covered way. The sappers will now commence their advance toward the points, or salient angles, of the two bastions to be attacked. If, however, the trench were cut straight toward the fortress, its guns could easily destroy the workmen and enfilade the approach. To prevent this, it is cut in short zigzags—as at D—the direction always being to a point a few yards beyond the outmost flanking works of the garrison. The side of each trench nearest the fortress is protected by gabions and sandbags, as in the case of the parallel. At intervals, short spurs of trench, incipient parallels, are cut, as at E, to contain small-arms-men, to act as guards to the sappers. The second parallel is about 300 yards from the enemy's works and has to be more strongly formed than the first. It often terminates in a reboult, F, to hold some light artillery and a strong force of infantry, who could assail any sortie in flank; or it may run into the first parallel, as G, giving easier access for troops than through the zigzags. The second parallel is revetted with sandbags, in which loopholes are left for musketry. After passing the second parallel, the angles of the zigzags become more acute, to prevent enfilading. At about 150 yards, certain demi-parallel, H, are cut, and armed with howitzer batteries, to clear the covered-way, while riflemen also act from it. The third parallel is at the foot of the glacis. Thence the place, after being sufficiently battered, is taken by a storming-party, who make their way over the glacis, or the covered-way is topped by the double sap, which is a safer plan for the army generally, though much more deadly to the sappers. When the crest of the covered-way has thus been reached, batteries of heavy artillery will be there established, for the purpose of breaching the walls of the ravelin and bastion; while at the same time miners will first seek to destroy the defenders' counter-mines (which would otherwise be likely to send these batteries into the air), and then will excavate a tunnel to the ditch, at the foot of the counterescarp. If the branch becomes practicable, a storming-party will emerge from this tunnel or gallery, and seek to carry the opposite work by hard fighting. If inner works still subsist, which would tear assailants to pieces, the double sap may be continued across the ditch, if a dry ditch, right up the breach, that counter-batteries may be formed. If the ditch be wet, means must be adopted for a causeway or a bridge. By these means, however obstinate may be the defense, if the besieging force be sufficiently strong, and aid do not arrive from without, the ultimate success of the attack becomes certain. Vauban raised attack to a superiority above defense, first, by the introduction of ricochet fire, which sweeps a whole line; and secondly, by originating parallels. Before his time the whole attack was conducted by zigzag approaches; in which the troops actually in front could be but few, and were therefore unable to withstand strong sorties of the garrison, who, in consequence, frequently broke out and destroyed the works of the besiegers, rendering a siege an operation of a most uncertain character.

SIEGE (*ante*). During the war of the rebellion, 1860-65, the following important siege operations occurred: the investment of Yorktown by the army and gen. McClellan, which occupied the month of April, 1862, the position being evacuated May 3; the siege of Charleston, S. C., which continued at intervals during the war, until its evacuation by the confederates in Feb., 1865, after the capture of Columbia by gen. Sherman;

the movement against and siege of Corinth, Miss., April, 15-May, 30, 1861; siege of Knoxville, Tenn., by gen. Longstreet in Dec., 1861; siege of Atlanta, Ga., July, 22-Sept. 1, 1864, by gen. Sherman; operations against Vicksburg, May-July, 1863, by gen. Grant, resulting in its surrender July 4; siege of Petersburg, Va., June, 1864-April, 1865.

SIEGE-ARTILLERY is heavy ordnance used for battering purposes, and of too weighty a character to take the field. A siege-train of guns and their ponderous ammunition is usually maintained in the rear of an army, ready to be brought up for use when required.

SIEGEN, a manufacturing t. of Prussia, in Westphalia, stands on the Sieg, 38 m. s.s.w. of Arnsberg. In 1875 it had 12,902 inhabitants, who are engaged in manufacturing leather, cotton, and woolen goods. Siegen is also said to produce the best iron in the w. of Germany. In the vicinity are numerous iron mines and smelting furnaces. Its iron and steel wares are noted; especially its files, of which 400 different sorts are said to be manufactured.

SIEGERT, KARL AUGUST, b. Germany, 1820; studied art under Hildebrandt, and at the Düsseldorf academy, 1837-46; and has produced many *genre* pictures of great popularity. Among the best are his "Dinner Hour," "Lay Brother distributing Alms," and "Sunday Morning." In 1851 he was made professor of painting at Düsseldorf.

SIEGFRIED. See NIBELUNGENLIED.

SIE'MENS, ERNST WERNER, b. at Leuthe, near Hanover, in 1816. He was educated in the gymnasium of Lubeck and in the school of artillery and engineering of Berlin, and entered the Prussian army as an artillery officer in 1838. He studied chemistry and electro-magnetism and invented a process for electro-plating in 1841. He was the first to explode a submarine mine by electricity (1848). Since 1849 he has been engaged in the establishment of telegraph lines, particularly through Russia, Brazil, Spain, and northern Germany. His researches in electricity have resulted in discoveries and improvements of great value, one of which is the determining of the locations of injuries in submerged cables, and also of charging them in order to reduce the disturbing influence of induced currents.

SIEMENS, KARL WILHELM, a German engineer and physicist, brother of the preceding, b. at Leuthe, near Hanover, 1823. He was educated at Göttingen; went to London in 1843, and founded there in 1853 a branch of the Berlin establishment, making telegraph instruments at Woolwich, and having steel works at Landore in Wales. He is the author of numerous inventions, of which the principal are a process of "anastatic printing;" a chronometric governor for controlling the motion of astronomical instruments; a regenerator for recovering the heat emitted at the exhaust port of caloric engines; a water-meter extensively used in Europe; (in connection with his brother Frederick) a regenerating gas furnace for the production of high-quality steel, and a rotary furnace for making iron and steel direct from the ore. He has been connected with telegraph engineering since 1848. He has published, *On a Regenerative Condenser* (1850); *On the Conversion of Heat into Mechanical Effects* (1853); *On a Regenerative Steam-Engine* (1856); and *On the Increase of Electrical Resistance in Conductors, with Rise of Temperature, and its application to the Measure of Ordinary and Furnace Temperature* (1871). He is D.C.L. of Oxford, a fellow of the Royal society, and a member of all the great technological and scientific bodies of England and the continent of Europe.

SIEN'NA, a city of central Italy, 60 m. s. of Florence by railway. Pop. '72, 22,965. It is situated on three little hills, separated from each other by three valleys, and higher than the other hills surrounding them. Its climate is on this account very salubrious, notwithstanding the deficiency of water caused by its elevated position; to remedy which, subterranean aqueducts had been excavated, 5 m. in length, some of them dating as far back as the Roman dominion. Its environs are not beautiful, consisting of naked clay-hills, capped with sandstone, but the city is surrounded by trees and avenues, which have a fine effect. The handsome square, Piazza del Campo, is one of the finest in Italy. Eleven streets lead out of it, and it is surrounded by handsome buildings. In this square there is also the famous tower called the *Mangia*, of prodigious height; there are also other towers here and there, seen from a great distance—remnants of the inhabitants of the feudal lords. The streets are narrow, some paved with tessellated bricks, and others flagged. There are many ancient Gothic palaces, not remarkably handsome. In the Piazza del Campo stands the Palazzo Pubblico, built in the 13th c., in which there are magnificent rooms, and paintings by eminent artists. Sienna has a fine cathedral, erected, it is said, on the foundations of the temple of Minerva, begun in 1059; the façade built in the 13th century. It is faced with black and white marble, and is covered with ornaments and sculptures. The pavement is of marble tessellated, representing many biblical subjects. In the different chapels, and in the baptistery, there are frescoes, paintings, and statues, by a number of distinguished masters. The other churches are also rich in works of art. Of the many oratories, the

most noteworthy is that of St. Catharine (q.v.), occupying the house of the saint. Sienna is an archiepiscopal see. The Siennese are singularly industrious, and have numerous manufactories of cloth and woolen, silk and linen stuffs, of felt and straw hats, of wax and beet-sugar. There are marble quarries in the neighborhood. There is a university, founded in 1330, famous especially as a school of medicine, which has upward of 100 students. The Italian spoken at Sienna is reckoned among the purest.

Sienna was founded as a Roman colony in the time of Julius Caesar, under the name of Sena, or Sena Julia. There are no remains of antiquity; and it does not appear to have been a place of any consequence until the middle ages, when it became one of the powerful city republics of Italy. It embraced the Ghibelline cause, and in conjunction with the forces of Pisa, defeated the Tuscan Guelphs, in the memorable battle of Monte Aperto (1260). At the height of its greatness it is said to have contained 200,000 inhabitants. Sena produced a "school" of artists, of whom the most distinguished names are Guido da Siena, Simone Memmi, Sodoma, Beccafumi, and Baldassare Peruzzi.

SIENNA EARTH. See BURNT SIENNA.

SIERRA, a name applied in Spain, and in countries in which the Spanish language has prevailed, to a ridge of mountains. The word means *saw*, and is descriptive of the notched or saw-like sky-line of certain mountain-ranges.

SIERRA, a co. in n.e. California, adjoining Nevada on the e.; drained by the forks of the Yuba river; 830 sq.m.; pop. '80, 6,623—3,457 of American birth; 1250 Chinese. The surface is mountainous, as the county lies among the peaks of the Sierra Nevada, of which some are from 6,000 to 8,000 ft. high. The climate is severe; and but a small part of the surface suited for agriculture. Gold is found in large quantities, and there are 6 quartz-mills. Co. seat, Downieville.

SIERRA LEONÉ (Mountain of the Lion), a British colonial settlement on the Sierra Leone coast, western Africa. The settlement consists chiefly of a peninsula, about 25 m. long, from n. to s., and 12 m. broad; but several islets, as the isles de Loss and the Banana islands, belong to it. Area, according to the latest returns, 468 sq.m.; pop. '70, 38,936, a decrease of 2,688 since 1860. There were 255 whites and 38,681 colored; 19,445 males and 19,491 females. Pop. '72, 37,089. The peninsula is bounded on the n. by the Sierra Leone river, and on the s. by Calmont creek and Yawry bay. Along the coast stretches a belt of rich low-lying land, and elsewhere in the colony there are fertile tracts; but the interior is a mass of rugged mountains, with a generally barren soil. The climate is humid and unhealthy—the wet season, lasting from May to November, being specially pestilential. Tropical fruits and plants grow luxuriantly in the more favorable regions, and coffee, sugar, indigo, and cotton have been introduced by the British. In 1872 the exports amounted to £358,636, the chief articles being gold, cotton goods, ground-nuts, palm-oil, hides, palm-nuts, manufactured tobacco, and timber. In the same year the imports amounted to £411,936, and the chief articles were cotton goods (nearly one-half of the whole value), gunpowder, ready-made apparel, hardware, haberdashery, and rum. The revenue in 1874 amounted to £95,325, and the expenditure to £93,643. In 1877 Sierra Leone and Gambia exported to Great Britain goods valued at £176,111, and imported thence to the value of £604,391. The colony is ruled by a crown-appointed governor, assisted by a council. In 1866 Sierra Leone, the Gambia, the Gold Coast, and Lagos were placed under one general government, to be called the "government of the west African settlements."

The settlement of Sierra Leone was established in 1787, when 470 destitute negroes were removed to it from London by a body of philanthropists; and 1196 negroes were sent to it from Nova Scotia—the climate of which had proved too severe for them—in 1790. The population was also increased by other bands of people of color; and after the abolition of the slave trade in 1807, the slaves captured by British cruisers have been put ashore, and settled here. In 1820 the settlement contained only 12,000 inhabitants, or less than a third of its present population.

SIERRA MA'DRÉ, a name given to central portions of the great chain of Cordilleras or Rocky mountains, in Mexico, from lat. 19° to 25° n., and in New Mexico, to the great western range, from lat. 34° to 38° north. These ranges, but partially explored, contain some of the richest silver mines in the world.

SIERRA MORENA, a mountain-range in Spain, on the southern border of New Castile, and between the modern provinces of Ciudad Real and Jaen. It separates the upper portions of the basins of the Guadiana on the n., and of the Guadalquivir on the s., and rises in its highest point to 5,500 ft. above the sea. It is frequently mentioned in *Don Quixote*, and is the scene of many of the incidents therein described.

SIERRA NEVA'DA (*Snowy Range*), a mountain range of Spain in Andalusia, extending e. from Padul, 12 m. s. of Granada, to the frontiers of the modern province of Almería, is 60 m. in length, from 20 to 30 m. in breadth, and covers an area of upward of 1000 sq.miles. It is continued on the n.e. by the Sierra de la Filabras, and

forms a portion of the watershed between the streams that flow into the Mediterranean and those that flow into the Atlantic. The peak of Mulhacen reaches a height of 11,678 ft., and is the highest summit not only of the Spanish peninsula, but of the whole of Europe w. of the Alps. The peak of Veleta is 11,387 ft. high. The range receives its name from the perpetual snow which covers the highest summits. The views from the summits, from which, on the s., may be seen the faint outline of the African coast, on the n. the jagged sierras of the Castiles, can hardly be surpassed in beauty and magnificence by any in Europe.

SIERRA NEVADA, a range of mountains in California, forming a portion of its eastern boundary, is the source of a multitude of rivers, which swell the Sacramento and San Joaquin. The range extends from n.w. to s.e. 450 miles, and is united to the Coast range, which runs parallel with the Pacific, by mount San Bernardino. Among the higher peaks of the Sierra Nevada are Saddle peak, 7,200 ft. high; Table mountain, 8,000 ft.; and the Buttes, 9,000 feet. Here are immense deposits of gold quartz, with steam and water power crushing-mills; deep tunnels and mines, increasing with their depth their yearly product.

SIEYÈS, EMMANUEL JOSEPH, Comte, who, as the abbé Sieyès, prominently figures in the history of the French revolution, was born at Fréjus, May 3, 1748. He was educated at the university of Paris with a view to his entering the church; and on the completion of his studies he obtained the appointment at Treguier, in Bretagne (1775), whence, in 1780 he was transferred to the cathedral of Chartres, of the diocese of which he became chancellor and vicar-general. He had early imbibed the extreme liberal opinions on all matters social and political which were preparing the French revolution; and when, in 1789, the states-general were summoned, he issued his famous pamphlet, entitled *Qu'est-ce que le Tiers Etat?* This work, which claimed for the people political recognition, naturally enough obtained an immense popularity for its author, and procured his election as one of the deputies for Paris. Mainly through his urgency and influence it was that, on June 16, 1789, the representatives of the people took the decisive step of constituting themselves into an independent body, and became the national assembly. Of this body he continued for some time to be one of the most prominent and leading figures. In 1791 he was elected to the legislative assembly, then convened, as member for the department of Paris. By this time, however, he had sunk somewhat from his first pre-eminence; bolder and fiercer spirits had passed him in the race for power and popularity, and where he had once led, he now reluctantly followed. In the convention of 1792, to which he was elected as deputy of the department of La Sarthe, he prudently refrained from any active participation in the debates, and on the occasion of the king's trial he recorded a silent vote. While Robespierre and his party were in power, he consulted his safety by retiring from Paris. When afterward asked what he had done during the reign of terror, he quietly replied: *J'ai vécu* ("I have lived"). On the fall of Robespierre he returned to his post in the convention, and resumed his active interest in affairs, becoming a member of the new committee of public safety. He was engaged chiefly in the department of foreign policy, and he went as ambassador to Holland and Berlin successively to negotiate treaties of alliance. He became a member of the directory in 1799, and among other reactionary measures, he succeeded in closing the celebrated Jacobin club. Perceiving that a stable government was on no other terms possible, he became anxious to secure the co-operation of some powerful military leader, the more particularly as he was ambitious above all things of giving France a "constitution" (of which he had drawn up one or several); and on the return of Bonaparte from Egypt, he entered into a league with him, the result of which was the revolution of the 18th Brumaire (Nov. 9, 1799), and the institution of the consulate. Sieyès, Napoleon, and Roger Ducos being the three first consuls. Speedily, however, Sieyès discovered in his newly ally his master. As to the distribution of power in the new constitution to be formed, he and Napoleon differed irreconcilably; the man of bayonets was the stronger; his political no-trumps never got beyond the paper on which they were written; and finally, in disgust at the subordinate position into which he found himself about to sink, Sieyès threw up his place in the government. As a reward of his services, he received on his retirement a sum of 600,000 francs and the estate of Crosne; afterward exchanged for the equivalent of a splendid hotel in Paris and the lands of Paimanderie, in the park of Versailles. Also the title of count was conferred upon him. Subsequently the presidency of the senate was offered him, but he declined it, and never afterward concerned himself in public affairs. Banished at the restoration, he did not return to France till after the revolution of 1830; and in Paris, on June 20, 1836, he died. During the revolution Sieyès drew up a good many papers of one kind and another; but he is chiefly remembered for his plan of a new constitution, which, however, is very little known. Mignet's *Histoire de la Révolution* contains a description of it; and under the title of *Théorie Constitutionnelle* of Sieyès, and *Constitution de l'An VIII.*, M. Boulay (de la Meurthe) published (Par. 1836) from Sieyès own *Mémoires Inédits* a more detailed account.

SIGEL, FRANZ, b. Zinsheim, Baden, 1824; educated at the military school at Carlsruhe; adjt. in the army of the grand-duke of Baden, 1847. Resigning his commis-

sion in the army he participated in the revolution of 1848, and was appointed minister of war by revolutionary leaders in the same year. He fought against the Prussians, carried the remnant of his forces into Switzerland, and, expelled from thence, took passage for this country, where he taught mathematics in Dr. Rudolph Dalton's academy in New York, and married his daughter. He joined the state militia; commissioned maj. of the 5th regiment. He was a professor in a college in St. Louis, Mo., 1858. At the beginning of the war of the rebellion he entered the union army as col. of the 3d Missouri volunteers, assisting in the capture of camp Jackson, at the battle of Carthage, and at Wilson's creek second in command under gen. Lyon. In charge of a brigade he went through the s. Missouri campaign; was prominent in the battle of Pea Ridge; resigned in 1862; accepted a commission as maj. gen. a month later, and was placed in command of Harper's Ferry. A few months after, he took command of Fremont's army corps, served through the Virginia campaign and the second battle of Bull Run; commanded the dept. of West Virginia, 1864, was register of New York city 1871, and was prominent in politics in 1876.

SIGHING, THE ACT OF, is nothing more than a very long-drawn inspiration, in which a larger quantity of air than usual is made to enter the lungs. This is continually taking place to a moderate degree, and Dr. Carpenter remarks that it particularly occurs when the attention is released, after having been fixed upon an object which has strongly excited it, and which has prevented our feeling the insufficiency of the ordinary movements of respiration. Hence this action is often a simple result of deficient aëration; while in other cases, as is universally known, it is excited by a depressed state of the feelings.

SIGHT, DEFECTS OF. Under this head we shall consider such affections of the eyesight as are due to some known or unknown peculiarity of the optical apparatus (including the optic nerve) not dependent on disease—viz., *short-sight, long-sight, double vision, color-blindness, and night-blindness.*

Short-sight, near-sight, or myopia (derived from the Greek words *myo*, I close, *ōps*, the eye), is often popularly confounded with dim or weak sight; but in reality short-sight applies exclusively to the *range* and not to the *power* of sight, and a short-sighted person may possess the acutest power of vision for near objects. In this affection the rays which ought to come to a focus upon the retina converge to a point more or less in front of it. The cause of this defect probably differs in different persons. It may arise from over-convexity of the cornea or the lens, from undue density or abundance of the humors of the eye, from elongation of the globe in its antero-posterior diameter, or from an imperfect power of the eye to adjust itself to objects at various distances. The distance at which objects are perceived most distinctly by the perfectly normal eye ranges from 16 to 20 in.; an eye which cannot perceive objects distinctly beyond 10 in. may fairly be regarded as short-sighted; and in extreme cases the point of distinct vision may be 3, 2, or even only 1 in. from the eye. Short-sight is frequently hereditary in families. As a general rule the inhabitants of towns are much more liable to it than persons living in the country, and students and literary men are the most liable of all. While in the foot-guards, consisting of nearly 10,000 men, "not half a dozen men have been discharged, nor have a dozen recruits been rejected on account of this imperfection, in a space of 20 years, in one college at Oxford no less than 32 short-sighted men (or *myopes*, as they are termed by some oculists) were met with out of 127" (Donders, *On the Accommodation and Refraction of the Eye*, Lond. 1864, p. 342). The frequency of this affection in the cultivated ranks points directly to its principal cause—tension of the eyes for near objects. The myopia depending, as Donders believes, upon prolongation of the visual axis, this eminent physiologist inquires: "How is this prolongation to be explained? Three factors may here come under observation: 1. Pressure of the muscles on the eye-ball in strong convergence of the visual axis; 2. Increased pressure of the fluids resulting from accumulation of blood in the eyes in the stooping position; 3. Congestive processes in the base of the eye, which, leading to softening, give rise to extension of the membranes. That in increased pressure the extension occurs principally at the posterior pole is explained by the want of support from the muscles of the eye at that part. Now, in connection with the causes mentioned, the injurious effect of fine work is, by imperfect illumination, still more increased; for thus it is rendered necessary that the work be brought closer to the eyes, and that the stooping position of the head, particularly in reading and writing, is also increased. Hence it is that in schools where, by bad light, the pupils read bad print in the evening, or write with pale ink, the foundation of myopia is mainly laid. On the contrary, in watchmakers, although they sit the whole day with a magnifying-glass in one eye, we observe no development of myopia, undoubtedly because they fix their work only with one eye, and therefore converge but little, and because they usually avoid a very stooping position."—*Op. cit.* pp. 343, 344.

So far from short-sightedness improving in advanced life, as is popularly believed, it is too frequently a progressive affection; and every progressive myopia is threatening with respect to the future. "If," says Donders, "it continues progressive, the eye will soon, with troublesome symptoms, become less available, and not unfrequently, at the

age of 50 or 60, if not much earlier, the power of vision is irrevocably lost, whether through separation of the retina from the choroid, from effusion of blood, or from atrophy and degeneration of the yellow spot."

In the treatment of myopia the principal objects are: 1. To prevent its further development and the occurrence of secondary disturbances; and 2. By means of suitable glasses, to render the use of the myopic eye easier and safer.

1. To effect, if possible, the first object, the patient must look much at a distance, but as we cannot absolutely forbid his looking at near objects, spectacles must be provided which render vision distinct at from 16 to 18 inches. Moreover, it is desirable that at intervals of a half hour work should be discontinued for a couple of minutes, and no working in a stooping position should be permitted. The patient should read with the book in the hand, and in writing should use a high and sloping desk.

2. The optical remedy for short-sight obviously consists in concave glasses of a focus suited to the individual case. At first sight it might be supposed that glasses with a concavity exactly sufficient to neutralize the defect in the eye would always suffice; and when the glasses are used exclusively for distant vision (for example, in the double eye-glass, which is only at intervals held before the eye), or when the affection is slight, and the eye is otherwise healthy, perfect neutralization is admissible; but so many circumstances forbid the complete neutralization of the myopia that an oculist of reputation should always, if possible, be consulted as to the choice of spectacles. Glasses, if injudiciously selected, usually aggravate the evil they are intended to remedy; and in connection with this subject we must warn our readers against the prevalent habit of employing a single eye-glass; it is most prejudicial to the eye which is left unemployed, and often leads to its permanent injury.

Long-sight and *presbyopia* (derived from the Greek words *presbys*, an aged person, and *ōps*, the eye) are usually considered by English writers as synonymous terms. Donders, who is now universally accepted as the highest authority on this department of eye-affections, maintains that "the term *presbyopia* is to be restricted to the condition in which, as the result of the increase of years, the range of accommodation is diminished, and the vision of near objects is interfered with." As from youth up to extreme old age, the vision of near objects becomes progressively more and more difficult, it is impossible to fix any limit as the commencement of *presbyopia*. In practice, however, a word is required which indicates the condition in which the eye, at an advanced period of life, and sometimes sooner, requires convex spectacles for distinct near vision, as, for example, for reading, and this word is *presbyopia*. In this state, the nearest point of distinct binocular vision is found to lie about 8 in. (or double the ordinary distance) from the eye, and at this point Donders arbitrarily places the commencement of *presbyopia*. This condition, which is as natural a concomitant of advanced life as gray hairs or wrinkles, is occasionally met with in young persons. In these cases, it generally arises from intestinal irritation, and may be a precursor of amaurosis; hence such cases should be carefully watched. In ordinary *presbyopia*, the defect is at once remedied by the use of glasses of low convex power, as of 30 or 24 in. focus, which should, however, only be worn during reading and writing, and not constantly. Although the improper use of convex glasses is not by any means so dangerous as the inconsiderate use of concave glasses, the advice of a good oculist regarding the choice of spectacles is well worth his fee.

Double vision, or *diplopia*, is of two kinds. It may arise from a want of harmony in the movements of the two eyes, the vision of each eye singly being perfect; or there may be double vision with one eye only. The first form may occur (1) in cases of squinting, or (2) in cases of paralysis of one or more of the muscles of the orbit. In cases of squinting (q.v.), the vision of the most distorted eye is almost always imperfect; and it is well known that impressions on the two retinæ are similar in kinds but dissimilar in form. The mind takes cognizance only of the former; so that a person with a bad squint sees objects with the sound eye only. But if the sight of both eyes is nearly equal, as often is the case when the squint is not very well marked, double vision results whenever both eyes are employed together, in consequence of images of nearly equal intensity falling on non-corresponding parts of the two retinæ. This variety of double vision, although annoying, is perfectly harmless. When double vision arises from muscular paralysis, disease of the brain of a serious nature is to be apprehended, although the affection sometimes appears to arise from exposure to cold. The second form of double vision—viz., double vision with a single eye—is a much more rare affection than the preceding one, and depends upon some irregular refraction of the cornea or lens.

Color-blindness is noticed under its own name.

Night-blindness, or *hemeralopia* (from the Greek, signifying "day-sight"), is a peculiar form of intermittent blindness, the subjects of which see perfectly with an ordinary light, but become entirely and almost instantaneously blind as soon as twilight commences. It is seldom met with in this country except among sailors just returned from tropical regions. It is frequent among the natives of some parts of India, who attribute it, as our own sailors do, to sleeping exposed to the moonbeams. The most probable cause of the affection is, however, exhaustion of the power of the retina from over-excitement from excessive light, so that this organ is rendered incapable of appreciating the weaker stimulating action of twilight or moonlight. All that suggests itself in the

way of treatment is to protect the eyes from strong light during the day, and to prescribe quinine and a nourishing mixed diet.

Snow-blindness must be regarded as an allied affection to the preceding.

SIGHT OF A GUN. See GUNNERY.

SIGILLARIA, a genus of fossil plants which are of importance because of their singular structure, and their remarkable abundance in the coal measures. They seem to have contributed more than any other genus of plants to the formation of coal. The roots of *sigillaria* are found preserved in the shale which forms the floor of all coal-seams. These roots were originally supposed to be distinct plants, and have received the generic name of *stigmaria*. The most feasible notion, and that generally accepted regarding them, was that they were fleshy water-plants, with numerous linear leaves, articulated to the stem by papillae, which were buried in deep cylindrical hollows in the stem. Brongniart first suspected that they were roots, and Binney placed the question beyond doubt by discovering a specimen in which the trunk of a *sigillaria* rose from the crown of a *stigmaria*. Several observers have subsequently seen these fossils also in actual contact. It is believed that the mud (now converted into shale) in which they grew was very soft, and easily permitted the passage of the large roots, while they gave off all around innumerable large hollow rootlets. The stems of *sigillaria* are abundant in the coal-beds. They are marked by parallel longitudinal flutings, and regular scars formed by the base of the leaf-stalks, which had fallen off. They are known to have attained a height of 70 ft. and a diameter of 5 feet. The stem rose without branching till near the summit, when it branched several times dichotomously. The proportion of woody matter to cellular tissue in the stem was very small. The woody fiber is characterized by the abundance of scalariform vessels, similar to those which occur in *lepidodendron*, and in the recent vascular cryptogamia. The stem is seldom found preserved so as to exhibit any structure, or even its cylindrical form; it generally occurs as a double layer of coal, showing on the outer surfaces the scars produced by the bases of the leaf-stalks. The form and arrangement of these scars have been used to distinguish the species, and, indeed, no other materials exist, for hitherto no foliage of any kind has been certainly found connected with the trunks. The restoration of the genus has been consequently quite imaginary. Some, with Brongniart, have supposed that the trunk terminated in a crown of simple leaves, like that of many palms, and that it was a gymnosperm near to the cycads. Others, with King, consider that the fronds of *pecopteris nervosa*, which are very abundant in the coal measures, are its foliage, and they would restore it so as to have the appearance of a modern tree fern. And others, with Binney, consider that its affinities are nearer to *lepidodendron*, and that some of the numerous fragments which have been referred to this genus may really be the branches of the *sigillaria*. They would restore it as if it were a huge *lycopodium*, and refer to it some of those fruits which, under the names of *lepidostrobus* and *flemingites*, have been described by Brown, Hooker, and Carruthers.

SIGISMUND, Emperor of Germany (1411-37), was the son of the emperor Karl IV. He was well educated, and having married Maria of Anjou, on her accession to the throne of Hungary he became chief administrator of that kingdom. The death of his wife in 1392 made him king of Hungary; and at the head of a numerous army of more than 100,000 men, composed of Hungarians, French, Germans, and Poles, he attempted to relieve the Byzantine empire from the fierce Turks, but was terribly defeated at Nicopolis (Sept. 28, 1396). On his return to Hungary, he found on the throne a new monarch, Ladislas of Naples, who imprisoned him (1401); but through the good offices of his elder brother, Wenceslas, he was freed, and obtained the throne (1402), rewarding his elder brother by snatching from him his kingdom of Bohemia, which he retained for some time. In 1411 he was proclaimed emperor, on the death of Rupert. He was present at the council of Constance, which he had prevailed upon pope John XXIII. to hold for the purpose of putting an end to the Hussite and other schisms. He contented himself with protesting against the violation of the imperial safe-conduct which was given to Huss, and ultimately consented to his judicial murder, for the purpose, as his apologists say, of conciliating the council, and so settling the disputes concerning the papacy. His succession to the throne of Bohemia, after his brother's death, was opposed by the Hussites, who were now in insurrection; and after a fruitless attempt to conquer them, he confined himself to the defense of Hungary against the Turks, whom he defeated in a great battle near Nissa (1419). For ten years afterward, he left Germany very much to the guidance of its self-willed petty rulers, who speedily brought the country into such a deplorable state that they were glad to beseech Sigismund to return to the helm of affairs—which he did, but with little good effect. He obtained, by concessions to the Calixtines (q. v.), the crown of Bohemia in 1436; but once on the throne, he gradually withdrew these concessions, which provoked such discontent that his death (1437) alone averted a civil war. Sigismund possessed a large intelligence, and remarkable political talents, but these were much neutralized by his impetuosity, indecision, selfishness, and extraordinary avarice; and his well-meaning endeavors after peace and improvement ended in nothing. Carlyle distinguishes Sigismund by the epithet *supra grammaticam*, in allusion to his answer to a cardinal at the council of Constance, who

ventured to correct his majesty's grammar—"I am the Roman king, and above grammar."

SIGISMUND, worthily surnamed the **GREAT**, King of Poland, was the youngest son of Casimir IV., and was born at Koziénicé, 1467. He was chosen grand duke of Lithuania, 1506, and succeeded to the kingdom of Poland on Dec. 8 of the same year. The affairs of Poland and Lithuania were at that time in a sad condition; the southern portions of the country reduced almost to a desert by the ravages of the Tartars, while the east was continually in dread of the Russians, who had become an independent, united, and powerful monarchy. The Russians invaded Lithuania, and conquered some provinces, but Sigismund gained a brilliant victory over them at Orsza on the Dnieper (July 14, 1508). Bogdan, prince of Moldavia and Wallachia, now invaded the southern provinces, as that semi-barbarous race were accustomed to do without let or hindrance; but he was so decisively routed on the banks of the Dniester, that he gladly agreed to acknowledge himself a vassal of Poland. Disregarding the suggestions of the pope to head a crusade against the Turks, Sigismund next read the Tartars, through his gen., Ostrogski, a very forcible lesson, in 1512, against aggressive practices, which cost them 27,000 men, and assured the tranquillity of his frontier for a long period. His alliance in 1513 with Stephen Zapoli, voyvode of Transylvania, whose daughter, Barbara, he also married, alarmed the emperor Maximilian, who incited the Russians to resume their aggressions, which that ill-advised nation cheerfully agreed to do; paying dearly for their rashness, for their army of 80,000, which had invaded Lithuania, was met and cut to pieces (Sept. 8, 1514) by Ostrogski, with 32,000 men, at Orsza, leaving its standards, cannons, and other arms, 2 generals, 37 princes, 6,000 prisoners, and 30,000 dead in the possession of the enemy. Subsequent invasions of Moscovites and Tartars were repelled as before, and a rebellion of the Wallachs was punished by numerous defeats, chief of which was that of Obertyn (1531). The insolence of the Teutonic order, who had invaded Polish Prussia, was effectually chastised by Sigismund, who defeated their grand master Albert, his own nephew, in two great battles, in the latter of which the knights were assisted by the Danes (1520). In 1525 he agreed to confer on Albert the title of duke of Prussia (now known as East Prussia), on condition of fealty and homage. The dukes of Prussia continued as vassals of the Polish crown till 1657. In 1526 Sigismund alone of the monarchs of Christendom lent aid to Hungary against the formidable array of Solymán the magnificent, and a numerous force of Polish cavaliers fought bravely on the fatal field of Mohacz (1526). The only other important event of Sigismund's reign was the introduction and extension of Lutheranism in Poland, a change which Sigismund did nothing to prevent, only taking precautions, and sometimes severe ones, against its affecting the civil and political condition of the country. It is told of him that, when John Eck exhorted him to take severe measures with the Lutherans, whom he compared to goats among the sheep ("the faithful Catholics"), Sigismund replied that he was desirous of being "king of goats as well as king of sheep." After a long and glorious reign, Sigismund died at Cracow, April 1, 1548, leaving the character of a just, wise, and magnanimous prince, who had restored to his country its ancient prosperity, and had raised it from the very feet of its enemies to a worthy superiority over them.

SIGMARINGEN. See HOHENZOLLERN, *ante*.

SIGNALS are the means of transmitting intelligence to a greater or less distance by the agency of sight or hearing. Incomparably the most powerful medium yet known for this purpose is the electric current. See TELEGRAPH. Sound signals have obviously but a short circuit. The electric current requires fixed apparatus establishing an actual communication between the two points; and is therefore inapplicable to the ordinary cases of ships interchanging signals with each other or with the shore; and, except under unusual circumstances, it would not apply to armies manœuvring in the field. For these purposes, so far as present knowledge extends, signals by sight or sound must always be the resort. For railway signals, see RAILWAYS.

The ancients seem to have elaborated a fair system of night-signals by torches for military purposes; but in naval affairs the ships sailed so close together that orders could be communicated by word of mouth, while the turning of a shield from right to left sufficed as sailing directions to the several lines. In modern times signaling between ships has become indispensable; but there is probably no department of practical science in which progress has been slower, and every so-called system of signals has been distinctly without any system whatever. In the time of James II. a signal could only be expressed by flags, in confusing number, hung in different parts of the vessel. By the commencement of the present century, thanks to sir Home Popham and other inventors, the system had been adopted of hanging a number of flags under one another, each symbol or combination having an arbitrary conventional meaning attached to it. Alterations in the specific flags have been made from time to time, but essentially this is the system now in use. The flags are either square, triangular of the same length, or pendants which are pointed and longer. These are of black, white, red, blue, and yellow (in the Austrian service alone green is added) in mass or in combination. Specimens of the flags in use in the present naval code are shown in Fig. 1. The signalmen find, how-

ever, that at a distance blue, red, and black are

not readily distinguishable, nor yellow from white. It has consequently been the recent tendency, and apparently most justly, to reduce all the signs to black and white, singly or in combination, trusting to shape for different signals.

There are, however, disadvantages attending flags. In a still day they are difficult to read; or the wind may so blow that they are only seen end on. At sea the motion of a ship will generally neutralize these drawbacks; but

FIG. 1.

the case is otherwise on shore, and it may consequently occur that the ship can communicate to the land, but cannot get a reply. To obviate this signals representing solid figures are sometimes employed. To fulfill their conditions they must appear the same in whatever lateral direction seen. But this limits the shapes to cylinders, cones, and the sphere, or combinations of those figures; and as the total number of distinguishable signs is reduced, signaling becomes reduced from the word-signal to the telegraph. This distinction should be clearly understood, as much is involved in it. A word signal, as in the present system, is where the whole word or message is sent up at once, and flies simultaneously; a telegraph signal is one in which the letters composing the word or numbers representing the signal are shown separately, and each is removed before another is shown. At sea the word-system is best, for it involves no act of memory; and memory, even from signal to signal, is found difficult by signalmen in the turmoil of perhaps storm or fighting. On the other hand, the telegraph system involves far simpler apparatus, and the changes can be effected more rapidly. As regards the actual time required for a message, the word-system has the advantage in a message short enough for the whole to be shown at one time; but otherwise the difference is not material. If all advantages be balanced, it is probable that the telegraph system will eventually supersede the other entirely. Whether the word or the telegraph system be practiced, another question is, whether to spell each word, or to use numerals and a code. Under the latter principle about 14,000 of the words and sentences most commonly sent are arranged for easy reference in the signal-book. With the addition of 1 or 2 repeating symbols the 9 numerals and 0 give combinations 4 together to this number. A combination of figures is arbitrarily assigned to each expression; and the expression is communicated by representing those figures in their proper order. With the book of reference at hand, and intelligent signalmen, there can be no doubt of the superior rapidity of the "code." A code has also this further advantage, that, the signals representing things and not words, it can be made international, the same symbols representing the same idea in every language. It is then only necessary for universal signaling that each nation should concur in the meaning to be attached to the several signs. Many gentlemen of ability have devoted their attention of late years to the simplification of signals; among whom conspicuous positions must be assigned to col. Grant, col. Bolton, Mr. Redl, and capt. Colomb, R.N. Their principal object has been so to simplify the telegraph system that signals may be made with any apparatus, or without apparatus at all. To accomplish this they have, to a great extent, alighted color and resorted to form and motion. Among the form telegraphs there is the principle of the old semaphore (q.v.), in which each letter or number is shown by the position of two arms, as in Fig. 2. The arms are heavy, and involve mechanism; besides which they are not always clear on a ship in motion beyond a short distance. Very superior in visibility and simplicity is Redl's system of cones. This consists of 4 cones fixed to a mast. The cones are collapsible, and are formed in a similar manner to umbrellas. Their usual condition is shut, and they can only be held open while a rope attached to each is pulled. With cones of 3 ft. base, signaling is rapid and clear up to 5 m., and the mast can be inserted at any place. The system is very simple: each cone represents a number, 1, 2, 3, or 4; then 1 and 4 shown represent 5; 2 and 4, 6; and so on, as in Fig. 3. This very elegant system can be applied in military or naval operations. But its chief beauty is that a person understanding it can make the same signals without the cones; for example, if a black flag represent an open cone, and a white flag a shut cone, a ship with 4 black and 3 white flags can make every signal. Again, the arm raised horizontally may represent the open cone; against the body, the shut cone; then two men standing on a cliff are as good as any signal-post—see Fig. 4. Or if one person only be present, he may represent an open cone by raising his arm with a handkerchief extended, and a shut cone by his arm without the handkerchief. He has only then to raise his arm four times in quick succession, with or without the handkerchief, to make the required signal. We have thus arrived at a universal system of the utmost simplicity, which in war, and especially during invasion, might be of inestimable benefit to the nation. The code of signals cannot be too generally diffused by the government, in order that every man among the

FIG. 2.—Semaphore System.

public may become an amateur signalman on emergency. A secret code, in which the same numbers have different significations, could always be maintained for state purposes.

It only remains to apply the same system to night-signals. The old naval principle has been to hang dingy lanterns in various shapes—triangles, squares, crosses, etc. Besides requiring large bases to be at all visible, this has been found from the motion of a ship to be nearly useless. Redl's system has been applied by hanging four lanterns in

FIG. 3.—Cone System.

FIG. 4.

a vertical line to represent the cones, and obscuring those which corresponded to shut cones. An improvement was found in introducing a red or green light in the middle, to show the relative position of the four. The best night-signals are, however, flashing lights, as introduced by col. Bolton, and more elaborately by capt. Colomb, and adopted in the navy. This consists of a bright light, covered by a shade, which shade, by mechanism, can be lifted for any given time, exposing the light meanwhile. A flash of about half a second's duration is negative: a line of $1\frac{1}{2}$ seconds, positive. Four exhibitions of the light then represent a symbol as in Redl's cones. If the same nomenclature be adopted we should signal as in Fig. 5. It will be seen at once that this system produces results similar to Morse's electric telegraph. If the distance be within a mile or so, and the weather still, a bugle will answer equally well, long and short notes representing the positive and negative cones.

FIG. 5.

The fundamental principle of the foregoing system of universal telegraphy, applicable by night or by day, by sight or by sound, is to employ two signals only—one positive and one negative—and to regulate their exhibition by periods of time.

SIGNAL SERVICE OF THE UNITED STATES. At the time of the organization of the department of meteorology of the army signal office (see METEOROLOGY) there was no general system in operation for "simultaneous meteorology," and the one ever since in use was devised and carried into effect by gen. Myer (q.v.), chief signal officer. By this system the innovation was introduced of observing and reading off the instruments, "at the same moment of actual (not local) time." By this arrangement the signal office at Washington can call for and receive reports from all parts of the country, taken at each of the stations, at any hour of the day or night. Thus, the exact condition of the atmosphere over the whole field of inquiry is set down at a given instant, establishing the existence of conditions on which predictions may be and are fearlessly made. In Nov., 1871, a comparison of the tri-daily forecasts, or "probabilities," as they were styled, showed a verification of 69 per cent, which rose to 76.8 per cent by 1872. These results afforded the best elucidation and the most complete demonstration of the law of storms and the movements of cyclones that had ever been obtained in any country." In 1872 and 1873 the expansion of the work of the signal office was very great; extending, through the cordial aid of agricultural societies, into a comprehensive weather-bureau sustained in the interest of agriculture; and, through its connection with life-saving and signal stations, becoming a most certain and effective agent for saving life and property endangered by storms on the sea. "Indication" and "cautionary signals," based upon three series of simultaneous weather-reports telegraphed to Washington daily, are issued from the office of the chief signal officer three times each day, and are printed in all newspapers where it may be important to do so, and otherwise made public. The preparation of a graphic weather-map embodying the telegraphic data furnished to the chief signal officer every eight hours, preserves an accurate picture of existing aerial phenomena, and the conditions on which storm predictions are made. The "Farmers' Bulletins" are reprinted by signal-service observers in 19 cities, and the telegraphic forecasts are circulated among 6,042 sub-centers in agricultural communities, and thence distributed among the farmers. As the predictions cover twenty-four hours, and often hold good for twice that period, they reach the denser rural populations sometimes a day and a half and always as much as fourteen hours before the period to which they apply expires. The railroad system has co-operated in this service, and 103 railway companies distribute daily 3,180 reports to as many railway stations, without charge.

Cautionary signals are of two kinds: 1. Those premonishing dangerous winds to blow from any direction; 2. Those premonishing off-shore winds, likely to drive vessels out to sea. The first, distinctively termed the "cautionary signal," consists of a red flag with a black square in the center, for warning in the day-time, and a red light by night. The second, or "cautionary off-shore signal," consists of a white flag with black square in the center shown above a red flag with square black center by day, or a white light shown above a red light by night, indicating that while the storm has not yet passed the station, and dangerous winds may yet be felt there, they will probably be from a northerly or westerly direction. The percentage of verifications for the year ending June 30, 1879, varied between 79.8 and 93.8.

SIGNATURE, in music. In writing music in any key with sharps or flats, the sharps and flats belonging to the key, instead of being prefixed to each note as required, are placed together immediately after the clef on the degrees of the staff to which they belong; and this collection of sharps or flats is called the signature. The signatures of the several keys generally in use are as follows:

MAJOR.	G	D	A	E	B	F \sharp
						
MINOR.	E	B	F \sharp	C \sharp	G \sharp	D \sharp
MAJOR.	F	B \flat	E \flat	A \flat	D \flat	G \flat
						
MINOR.	D	G	C	F	B \flat	E \flat

The minor keys take the same signature with the major keys a third above them.

When a new key is introduced in the middle of a piece of music, the signature of the former key must be contradicted, and that of the new one appended. Thus a transition

from the key of D major to that of D minor is indicated thus: ; from B

major to B minor: ; the sharps which are to continue being, in this

last case, for distinctness' sake, appended in addition to the contradiction of those that are to be discarded. A transition to another key, which is not to continue for any length of time, is seldom indicated by a change of signature; but the sharp, flat, or natural sign is appended to any note as required, that sign affecting all the following notes of the same letter in the measure in which it occurs, unless contradicted. A sharp, flat, or natural thus introduced is called an accidental. Two accidentals are required in the ascending scale of every minor key, to sharpen the sixth and seventh of the tonic.

Besides the signature of the key, a signature of time precedes every musical composition. It consists of two figures placed over one another as a fraction, the denominator 2, 4, 8, or 16 standing for minims, crotchets, quavers, or semiquavers (i.e., halves, fourths, etc., of a semibreve), while the numerator points out how many of these fractional parts

of a semibreve are contained in each measure. Thus, $\frac{2}{4}$ indicates that there are two

crotchets, and $\frac{3}{8}$ three quavers in the measure. When there are four crotchets (or

a semibreve) in the measure, it is usual to write $\frac{4}{4}$ instead of $\frac{4}{4}$.

SIGNATURE, in printing, denotes the letters which are placed at the bottom of the first page of each sheet of a book, to facilitate the arrangement of the several sheets in the volume. The letters employed are those of the alphabet with the exception of J, V, and W, three letters which have been invented since the use of signatures was introduced. See ALPHABET. As the first sheet of a work, containing the title-page, dedication, preface, etc., is generally printed last, the letter A is reserved (along with small letters, *a*, *b*, etc., should there be more sheets of introductory matter) for this, and the signatures commence with B; after reaching Z, they commence again at the beginning of the alphabet, the letter being doubled for the sake of distinction, as AA, or Aa, or more frequently 2A. Should the alphabet again be exhausted, 3A, 3B, etc., are next employed, and so on. This is the method employed in Britain; in France and

Italy, figures are generally used. Signatures (as B2, B3, etc.) are also placed on certain pages of the same sheet, as a further direction to the book-binder.

SIGNET, in England, one of the seals for the authentication of royal grants. Prior to 1848 all letters-patent and other documents which had to pass the privy seal required first to have the signet affixed, and passed from the signet-office to the office of the privy seal in the form of signet bills, verified by the signet-seal and superscription and the signature of the clerk of the signet. By act 11 and 12 Vict. c. 82, however, warrants under the royal sign-manual, countersigned by one of the principal secretaries of state, have been made *per se* sufficient authority for the privy seal to be affixed, and the signet-office has been abolished. The signet in Scotland is a seal which seems to have been originally intended to authenticate royal warrants connected with the administration of justice. The principal class of agents or attorneys in Scotland are called writers to the signet, it is said from their having been originally clerks in the office of the secretary of state, by whom writs passing the signet were prepared. See WRITERS TO THE SIGNET.

SIGNING, SEALING, and DELIVERY of a deed, in English law, is the mode of executing a deed. The main acts are, however, the sealing and delivery, for signature is not absolutely essential—at least in some kinds of deeds known to English law. The use of the seal is an ancient form of authenticating deeds, still kept up in England, though long superseded in Scotland by simple subscription. In practice, a wafer or seal is attached to the end of the English deed, and the party who executes it must, after signature, put his finger on the seal, and say: "I deliver this as my act and deed," at the same time handing the deed to the person who is to have the custody thereof.

SIGN-MANUAL, ROYAL, the subscription of the sovereign, which must be adhibited to all writs which have to pass the privy seal or great seal. When attached to a grant or warrant, it must be countersigned by one of the principal secretaries of state, or by the lords of the treasury. The sign-manual, in practice, consists but of the initial of the sovereign's name, with the letter R added, for *Rex* or *Regina*.

SIGOURNEY, Mrs. LYDIA HUNTLEY (Huntley being her maiden name), American authoress and poet, was b. at Norwich, Conn., in 1791. She was, like most young ladies of ability in New England at that period, early engaged in teaching, and much of her early writings consist of tales, essays, instructive letters, and poems, for her pupils and the young. Her first published work was a volume of poems in 1815. In 1819 she was married to Mr. Charles Sigourney, a merchant of Hartford. In 1822 she published a descriptive poem on the *Traits of the Aborigines of America*; and in 1824 a *Sketch of Connecticut Forty Years Since*. These were followed by *Pocahontas and other Poems*, *Lays of the Heart*, *Tales in Prose and Verse*, etc. In 1840 Mrs. Sigourney visited Europe, and on her return, with a freedom common to American authors, wrote her *Pleasant Memories of Pleasant Lands*. She compiled amusing and instructive books for the young, and was a constant contributor to magazines and other periodicals of poems, whose subjects, style, and sentiment gave her the designation of "the American Hemans." She died at Hartford, June, 1865.

SIHUN'. See JANAITES.

SIKHS. The term Sikh, a corruption of the Sanskrit *s'ishya*, signifying "disciple," is applied to a community of which the Punjab, in northern India, constitutes, substantially, the confines. Less commonly, even among themselves, the members of this community are also known as Sinhs (vulgarly Singhs), that is, "lions," a title given them by Govind, the last and most influential of their hierarchs. Every name of a Sikh male now terminates with the word Sinh.

Originally a body of mere religionists, the Sikhs, what from the energy which they developed under repression, and the inducements to join them which they offered as proselytizers, grew, by degrees, in strength and numbers, and ended in a formidable nationality. Their originator, Nānak, was born in 1469, in the vicinity of Lahore, and died in 1539, not far from the place of his nativity. To him succeeded, in turn, nine pontiffs, each of whom, like himself, is popularly denominated guru, or "teacher." These were Angad, Amardās, Rāmdās, Arjunmall, Hargovind, Harrāy, Harkrishna, Teghbahādar, and, finally, Govind.

The aim of Nānak was pointedly humanitarian, and designed to combine Hindus and Mohammedans, at the cost of what he held to be only unimportant compromise, into one harmonious brotherhood. Sufficient proof of the comprehensive character of his scheme is afforded by the circumstance that he accepted concurrently the incarnations of Neo-Brahmanism and the mission of the Arabian prophet. His three immediate successors, while zealously protecting the interests of the infant sect, avoided secular pursuits, and held themselves aloof from political complications. Arjunmall, however, not content with signalizing himself as compiler of the *Adigranth*, and as founder of Amritsar, the holy city of the Sikhs, engaged with ardor in trade, and rendered himself conspicuous as a partisan of the rebellious prince Khusrū, son of Jahāngir. Hargovind, who came after Arjunmall, called the Sikhs to arms, led them in person to battle, and though he remitted nothing of his assiduity as a guru, became an active and useful, though sometimes refractory, adherent of the Great Mogul, against whom his predecessor had plotted. Harrāy subsequently espoused the part of Dārū Shukoh, when con-

tending with his brothers for the throne of India. Harkrishna, son of Harrây, died a child, and was only nominally a guru. Teghbahâdar, after a career of turbulence, was executed as a rebel, by command of Aurangzeb, at Delhi. However deficient in the qualifications demanded for spiritual leadership, it can scarcely be doubted that he contributed, to an important degree, in preparing for the complete change of Sikhism which was effected by his son, Govind. The chief motive that instigated Govind, the tenth of the "teachers," to bring about this change was, with some probability, a desire to avenge the ignominious death of his father. He resolved to combat the Mohammedan power and, in deviation from the principles enunciated by Nânak, the Mohammedan religion as well. But Hinduism, with its social restrictions of caste, its fantastic fictions, and its irrational idolatry, likewise fell under his ban. God, he inculcated, is not to be found save in humility and sincerity. In what measure he was a man of thought is evinced by his legacy to his co-religionists, the second volume of the Sikh scriptures. A Sikh, it is therein taught, is to worship one God, to eschew superstition, and to practice strict morality, but equally is to live by the sword. The purport of this last injunction is unmistakable. Govind was assassinated, while in the imperial service, in 1708, on the banks of the Godâvari. He died, it is true, without beholding the fulfillment of the purpose for which he had striven; but he had, nevertheless, succeeded in stirring his followers to an ambition for political independence—an idea which was ultimately transformed into a reality. His successor, but only as a temporal leader, Banda, suffered a cruel death. He did but little to advantage his sect; and his memory is not held in reverence.

With the decline of the Moghul empire, the might of the Sikhs, in spite of their intermittent reverses, steadily increased, until, in 1764, they convened a general assembly, formally assumed the character of a substantive nation, and issued coin from which the name of the emperor was omitted. Their commonwealth was still denominated, as it had been by Govind, Khâlsa; and the component states of the federation, ordinarily said to have been twelve in number, were thenceforward distinguished as Mislis. Foremost in influence among these states was that of Sukarchakiyâ, the chieftain of which was Mahâ Singh, for whose son, the famous Ranjit Singh (Runjeet-Singh, q.v.), it was reserved to consolidate the Mislis into a unity subject to his own undivided control. The virtual headship of Ranjit Singh dates from the year 1805, though it was not until 1838 that he attained the zenith of his ascendancy. He died in the year following, at the age of 59. During 1845 and 1846 the Sikhs ceased to exist as a nation; and their country has since been ruled by the English. Yet every loyal Sikh is still confident that his people is suffering but a transitory depression, and that it is destined to retrieve, and even to surpass, its bygone glory. In the meantime, the reputed son of a wife or concubine of Ranjit Singh, Dilip Singh, is a pensioner of the British government, has professed Christianity, and has taken up his abode in England.

Ethnologically considered, the Sikhs are, in large proportion, of Jât origin; the Jâts, whom some take to be one with the classical Getae, being a tribe extensively diffused over the n. of India. But other Hindus have helped to swell their ranks, and also not a few Mohammedans. The ten gurus are accounted Kshatriyas, or of the second Brahmanical caste, the martial. The descendants of these several races, from intermarriage and other causes, cannot, however, now be discriminated; and there is no division of the multifarious population of India that strikes more than the Sikhs, as respects physical uniformity. For symmetry and comeliness, and, it may be added, for courage and powers of endurance, the lions of the Punjab are altogether remarkable.

Nânak's was, undoubtedly, by far the most successful of the repeated attempts which have been made to fuse together the incompatible dogmas of Hinduism and Islamism. None of the authors of these attempts seem, indeed, to have been acquainted with other than the mere surface of the two religions which they would have blended into one. With the Mohammedan, the existence of the Deity as a pure spirit, and his creatorship of the world, are fundamental postulates. On the other hand, the radical doctrine of the Hindu is pantheism, agreeably to which the universe, alternatively God, is a single eternal substance, under the twofold aspect of spirit and matter. These sets of first principles, which Nânak and his fellow-reformers could never have clearly apprehended, are palpably impossible of reconciliation. Without rejecting all that is distinctive of his creed, no Hindu can assent to the theology of Islam; and, conversely, every intelligent follower of the Arabian prophet must be aware that the monism and metempsychosis of Brahmanism are utterly antagonistic to the leading positions of his own faith. Govind, as we have seen, openly repudiated the notion of amalgamating Hinduism and Mohammedanism. An opportunity of becoming acquainted with his real views and those of Nânak in their fullness has been provided for English readers by Dr. Trumpp's translation (London, 1877) of the *Adigranth* (the Original Record). The *Granth* contains also extensive quotations from Kubir and other predecessors of Nânak. A second *Granth*, by Guru Govind Singh, has not yet been translated. These voluminous compositions are metrical throughout, and are in an archaic Indian vernacular, older than Hindi and Panjabi. They are written in the same character as the Sanskrit, the values of the letters being altered, though their forms are retained.

Among the numerous divisions into which Sikhism, as a system of belief and practice, has ramified, two at least, apart from the great central sect, deserve specification.

First are the Udâsts, professors of indifference to mundane concerns; a sect whose origin is attributed to S'richand, a son of Nānak. These recluses, whom Amārdās refused to recognize as genuine Sikhs, have, to this day, numerous disciples. The Akālīs sprang up just after the time of Govind. For extravagance of fanaticism, these Ishmaelites have, it is hoped, no rivals; and the style of their piety is comparable with that of a Thug.

As specimens of the superstitions of the Sikhs, it may be noted that, like the Hindus, they look upon the eating of beef as a deadly offense, and that, like the modern followers of Zoroaster, they attach sinfulness to the act of extinguishing a light with the breath. Some illustrations of practical Sikhism may also be gathered even from the few remarks that have been made touching the gurus. It is not irrelevant to add, that Amardās humanely discountenanced the cremation of widows, and that Arjunmall committed suicide. The morality of ordinary Sikhs is as positively maintained by one class of writers as it is denied by another. Evidence should seem to show that the agriculturists among them are much on a par, as to correctness of life, with other Indian cultivators of the soil. As to their soldiers, however, it has been observed that they are deeply tainted with those repulsive impurities for which the Persians are so infamous. Though forbidden the use of tobacco, they are under no restriction as concerns indulgence in bhang, opium, and intoxicating drinks; and it would be gross flattery to commend them on the score of sobriety. As regards morality, there is reason to believe that they have greatly degenerated since the days of Govind.

The gross Sikh population has been most variously estimated by different statisticians, some of whom compute it at considerably less than half a million of persons, while others deem a million and a quarter, or even a million and a half, to be not excessive.

For the most satisfactory extant treatment of the subject of this article, the reader is referred to capt. J. D. Cunningham's *History of the Sikhs*. Sir J. Malcolm's *Sketch of the Sikhs*; *The Asiatic Researches*, vols. i. and xi.; the collective works of prof. H. H. Wilson, vols. i. and ii.; and *The Calcutta Review*, vols. xxxi. and xxxiii., may likewise be consulted with advantage.

SIKH WARS, two brief but desperate contests waged between the British power in India and the Sikhs in 1845-46, 1848-49, which resulted in the destruction of the latter as an independent nation. The first had its origin in the dissensions which convulsed the Sikh country after the death of Runjeet Singh (q.v.), and which necessitated the exercise of a wary regard on the part of the Calcutta authorities. At length an army of Sikhs, flushed with their triumph over all lawful authority in their own country, crossed the Sutlej, and extended their ravages over British territory; but their advanced guard was met by sir Henry Hardinge, the governor-general, at the head of four regiments of infantry and one of dragoons, and routed at Mudki (q.v.) with heavy loss. Three days after, their main body, which had meantime crossed the river, and intrenched itself at Feroze-Shah (q.v.), was attacked by a larger force of British under Gough and Hardinge, and after a bloody conflict, which lasted two days, also routed. Still undismayed by these reverses, they again intrenched themselves at Sobraon; but a fresh body which had just crossed the Sutlej at Aliwal (q.v.), 19,000 strong, with 68 pieces of cannon, was wholly routed and driven across the river by sir Harry Smith, at the head of 7,000 men, with 32 guns; and their main body was soon after similarly dispersed at Sobraon (q.v.). The British then crossed the river, took Lahore, and restored the authority of the young maharajah, from whom they took the territory between the Beas and the Sutlej, the treaty confirming this settlement being made at Lahore, Mar. 9, 1846. But the internal disturbances in the kingdom of Lahore soon became as active as before, and induced the maharajah's prime-minister to put the country under the company's protection; and a residency with a guard of regular troops was then established in the capital. On April 20, 1848, two British officers were murdered by a Sikh chief, the dewan Moolraj of Multan; and as this was found to be but a premonitory symptom of a general outbreak, a small force of British under lieut. Edwardes, aided by a body of Sikhs, under the rajah of Bhawalpūr, gallantly attacked the army of Moolraj, which, after a desperate conflict of 9 hours, they defeated on June 18, and both sides in the mean time having received re-enforcements, again on July 1. Multan was then laid siege to, but the defection of 5,000 auxiliary Sikhs under Shere Singh (the son of the sirdar Chhuttur Singh, the governor of Hazara, who had been for some time in revolt, and had driven the British from his district) compelled the British to retreat. For some time the British authorities in the Punjab were hampered by a want of military force, and though the maharajah and much of his army still opposed the Sikh rebels, little reliance could be placed upon most of it. Shere Singh now succeeded in raising his army to 40,000, but was defeated by lord Gough at Ramnugger (Nov. 22). The inconsiderate haste of Gough at Chillianwalla (Jan. 13) nearly lost him that great battle, which was saved only by the extreme valor of his soldiers; but amends for this fault was made at Guzerat (q.v.), where the power of Shere Singh and his allies was completely broken. Meanwhile, the fortress of Multan had, after a protracted bombardment, been captured; and the Company, seeing no other mode of protecting their territories from annoyance by these warlike, fanatics, annexed the Punjab, Mar. 29, 1849, thus terminating the existence of the Sikhs as an independent nation.

SI-KIANG', or **WESTERN RIVER**, a river at the southern extremity of China proper. It has lately been ascertained by our surveyors to be navigable for vessels not drawing more than 16 ft. of water for about 100 m. from its mouth. The Si-kiang is remarkable for the purity and clearness of its waters. It is at present chiefly useful in conveying the sugar-cane that grows in its vicinity, as well as rafts of timber from the forests of Kwangse to the markets of Canton.

SIK KIM, a small protected state in the n.e. of India, bounded on the w. by Nepal, and on the s.e. by Bhutan. Area, 1670 sq.m.; pop. 61,766.

SILENÉ, a genus of plants of the natural order *caryophyllaceæ*; with a tubular 5-toothed calyx; 5-notched or bifid petals, which terminate in a narrow claw at the base, spring from the stalk of the germen, and have each an appendage forming a *corona* (q.v.) in the mouth of the corolla; 10 stamens; 3 styles; the capsule 3-celled, 6-toothed, many-seeded. The species are numerous, mostly natives of the temperate parts of the northern hemisphere, annual and perennial plants; nine or ten of them natives of Britain, and others frequent in flower-gardens.—One of the most common British species is the **BLADDER CAMPION** (*S. inflata*), a perennial, which grows in corn-fields and dry pastures, and near the sea-shore, has a branched stem fully a foot high, ovate-lanceolate bluish green leaves, panicles of white flowers, and an inflated calyx, with a beautiful network of veins. The young shoots are sometimes used like asparagus, and have a peculiar but agreeable flavor, somewhat resembling that of peas. They are best when most blanched. The cultivation of this plant was long ago strongly recommended, but it has not obtained a place among garden plants.—The **Moss CAMPION** (*S. acaulis*) is a pretty little plant, with beautiful purple flowers growing in patches so as to form a kind of turf, one of the finest ornaments of the higher mountains of Scotland, and found also in Cumberland and Wales.—Many species, some of them British, are popularly called **CATCHFLY**, from their viscidty, as *S. Anglica*, a species found in sandy and gravelly fields in many parts of Britain.

SILENUS, son of Pan and Gæa (the earth), is generally represented as the chief of the Sileni or older Satyrs (q.v.), and the inseparable companion of Bacchus, with whom he took part in the contest against the Gigantes, slaying Enceladus. In most respects he seems to have resembled the other satyrs, and to have borne a strong likeness to sir J. Falstaff, being in addition noted for his wisdom and his power of prophecy. Silenus had a temple at Elis.

SILE SIA, a province of the kingdom of Prussia, included in the limits of the German empire, lies s. of the provinces of Brandenburg and Posen, and is bounded on the e. by the Polish provinces of Russia and Austria, and on the s. and w. by the Austrian provinces of Silesia and Bohemia, and the kingdom of Saxony. It is divided into three governments: *Liegnitz*, in the w.; *Breslau*, in the e.; and *Oppeln*, in the s.; and these, again, are subdivided into circles. Area, 15,666 English sq.m.; pop. 71, 3,707,141, of whom 1,896,136 were Catholics, 1,760,341 Protestants, and 46,629 Jews; 75, 3,843,699. Of the population, $\frac{1}{5}$ speak Polish, more than 90,000 employ other Slavic dialects, and the rest use the German language. This province, the largest and much the most populous of the Prussian provinces, is crossed from n.e. to s.w. by a broad strip of mountainous country, which widens out at each extremity; and along the whole eastern boundary, and in the s. are ranges of low hills; in the n.w. and center the surface is flat and heathy, or sandy, with numerous stagnant pools. Silesia is almost wholly included in the basin of the Oder (navigable as far s. as Ratibor), which flows through it from s.e. to n.w., and receives from each side numerous tributaries; but a small portion in the extreme s. is drained into the Vistula, which here takes its rise. The soil is altogether fertile and well cultivated, more so, however, in lower than in upper Silesia; and cereals of all kinds, oil-plants, beet, hops, occasionally vines, and, above all, flax and hemp, are the crops of the province; but of late years the cultivation of tobacco and of plants yielding dye-stuffs has been receiving increased attention. Cattle and sheep, the latter excellent in quality, and partly of pure or mixed merino blood, are reared in the highlands, the annual produce of wool averaging fully 140,000 cwt. The mines of Silesia are of great importance; iron, copper, and lead are the chief products; coal is found in abundance. The manufacture of lace, averaging in annual value £1,500,000, is carried on in the mountainous districts, chiefly around Schweidnitz; and the production of other fabrics, as linen, cotton, and woollen goods, paper, iron, leather, glass, and earthenware, is vigorously carried on throughout the province. The Oder and the great central railway from Berlin and Posen to Vienna afford ample facilities for commerce. There are a university at Breslau, gymnasia in the principal towns, and a great number of professional and industrial schools.

Silesia was inhabited at the beginning of the Christian era by the Quadi and Lygii, who, like the other German tribes, advancing westward in the 6th c., were succeeded by Slavic tribes. It formed part of the Slavic kingdom of Moravia, was next joined to Bohemia, and in the beginning of the 10th c. to Poland. In 1163 it was separated from the kingdom of Poland, but was ruled by dukes who were of the royal line of Piast; these dukes, to repopulate the country, which had been devastated by the numerous civil wars, encouraged the settlement of German colonies, especially in lower Silesia. The practice of division and subdivision of territory prevailed so extensively in Silesia that

at one time it had no less than 17 independent dukes, and to save itself from reincorporation with Poland, it acknowledged the sovereignty of the kings of Bohemia, with which, and with Germany, from the time of the emperor Karl IV., it was indissolubly connected. In 1537 the duke of Liegnitz, one of the numerous Silesian princes, entered into an agreement of mutual succession (*erbeerbrüderung*) with the elector of Brandenburg, on the extinction of either reigning line; and the other ducal lines becoming gradually extinct their possessions fell to Liegnitz or to Bohemia, or lapsed to the emperor. In 1675, when the last ducal family, that of Liegnitz, failed, its territories of Liegnitz, Brieg, and Wohlau would have fallen to Prussia; but the emperor of Germany refused to recognize the validity of the agreement of 1537, and took possession of the Liegnitz dominions, as a lapsed fief of Bohemia. The remainder of Silesia was thus incorporated into the Austrian empire. In 1740, Frederick II. of Prussia, taking advantage of the helpless condition of Maria Theresa of Austria, laid claim, on the strength of the agreement of 1537, to certain portions of Silesia; and without declaring war, marched into and took possession of the province, maintaining his hold despite the utmost efforts of Austria in 1740-42, and 1744-45, called the *first* and *second* Silesian wars. After the *third* Silesian war, better known as the seven years' war (q.v.), it was finally ceded (1763) to Prussia.

SILESIA, AUSTRIAN, a duchy and crown-land of the Austrian empire, bounded on the n.e. by Prussia, and on the s.w. by Moravia. Area, 1980 sq.m.; pop. '76, 558,196. It is mountainous in the w., where the Spiegltitzer Schneeberge, a summit of the Sudetic chain, rises to the height of 4,512 feet. The crown-land comprises 1806 sq.m. of level land, of which by far the greater portion is arable or under wood. The climate, though rough, is healthy, and the soil produces good crops of rye, oats, barley, flax, etc. Within the crown-land rise the Oder and Vistula. Cattle-breeding and bee-keeping are important branches of industry; 110,000 head of sheep belong to the crown-land. Iron, lead, and coal mining are profitably pursued. The manufactures are principally spirits, copper and iron wares, and linen and cotton fabrics.

SILEX (Lat. flint), a generic name given by some mineralogists to all those minerals of which silica is the principal ingredient. See QUARTZ.

SILHOUETTE, the name given to a profile or shadow-outline of the human figure, filled in of a dark color, the shadows and extreme depths being sometimes indicated by the heightening effect of gum or some other shining material. This species of design was known among the ancients, and was by them carried to a high degree of perfection, as the monochromes on Etruscan vases amply testify; but the name silhouette is quite modern, dating from about the middle of last century. It was taken from Etienne de Silhouette, the French minister of finance in 1759, who, to replenish the treasury, exhausted by the costly wars with Britain and Prussia, and by excessive prodigalities, inaugurated numerous reforms, and the strictest economy of expenditure. His extreme parsimony in all finance matters made him a choice subject for caricature; so that any mode or fashion that was plain and cheap—"surtouts" without plaits, trousers without pockets—was styled *à la silhouette*; and profiles made by tracing the shadow projected by the light of a candle on a sheet of white paper being then much in vogue, have continued to bear the name. Although without merit as a work of art, the silhouette presents a clear and well-marked profile, and such instruments as the pantograph (q.v.), etc., used to be frequently employed to obtain profiles of a reduced size direct from the human features. Profiles cut out of black paper with scissors also receive the name of silhouettes.

—**SILICA**. See SILICON.

SILICON, or SILICIUM (sym. Si, eq. 14—in new system, 28—spec. grav. 2.49), is one of the non-metallic elements (see CHEMISTRY). It may be obtained in first of these, the three different forms, viz., the *amorphous*, the *graphitoid*, and the *crystalline*. It is the amorphous silicon, which is obtained by the processes in common use, the second and third being obtained from this first modification.

Amorphous silicon presents the appearance of a dull brown powder, which adheres to the finger, is insoluble in water and in nitric and sulphuric acids, but readily soluble in hydrofluoric acid, and in a hot solution of potash. It is a non-conductor of electricity, and when heated in air or oxygen its external surface burns brilliantly, and is converted into silica, which fuses from the extreme heat, and forms a coating over the unburned silicon. *Graphitoid* silicon is obtained by exposing the amorphous variety to an intense heat in a closed platinum crucible. This form of silicon will not take fire when heated in oxygen gas, and resists the solvent action of pure hydrofluoric acid, although it rapidly dissolves in a mixture of nitric and hydrofluoric acids; moreover, as another point of difference, it is a conductor of electricity. For the description of *crystallized* silicon, we may refer to a treatise by Deville (in the *Ann. de Chimie*, 3d ser., vol. 49, p. 65), who obtained it in regular double six-sided pyramids of a dark steel-gray color.

Silicon, in a state of combination with oxygen, is the most abundant solid constituent of our globe; and, in less proportion, is an equally necessary ingredient of the vegetable kingdom, while in the animal kingdom it occurs in mere traces, except in a

few special cases. It is never found in nature except in combination with oxygen; but by a somewhat difficult process—which we need not here describe—it may be separated as a dark brown powder. It was first isolated by Berzelius in 1823. For our knowledge of the other modifications we are indebted to Wöhler and Deville.

Silicon forms two oxides, one of which is only known in the hydrated state, while the other is the well-known compound silica or silicic acid. *Hydrated oxide of silicon* is represented by the formula $2\text{H}_2\text{O}, 3\text{SiO}_2$, and silicic acid by SiO_2 . The hydrated oxide exhibits many interesting chemical properties, but is of no practical importance.

Silicic acid or *silica* exists both in the crystalline and in the amorphous form. The best examples of the crystalline form are rock crystal, quartz, chalcedony, flint, sandstone, and quartzose sand. Silica in this form has a specific gravity of about 2.9, and is only attacked with difficulty by potash or hydrofluoric acid. The amorphous form exists naturally in opal, and is obtained artificially as gelatinous silica, etc.; it differs from the former in its specific gravity, being about 2.2, and in its being rapidly dissolved by potash and by hydrofluoric acid. Pure silica (as it occurs in rock-crystal, for example) is perfectly transparent and colorless, and is sufficiently hard to scratch glass. The heat of the oxyhydrogen blowpipe is required for its fusion, when it melts into a transparent glass, capable of being drawn out into elastic threads. Perfectly pure silica in its amorphous form may be obtained by various chemical processes. If a solution of silicate of potash or soda be treated with hydrochloric acid, the silicic acid separates as a hydrate, and on evaporating this to dryness, and treating it with boiling water, silicic acid remains as an amorphous powder, which, after being washed, dried, and exposed to a red heat, may be regarded as chemically pure. The hydrated silicic acid mentioned in the above experiment is soluble in water and (more freely) in acids and alkalis. The solubility of hydrated silicic acid in water accounts for the presence of silicic acid in mineral springs, and in the Geysers of Iceland, as well as for its gradual separation from these waters in the form of petrifications. That silica or silicic acid is a true acid (although a feeble one) is obvious from its uniting with bases, especially those which are capable of undergoing fusion, and forming true salts, known as silicates. These silicates occur abundantly in nature; all the forms of clay, feldspar, mica, hornblende, augite, serpentine, etc., being compounds of this description. Silicic acid combines with bases in various proportions. The following table, borrowed from Miller's *Elements of Chemistry*, vol. ii., shows the combinations which are of the most usual occurrence:

	Examples.	Formulae.
$2\text{MO}, 3\text{SiO}_2$, or Sesquisilicates.	{ Silicate of lime..... Meerschaum (hydrated silicate of magnesia)	$2\text{CaO}, 3\text{SiO}_2$. $2\text{MgO}, 3\text{SiO}_2 + 2\text{H}_2\text{O}$.
MO, SiO_2 , Neutral silicates.	{ Wollastonite (silicate of lime)..... Diopase (hydrated silicate of copper).....	CaO, SiO_2 . $\text{CuO}, \text{SiO}_2 + \text{H}_2\text{O}$.
$2\text{MO}, \text{SiO}_2$, Dibasic silicates.	{ Olivine..... Iron forge cinder.....	$2\text{Mg}, \text{FeO}, \text{SiO}_2$. $2\text{FeO}, \text{SiO}_2$.
$\text{MO}, 2\text{SiO}_2$, Disilicates.	The composition of many of the ordinary varieties of glass may be approximately represented by mixtures of different silicates which have this formula.	

In the above formulæ MO stands for 1 equivalent of any metallic protoxide, such as lime, magnesia, or protoxide of iron.

The following are the general characters of the silicates: Most of them are fusible, the basic silicates fusing more readily than those which are either neutral or contain an excess of acid. Excepting the silicates of the alkalis no silicates are soluble in water. The anhydrous, neutral, and acid silicates of the earths resist the action of all acids except the hydrofluoric.

In conclusion we may remark that silica derives its name from *silex*, flint, of which it is the essential constituent, and that it is largely employed in the manufacture of glass, china, and porcelain. For these purposes it is obtained in a finely comminuted state by heating flints or portions of colorless quartz to redness, and plunging them in cold water. The silica splits up into a friable mass, which may be easily ground to a fine powder. The use of silica in giving firmness and rigidity to various parts of the animal organs is exemplified in its free occurrence in the quill-part of the feather of birds, in the shields of certain infusoria, and in the spicula occurring in sponges; while its similar use in the vegetable kingdom is seen in its more or less abundant presence in the stalks of the grasses, more particularly in the cereals and in the bamboo (where it is especially deposited about the joints, and is known as *tubusbeer*), in the equisetæ, etc.

Silicon may be made to combine with several other elements besides oxygen, but, with the exception of silicofluoric acid, these compounds are of no practical value. Thus silicon and hydrogen form a hydride of silicon, a colorless and spontaneously inflammable gas. Nitride of silicon is a bluish fibrous body, white sulphide of silicon is a white earthy powder. Silicon unites with chlorine, bromine, and probably iodine and fluorine, in two proportions corresponding to its oxygen compounds. Fluoride of silicon (SiF_2) is a colorless pungent gas, liquefiable under strong pressure, and solidifying at -220° , inflammable, and a non-supporter of combustion. It is obtained by heating powdered glass with 12 times its weight of oil of vitriol, and when a stream of this gas is transmitted through water a reaction takes place; two atoms of water and three atoms of the fluoride of silicon yielding silicofluoric acid (HF, SiF_2), which remains in solution,

and silicon, which is deposited. A saturated solution of this acid forms a very sour fuming liquid, which does not directly attack glass, but if allowed to evaporate on it, causes erosion from the fluoride of silicon becoming evaporized, and free hydrofluoric acid being left. A dilute solution is frequently employed in the laboratory as a precipitant of potash, which it throws down in a transparent gelatinous form. With salts of baryta it gives a white crystalline precipitate. It combines with bases to form salts, none of which are of any special importance.

SILIQUE, *Siliqua*, in botany, the fruit of the *crucifera*, a capsule opening by two valves, which, when ripe, separate from the base upward, leaving a central frame (*replum*), to which the seeds remain attached, and which is regarded as formed by parietal placentas, the valves giving way close to the suture. The seeds are either in one row or two. A **SILICULE** (*silicula*) is merely a silique of a different form, the true silique being long and narrow, the silicule broad and short, although Linnaeus made this difference the foundation of the orders (*siliquosa* and *siliculosa*) of his class *tetradynamia*, a distinction not now equally attended to in the subdivision of the natural order *crucifera*.

SILISTRIA, a t. of the new principality of Bulgaria, is situated on the right bank of the Danube, which is here nearly one-fourth of a mile wide, and is studded with numerous islands. The houses are mean, and built generally of wood, though sometimes of stone; and also of mud; the streets, like those of most Moslem cities, are crooked, narrow, dirty, and ill-paved; and the manufactures are insignificant, though there is a considerable trade in wood and cattle. Pop. 20,000. The Dobrudscha, ceded by Turkey to Rumania in 1878, is bounded by a line running from a point just e. of Silistria to Mangalia on the coast. The importance of Silistria lay formerly in its value as a military outpost of Turkey. Its walls were constructed of solid masonry, but consisted merely of a fortified *enceinte* (q.v.) surrounded by a ditch, the great strength of the fortress depending upon the support given to it by detached works. Silistria is a town of great antiquity, and was a fortress under the Byzantines. Here, in 971, the Byzantine emperor, John Zimisceus, routed the Russians under Sviatoslav. It has been repeatedly assaulted and taken by the Russians. In 1849 Silistria was made a stronghold of the first class, and was rendered almost impregnable by the addition (1853) of 12 detached forts on the s. and east. On the outbreak of the Crimean war the Russians laid siege to it, with an army of from 60,000 to 80,000 men, but were compelled to retreat after 39 days. The congress of Berlin in 1878, when erecting Bulgaria into a principality, decreed that the fortifications of Silistria, like those of the other Bulgarian cities, should be dismantled.

SILK AND SILK-WORM. The name *silk* is derived by the not unusual substitution of *l* for *r*, from Lat. *sericum* (Gr. *serikon*), so called as coming from the country of the Seres or Chinese. The **SILK-WORM** is the caterpillar of the **SILK-WORM MOTHT**, of which there are numerous species belonging to the genus *bombyx* and other genera of the family *bombycidae*, lepidopterous insects of the section popularly known by the name moth (q.v.). The *bombycidae* have a very short and rudimentary proboscis, living for a very short time in their perfect state, and taking little or no food; the body is thick and hairy, the wings are large and broad, either extended horizontally when at rest, or inclined like the sides of a roof; the antennae are pectinated. The caterpillars feed on the leaves and other tender parts of trees or other plants; the chrysalids are inclosed in a cocoon of silk, which gives to some of the species a great economical importance. The most important is the **COMMON SILK-WORM** (*bombyx mori*), a native of the northern provinces of China. The perfect insect is about an inch in length, the female rather larger than the male; the wings meeting like the sides of a roof; the color whitish, with a broad pale brown bar across the upper wings. The females generally die very soon after they have laid their eggs, and the males do not survive much longer. The eggs are numerous, about the size of a pin's head, not attached together, but fastened to the surface on which they are laid by a gummy substance, which, when dry, becomes silky. They are laid in the end of summer, and are hatched in the beginning of next summer. The caterpillar is at first very small, not more than a quarter of an inch in length, but rapidly increases in size, till, when full grown, it is nearly 3 in. long. It is of a yellowish gray color. The head is large. On the upper part of the last joint of the body is a horn-like process. The skin is changed four or five times during the growth of the caterpillar. Before each change of skin, it becomes lethargic, and ceases to eat, whereas at other times it is very voracious. When the skin is ready to be cast off, it bursts at the forepart, and the caterpillar then, by continually writhing its body, without moving from the spot, thrusts it backward; but silk-worms frequently die during the change of skin. A very rapid increase of size takes place while the new skin is still soft. The natural food of the silk-worm is the leaves of the white mulberry, but it will also feed on the leaves of some other plants, as the black mulberry and the lettuce. When so fed, however, it produces silk of inferior quality. The silk-producing organs are two large glands (*sericteria*) containing a viscid substance, which extend along a great part of the body, and terminate in two *spinnerets* in the mouth. These glands become very large when the change to the chrysalis or pupa state is about to take place. When about to spin its cocoon, the silk-worm ceases to eat, and first produces the loose rough fiber which forms

the outer part of the cocoon, and then the more closely disposed and valuable fiber of its interior. In this process, the position of the hinder part of the body is little changed, but the head is moved from one point to another; and the cocoon when finished is much shorter than the body, which, however, being bent, is completely inclosed in it. The cocoon is about the size of a pigeon's egg. Each fiber of silk, when examined by a microscope, is seen to be double, being equally derived from the two silk-producing organs of the caterpillar. A single fiber often exceeds 1100 ft. in length. The time of the silk-worm's life in the caterpillar state is generally about eight weeks. About five days are occupied in the spinning of the cocoon; after which about two or three weeks elapse before the cocoon bursts and the perfect insect comes forth. The natural bursting of the cocoon is, however, injurious to the silk, and the silk-worm rearer prevents it by throwing all the cocoons into boiling water, except those which he intends to keep in order to the maintenance and increase of his stock. These he selects with care, so that he may have about an equal number of male and female insects, the females being known, even in the chrysalis state, by their larger size. The cocoons intended for the production of moths are placed on a cloth in a somewhat darkened room, of which the temperature is near, but does not exceed, 72° Fahr.; and the moths, when produced, show no inclination to fly away, but remain on the cloth, lay their eggs, and die there. It is an interesting peculiarity of this valuable species of moth, that neither in the caterpillar nor in the winged state does it show that restless disposition which belongs to many others, the caterpillars remaining contentedly in the trays or boxes in which they are placed, feeding on the leaves with which they are there supplied, and at last only seeking a proper place to assume the chrysalis form on small bundles of twigs which are placed for that purpose above the trays; the perfect moths, in like manner, abiding almost in one spot, and scarcely caring to use their wings. Owing to this peculiarity it is capable of being reared and managed in a way which would otherwise be impossible.

The silk-worm is liable to various diseases, particularly to one by which great numbers are often destroyed, and which is either caused or characterized by the growth of a small fungus known as *silk-worm-rot*, or *muscardine* (q.v.).

Of the other species of silk-worm, many are rapidly increasing in commercial importance. The following is an enumeration of the chief silk-producing insects; those in italics are not as yet employed in manufactures:

Bombyx mori.—The common silk-worm, native of India, and reared in other parts of the world.

B. cressi.—Crosses have been obtained between this and *B. mori*, yielding excellent silk, at Mussooree.

B. textor.—Native of Mussooree.

B. sinensis.—China.

B. huttoni.—Silk collected in Mussooree.

B. Horgfeldti.—Native of Java.

Attacus atlas.—Native of India, and said to yield some of the "Tusseh silk."

A. Guerinii.—Native of Bengal.

A. ricini.—Native of Assam.

A. cynthia.—The "Eria," or "Arrindy" silk-worm, native of India, now extensively raised in Hong-kong, Nepal, Mussooree, Java, and to some extent in southern Europe. It feeds on the leaves of the ailanto (q.v.) tree.

Antheraea Mezankooria.—The Mezankooria silk-moth.

A. Paphia.—The true tusseh or tussur moth, native of Darjeeling, and other parts of upper India. It is produced very extensively, and is chiefly collected in the jungle districts by the Sahars and other half-wild castes who live in the jungles. The cocoons are so carefully concealed in the leaves that much care is required to discover them, the only indication being the dung of the caterpillar under the trees. The tusseh silk is easily wound off from the cocoons in the same way as that of the common silk-worm.

A. Assama.—The Moonga, or Moogha, native of Assam.

A. Pernyi.—North China.

A. Perrottetti.—North China.

A. Roylei.—Mussooree.

A. Helferi.—Darjeeling.

A. Jana.—Java.

A. Frithii.—Darjeeling.

A. Larissa.—Java.

The preceding seven are all called tusseh moths.

Actias Selene.—Darjeeling.

Saturnia pyretorum.—China.

S. Grotei.—Darjeeling.

Lapa Kutinka.—Java.

Nooris Huttoni.—Mussooree.

Caligula Tibeta.—Mussooree.

C. Sindia.

Salassa Lola.—South-east Himalaya.

Cricula triferrestrata.—Java.

It will be seen by the above list that hitherto very few of the silk-moths have been turned to man's profit. The first in importance after the common silk-worm is the true *tusseh*, next the *moonga*, the silk from both of which can be wound off the cocoon; and then the *eria*, which cannot be wound easily, and is therefore generally carded.

Silk appears not to have been well known to the ancients; although several times mentioned in the translations of the Bible, the best authorities deny that it is in the original, or that it was known to the Hebrews. Among the Greeks, Aristotle is the first who mentions it, and he only says that "Pamphile, daughter of Plates, is reported to have first woven it in Cos;" and from all the evidence which has been collected, it would appear that the natives of Cos received it indirectly (through the Phenicians and Persians) from China. The silken webs of Cos found their way to Rome, but it was very long before they were obtainable except by the most wealthy. The cultivation in Europe of the worm itself did not take place until 530 A.D., when, according to an account given by Procopius, the eggs were brought from India (China) to the emperor Justinian by some monks.

In China the cultivation of silk is of the highest antiquity, and according to the greatest Chinese authorities, it was first begun by Si-ling, the wife of the emperor Hoang-ti, 2,600 years B.C., and the mulberry was cultivated for the purpose of feeding them only 40 years later.

Since its introduction into Europe it has always formed a great branch of industry in Italy, Turkey, and Greece, and it has been cultivated to some extent in France, Spain, and Portugal. In England, too, from time to time, laudable efforts have been made to cultivate it, especially by Mrs. Whitby of Newlands, Mr. Mason of Yately in Hampshire, and lady Dorothy Neville of Dangstein in Hampshire; but their partial success has not encouraged others to pursue this branch of industry, which requires a warmer and less variable climate and cheaper labor than we can command.

The quantity of silk raised in the world is enormous. Great Britain imports annually in the unmanufactured state: "Raw" silk, about 6,500,000 lbs.; "waste," or knubs and husks, about 3,500,000 lbs.; besides undyed "singles," about 5,700 lbs.; tram, about 7,000 lbs.; orgazine, about 39,000 lbs.; and dyed singles and tram, about 3,000 lbs. orgazine, about 10,000 lbs. Singles, tram, and orgazine are terms applied to the thread after it has undergone certain operations (to be afterward described). The total quantity is thus about 10,000,000 lbs., of the value of £5,000,000; and in addition to this we import manufactured silk goods to the value of about £12,500,000; so that the importance of this little insect to Great Britain alone is represented annually by about £17,500,000. It requires 1600 worms to raise a pound of silk.

Rearing of Silk-worms.—It is of the first consequence in the production of silk that one of the species of mulberry should be cultivated, and that it should be so favorably situated as to climate that its foliage is in readiness for feeding the young worms when they are first hatched from the eggs. The species best adapted is the white mulberry, *morus alba*. The extreme lateness of season at which the black mulberry produces its leaves prevents its employment generally, besides which it will not bear the loss of its leaves so well. It is said that in some parts of China the silk-worm is easily reared upon the trees in the open air. So little has it a tendency to wander far from the place of its birth, if food be at hand, that it only requires a warm, dry atmosphere to bring it to perfection; but usually, even in China, and in all other countries, it is thought desirable to raise the silk-worm in properly arranged buildings, and to supply it with mulberry leaves gathered from day to day. In India, China, and other tropical countries, the eggs hatch readily at the proper time by the natural heat; but in southern Europe artificial heat is almost always required; formerly the heat of fermenting dung was found serviceable, and the warmth of the human body was also used, the eggs being carried in little bags in the bosom of the cultivators; but now they are regularly hatched by stove-heat, beginning with a temperature of 64° Fahr., which is gradually increased through ten days to 82°, at which it is maintained until the eggs are hatched. Experience has shown that the operation is facilitated by washing the eggs in the first place with clean water; and some cultivators also wash them in wine, the value of which is very questionable. Washing is found to remove a certain gumminess and other impurities from the eggs, which would otherwise impede the hatching. When the silk-worms have been regularly developed as above described, it is usual to place above the trays various little contrivances for the caterpillar to spin within; many of the Italian growers employ an ingeniously simple arrangement, which lasts many seasons, and when not in use occupies very small space. It consists of a number of thin slips of wood, about an inch and a half broad, and all cut sufficiently long to reach across the trays. They are each cut at intervals of an inch half through, so that one will fit into another, and when complete they all form a series of cells, which, set in a tray, form the very best receptacles for the silk-worm to spin in. When not in use, the whole arrangement can be compressed into very small compass for convenience of storage. Others use little cones of paper, or small twigs, among which the cocoons are spun.

In feeding the worms, care is taken so to distribute the food on the shelves or in the trays that the insects shall not crowd together; and for this reason the most careful cultivators chop the leaves small, and strew them very evenly about. Great care is taken not to let the worms of one hatch mix with those of another, unless of exactly the

same age, otherwise the stronger insects would deprive the younger of their food. Many other niceties of attention are required, which altogether render the successful rearing of silk-worms a matter of much anxiety and labor.

Preparation of Silk.—When the cocoons are completed, which is known by the absence of any sound within, they are carefully sorted, and a certain number are kept for laying. The sexes are readily known by the difference of shape as well as of size, the female being plumper, and the male, besides being much smaller, having a central depression and sharper extremities. The French growers sort them into nine varieties, those which are less compact, or in which the worm has died—a fact known by external indications—being separated from the good ones. When the sorting is finished, the cocoons are placed in an oven with a gentle heat, which kills the inclosed chrysalis, otherwise they would all become *perforated* by the insect eating through; they are then prepared for winding by first removing the flossy covering, which is often somewhat hard and compact. The cocoons are placed in basins of water, kept warm by charcoal fires, or, in the larger establishments, by steam. This softens and dissolves the natural gum which coats the silk, and makes the various coils of silk adhere together in the cocoon. The operator then takes a small branchy twig, and stirs them about in the water. This is sure to catch hold of any liberated ends which may be floating in the water. From three to five of these ends are taken and twisted together with the fingers, so as to unite them into one thread, which is passed through a polished metal or glass eye in the reeling-machine, which is so far from the hot-water basin as to give the softened gum on the silk time to dry in its passage from the basin to the reel. In large *filatures* or silk establishments, complex machinery is used for winding; but reeling apparatus of the greatest simplicity is used by the Chinese, East Indians, and others with almost equal effect, when carefully done, except in the amount of work accomplished. In all cases, however, the principle is the same, and is very simple. Great care and skill are required in reeling silk from the cocoons, because, although the reeler starts with four or five cocoons, not only are their individual threads apt to break, but they are not all of the same length, so that one will run out before the others. These matters are carefully watched; and as often as a thread breaks, or a cocoon runs out, another thread is joined on, and is made to adhere to the compound thread on the reel by its natural gumminess. Each cocoon generally yields 300 yards of thread, so that it takes 1200 or 1500 yards to make 300 yards of the filament of raw silk, by which name the reeled silk is always known. The raw silk is made up into hanks of various sizes. That from China and Japan is tied in packages of six hanks each, technically called *books*, and sometimes the ends of these books are covered with silken caps very curiously formed out of a single cocoon, so managed as to form a filmy cap sufficiently large to cover a man's head. The method used by the Chinese to accomplish this is quite unknown in Europe. These caps or bags, when closed, are sometimes nearly a foot square, and much of the wadding used by the Chinese dressmakers for padding is made by placing these bags upon each other to the required thickness.

Notwithstanding the care taken in reeling the silk from the cocoons, and forming several threads into one, it is not ready for the weaver, but has to undergo the processes called collectively *throwing*. In this country, this is a special trade, the *silk throwster* usually conducting it in large mills with extensive machinery, where the above processes are all carried on, generally by steam-power. The silk reaches the throwster in hanks as imported. These are put into clean soap and water, and carefully washed, ties having been placed at intervals, to prevent the silk entangling. After being dried by hanging in the drying-room, they are placed on large skeleton reels called *swifts*, so adjusted that they will hold the hanks tightly. In a *swift*, the spokes are in pairs. They are made of thin pieces of lancewood, and each pair are rather nearer together at the axle than at the circumference, where they are connected together by a small band of cord. These bands are so tied that they will slip down easily to admit of the hanks being placed; then, by pushing the cords upward, the hank can be stretched to its fullest extent. This is necessary to compensate for the varying lengths of the hanks received from different countries.

When the *swifts* are set in motion, the silk is carried from the hanks to bobbins, upon which it is wound for the convenience of further operations. The bobbins are then taken from the *winding* to the *cleaning* machine, when they are placed on fixed spindles, so that they will turn with the slightest pull; and the thread is passed through a small apparatus attached to the machine, which is specially called the cleaner, and consists essentially of two polished smooth-edged blades of metal, attached to a part of the frame of the machine. They are held together by a screw, and are slightly opened or closed by another screw, so that the thread can be put between them down to a small orifice, and then, by tightening the screw, preventing its return, after passing through this small hole, which is the gauge of the thread, and which removes any irregularities or adherent dirt. The silk next passes over a glass or metal rod, and then through another small hole, much larger than that of the *cleaner*, and usually made of glass, on to the bobbin, upon which it is wound by the action of the machine. The next process is *tristing* the cleaned thread, by which it becomes better adapted for being combined with other threads. *Doubling* is the next process, and this consists in running off a number of bobbins of *tristed* silk on to one bobbin of a larger size, which is put into the *throwing*-machine, when the ends of the *doubled* silk are passed through a smooth hole on to a

large reel, which rewinds it into hanks, but twisting the threads into a fine cord as it goes from the bobbins to the reel. This operation of *throwing* derives its name from the Saxon *throwan*, to whirl or twist. After this the hanks have to be again wound on-reels and bobbins for the weaver, the former for the warp, and the latter for the weft. For many purposes, only some of these operations are required. Thus for common and light fabrics, such as *Persian gauze*, etc., only the two first are needed—viz., the *winding* and *cleaning*, and the material is called *dumb-singles*. If it has been *wound, cleaned, and thrown*, it is called *thrown-singles*, and is used for weaving common broad stuffs, or plain silks and ribbons. If *wound, cleaned, doubled, and thrown*, it is called *tram*, and is used for the richest silks and velvets, but only for the weft or shoot; and if *wound, cleaned, spun, doubled, and thrown*, it is called *organzine*, and is used for the warps of fine fabrics.

Before winding the cocoons, a flossy portion has to be removed; and after all has been wound off, another portion remains, like a compact bag; these are collected and sold under the name of *waste-silk*, and to these are added the fragments of broken threads, which accumulate in considerable quantities during the reeling and throwing operations. Formerly, very little use was made of waste-silk; not a little of it was employed by engineers and others for mere cleaning purposes; although as early as 1671, a proposition was made by a manufacturer named Edmond Blood to make it available by carding it with teasels or rowing-cards. He took out a patent for this invention, but apparently did not bring it into use. Another patent was taken out by Mr. Lister of Bradford, which has done wonders; now the waste is all spun into yarn, thereby greatly economizing the use of silk, as the quantity of silk-waste always greatly exceeds the amount of good silk reeled off. The processes employed in the production of silk-yarn from the waste differ little from those for spinning other materials. See SPINNING.

The silk manufactures of Britain are chiefly located in Spitalfields, London, at Macclesfield and Congleton in Cheshire, at Derby, and in Glasgow. The dyeing of silk is done chiefly in the neighborhood of London, at Nottingham, and at Manchester; and considerable quantities of silk goods are sent from India to be printed with patterns in London and other parts of England. These goods are chiefly the corah and bandana pocket-handkerchiefs, and Indian waist and turban scarfs.

SILK (SILK AND SILK-WORM, *ante*). There would certainly appear to have been no lack of encouragement of the silk industry in the early days of American colonial history. James I. was enthusiastic on this subject (see MANUFACTURES), and the colonists themselves devoted much time and labor to the growth of the mulberry tree, and the culture of silk-worms. In 1732 the colonial government of Georgia, allotted a piece of ground for use as a nursery plantation for white mulberry trees. Lands were granted to settlers on condition that they planted 100 of these trees on every 10 acres when cleared, 10 years being allowed for their cultivation. In 1749 the British parliament passed an act exempting from duty all raw silk which was certified to be the production of Georgia or Carolina. In the same year an Italian expert was sent to Georgia to establish a filature—for reeling, doubling, cleaning, and twisting, or throwing, silk—and in 1759 the export of raw silk to England from Georgia alone exceeded 10,000 pounds, and the quality of it was so good that it sold in London at from two to three shillings a pound more than that from any other part of the world. After 1759, however, the production of silk in Georgia fell off greatly, though a French settlement at New Bordeaux, on the Savannah river, manufactured considerable quantities of sewing-silk during the revolution. Mansfield, Conn., became, in the latter part of the 18th c. an important silk-raising section; and this continued to be a fixed industry in that locality, though but little was done in it elsewhere in New England. Pennsylvania engaged in the culture about 1767, and a filature was established in Philadelphia in 1769 or '70, and in 1771 2,300 pounds of cocoons were brought there to reel. This state maintained some prominence in the industry up to the time of the revolution, but it then died out and was not notably revived. From the period of the close of the revolution up to about 1825 the silk manufacture in the United States was purely domestic, families making small quantities—hardly ever reaching 100 pounds per annum in a single family. The importation of silk goods in the mean time had increased enormously, so that in 1821 it amounted to \$4,486,924. It was felt that this costly importation should be stayed, if possible, and several congressional committees investigated the subject, and voluminous reports were made upon it. This brought about the enthusiastic culture of the *morus multicaulis*, which grew into a mania (see MANUFACTURES), during whose existence hundreds of speculators and thousands of private buyers were ruined. The result of this speculative incident, the financial depression of 1837, and the fact that in 1844 a blight affected all the mulberry trees in the country—all these causes combined were disastrous to silk culture in the United States, and the effort to rear silk-worms ceased, not to be revived again, except in California; where, since 1860, the business has been successfully prosecuted. The first silk-mill erected on the western continent was set up at Mansfield, Conn., in 1810. The manufacture was introduced into Philadelphia about 1815; and as early as 1824 the Jacquard loom began to be used there. Power-looms were next introduced, and power-loom weaving was begun about 1838, simultaneously with its adoption in Switzerland. In 1829 there was a manufactory for silk ribbons from

American silks started in Baltimore, but it was short-lived. The business progressed at Mansfield, which soon became a silk-manufacturing center. From 1831 to '39, a large number of factories were started at Windsor Locks, Conn.; Poughkeepsie, N. Y.; in Philadelphia, and elsewhere, the most of which failed. Burlington, N. J., became an important silk-producing locality, beginning about 1838; and included the culture of the mulberry tree and growth of silk-worms, as well as the manufacture of silk. Hartford and Manchester, Conn., Holyoke and Northampton, Mass., and Haydenville, the scene of the Mill river disaster in 1874 (bursting of a reservoir containing 6,000,000 tons of water), are among the New England towns in which silk has been manufactured extensively. But the most important center of this industry in America is Paterson, N. J. (q. v.), where the water-power of the Passaic river, facilities for transportation, etc., seemed to offer the best possible conditions for its prosecution. The first silk-mill in Paterson was set up about 1838, in the fourth floor of Samuel Colt's pistol factory. This was followed by the establishment of other factories; until, in 1875, the business had grown to be an enormous and constantly progressing industry. In that year there were engaged in the silk manufacture in Paterson 32 firms and corporations, with 5 dye-houses; a force of 8,000 operatives, two-thirds of whom were females; 74,323 throwing-spindles; 730 power-looms; 563 hand-looms; and 23,445 braiding-spindles. The amount of capital invested in mills, machinery, and manufacturing was \$5,926,804; the amount of wages paid during the year, \$2,664,993; the number of pounds of silk dyed, 550,000.—The importation of raw silk to supply American manufacturers was as follows in the * years named:—

1870	583,589 lbs.
1871.....	1,100,281 "
1872.....	1,063,809 "
1873.....	1,159,420 "
1874.....	794,837 "
1875.....	1,101,681 "
1876.....	1,354,991 "
1877.....	1,186,170 "
1878.....	1,182,750 "
1879.....	1,889,776 "

A general view of the silk industry in America for the year 1875 shows the following statistics:

No. of firms and manufacturing corporations	213
No. of operatives employed, males.....	4,743
No. of " " females.....	8,739
Capital invested.....	\$17,913,858
Wages paid	\$ 6,392,256
Total value of production....	\$27,158,071
Machinery: Horse-power	2,221
Throwing-spindles.....	192,203
Power-looms.....	2,688
Hand-looms.....	1,814
Braiding-spindles.....	45,618
Chenille spindles	196
Cord-spinning wheels.....	322
Lace machines.....	50

SILK-COTTON. Under this name, various silky fibers are from time to time brought from tropical countries in Europe; they are all of the same general character, and are produced by the trees composing the genus *bombax* and other genera recently separated from *bombax*, of the natural order *sterculiaceae*, known as silk-cotton trees. These trees are natives of the tropical parts of Asia, Africa, and America. The fiber fills their large woody capsules, enveloping the seeds, and is produced in great abundance, but is too short, too smooth, and too elastic to be spun by the machinery used for cotton; although attempts have been successfully made on a small scale in India to spin and weave it; and that of *bombax villosum*, which is of a beautiful purple color, is woven into cloth and made into articles of dress in new Spain. Silk-cotton is much used for stuffing pillows, mattresses, and sofas. Sir James Emerson Tennent says it "makes the most luxurious stuffing" for them. It has the fault, however, of being easily broken and reduced to powder, but might probably be very useful in the manufacture of gun cotton and collodion. The silk-cotton of the East Indies is imported into Britain under the name of *mor-main*,—*bombax ceiba*, the common silk-cotton tree of the West Indies and South America, attains a very great size, its trunk sometimes being so thick that it could not be encompassed by the outstretched arms of sixteen men, and canoes are hollowed out of it of an average burden of 25 tons. The wood is soft and spongy, but is used for many purposes, and when cut into planks, and saturated with lime-water, it bears exposure to the weather for many years.—*Bombax malabaricum*, or *salmalia malabarica*,

is the common silk-cotton tree of the East Indies. It is a tall tree, covered with formidable thorns. Although it is a tropical tree, its leaves fall annually; and just before the fresh leaves appear, it is covered with crimson tulip-like flowers, so abundant that, "when they fall, the ground for many rods on all sides is a carpet of scarlet."

The fiber of the capsules of *chorisia speciosa* and *C. Picholiana*, trees nearly allied to the genus *bombax*, and natives of Brazil, is known as VEGETABLE SILK. It has a beautiful satiny luster, and is very light, but no mode of spinning and weaving it has yet been invented.

SILK SPIDER, *Nephila plumipes* (Koch), a species of spider discovered by prof. Burt G. Wilder on the sea islands of South Carolina in 1865. It produces two kinds of silk, yellow and white, having a continuous length of nearly two miles.

SILK-WEED, or MILK-WEED. See ASCLEPIADACEÆ; ASCLEPIAS; *ante*.

SILK-WORM GUT, a material used by anglers for dressing the hook-end of the fishing-line. It is prepared from the silk-worm at the period when it is just about to spin, and the sericteria or silk vessels are distended with the secretion. The worms are immersed for 12 or 14 hours in strong vinegar, and then taken separately, and pulled in two very gently. The skilled operator knows at sight if the soaking in vinegar has been sufficient, and if so, he lays hold of one end of the viscid secretion, which is seen in the silk glands, and attaches it to the edge of a board; the other end he stretches to the other edge of the board, and attaches it with a pin. When a number are drawn across the board, it is set in the sun for the threads to dry, when they are tied into bundles for use. They are chiefly produced in Italy and Spain.

SILL, the horizontal wood or stone base along the bottom of a window or door; also the wooden plate along the bottom of a partition.

SILLIMAN, BENJAMIN, American physicist, was b. at North Strafford (now Trumbull), Conn., United States, Aug. 8, 1779. His father was a distinguished lawyer, and a brig. gen. in the war of independence. He was educated at Yale college, New Haven, in which he was appointed a tutor in 1799, and was admitted to the bar in 1802, but soon after received from the college the appointment of professor of chemistry; which he accepted only on condition of visiting some of the seats of learning in Europe, to observe the progress of the science. His tour in Europe, 1805-6, was one of the first of which an account was published in the United States. Uniting mineralogy and geology to chemistry, he made a geological survey of Connecticut, observed the fall of a meteorite; constructed, with the aid of prof. Hare, a compound blow-pipe, and repeated the experiments of sir Humphry Davy. In 1822 he first established the fact of the transfer of particles of carbon from the positive to the negative electrode of the voltaic apparatus. In 1818 he founded the *American Journal of Sciences and Arts*, better known as *Silliman's Journal*, of which he was for 20 years the sole, and for 8 more the principal editor. Besides his labors as professor and editor, he began in America the since widely extended work of popular scientific education, by giving public lectures on his favorite sciences in all the chief cities. In 1830 he published a text-book on chemistry, and soon afterward edited an edition of *Baker's Geology*. An account of his last visit to Europe was published in 1851, and reached 6 editions. His last course of lectures was given in 1855, when his son, BENJAMIN SILLIMAN, JR., who had been his associate, became his successor. He died in Nov., 1864.

SILLIMAN, BENJAMIN, JR., b. Conn., 1816; graduated at Yale college, 1837, where he was an instructor in chemistry, mineralogy, and geology, 1838-46; professor of applied chemistry, 1846; one of the beginners of the Yale scientific school, 1847; professor of medical chemistry and toxicology, university of Louisville, Ky., 1849-54; and of chemistry, as successor to his father, at Yale college from 1854 to the present time; state chemist of Connecticut, 1869; associate editor of *Silliman's Journal of Science*, 1838; and associate proprietor, 1846; a director of the departments of chemistry, mineralogy, and geology in the world's fair at New York, 1853; for many years secretary of the American association for the advancement of science; has published *First Principles of Chemistry*; *Principles of Physics*; many papers on scientific subjects; and has been a popular lecturer on science.

SILLOTH, a t. and watering-place of England, of quite recent origin, in the county of Cumberland, at the terminus of a branch of the North British railway, 20 m. w.n.w. of Carlisle, is picturesquely situated on the Solway. The port is of growing importance, and possesses a good stone dock, with an area of five acres, having a fine jetty, 1000 feet long, projecting into the sea. Silloth is much resorted to for sea-bathing, the climate being mild and salubrious, and considered highly favorable for those affected with pulmonary complaints. The mean annual temperature is 49°, being the same as that of Worthing (q.v.) on the s. coast of England, and only 1° below that of Torquay. According to the registrar-general's returns, the mean average death-rate in Silloth for 10 years is only 10.2 per 1000. Silloth is of easy access from all parts of England by railway, and steamers ply at stated intervals to and from Liverpool, Dublin, Belfast, and the Isle of Man.

SILLOWAY, THOMAS WILLIAM, b. Newburyport, Mass., 1828; ordained minister of the Universalist faith, 1862; became a designer of plans for public buildings in Boston,

1851. He has built and reconstructed several hundred churches and public buildings in different parts of the United States. He has edited books on architecture, ventilation, etc., and published *Text-Book of Modern Carpentry*.

SILLO. See ENSILAGE.

SILLOAM, or SHILOAH, is spoken of three times in Scripture: Isaiah says, "the waters of Shiloah that go softly;" Nehemiah calls it "the pool of Siloah;" and John, "the pool of Siloam." Josephus says it was at the mouth of the Tyropeon, where a fountain is still found. Jerome mentions its intermittent flow, which is still observed. The water descends from the fountain of the Virgin through a long subterranean passage into a basin under the cliff, and thence into a larger reservoir. That this passage connects the fountain and the pool, Dr. Robinson proved by crawling through it from one end to the other, a distance of 1750 feet. He witnessed also the intermittent flow in the fountain, as well as the pool.

SILPHIUM, a genus of plants belonging to the order *compositæ*. Generic characteristics: heads many-flowered, radiate; rays numerous, pistillate and fertile; ovaries in two or three rows; disk flowers apparently perfect, but with undivided style and sterile; scales of the broad and flattish involucre imbricated in several rows, broad, and with loose, leaf-like summits, except the innermost, which are small. They are tall, coarse, perennial herbs, having a copious resinous juice, and large corymbose-panicled yellow flowering heads. *Silphium laciniatum*, called rosin-weed and compass-plant, is rough and bristly, growing from 3 to 6 ft. high; leaves pinnately parted, with divisions lanceolate or linear, rarely entire; scales of the involucre ovate, tapering into long and spreading rigid points; achenia, or one-seeded capsule, broadly winged and deeply notched. It grows on the prairies of Michigan, Wisconsin, and southward and westward: blossoms in July. It is called compass-weed from its reputed property of growing so as to point its leaves to the cardinal points of the compass. Another species, *S. terebinthinaceum*, the prairie burdock, grows from 4 to 10 ft. high, with many small heads in a panicle at the top; leaves ovate-cordate, serrate toothed, thick, rough, more so beneath, and from 1 to 2 ft. long on slender leaf-stalks. A variety, *pinnatifidum*, has deeply cut, or pinnatifid leaves. It grows on prairies and oak openings, Ohio, Michigan, Wisconsin, and southward: blooms in July and September. Other species are *S. trifoliatum*, *S. asteriscus*, *S. integrifolium*, and *S. perfoliatum*, the cup-plant, which grows from 4 to 8 ft. high, having ovate leaves, coarsely toothed, the upper united by their bases, forming a cup-shaped disk; heads corymbose, and achenia winged and variously notched; grows on rich soils along streams in Michigan, Wisconsin, and southward. Also escaped from gardens eastward: blossoms in July.

SILURIAN ROCKS, a large division of the paleozoic rocks, between the old red sandstone and the Cambrian strata. They comprise the greater portion of the rocks called by Werner "transition," because, as he thought, in their structure they exhibited an intermediate character between Lehman's "primary" or metamorphic rocks, and the "secondary" or fossiliferous deposits. But the fossils peculiar to these beds having been found in rocks without the transition structure, the name has long ago fallen into disuse. The term "grauwacke" or "graywacke," a miners' term, was also introduced from the Germans, and for some time employed to designate these rocks, because of the abundance in them of a compact argillaceous sandstone; but this awkward name has also given place to Silurian, a term introduced by sir R. I. Murchison when he first established the system, and derived from the district where he investigated the strata, which was the region of the Silures, a tribe of ancient Britons.

The Silurian system contains an enormous thickness of rocks, nearly 30,000 ft., according to some estimates, the absolute thickness being greatly increased by immense beds of interstratified igneous rocks. The upper limit, underlying the old red sandstone, is universally accepted, but there has been considerable diversity of opinion in regard to the inferior boundary. Prof. Sedgwick, having described the rocks of N. Wales, which at first were considered to be older than the series which Murchison had illustrated, designated them Cambrian. This name has been retained for the immense mass of indurated shales and sandstones of a thickness nearly equal to that of the Silurians, which contain only faint traces of organic life, and underlie the Llandeilo formation. But Sedgwick claims also the lower Silurian rocks as a portion of his system; the priority of name, and the uniform facies of the organic remains of the whole of the Silurian rocks, have, however, induced geologists to consider the limits as originally given by Murchison as those of the system.

The subdivisions of the rocks of the period are the following:

	Thickness in Feet.
<i>Upper Ludlow—</i>	
1. Downton Sandstone and Tilestones.	80 to 1000
2. Upper Ludlow Shale.	800
<i>Lower Ludlow—</i>	
3. Aymestry Limestone.	150
4. Lower Ludlow Shale	900

	Thickness in Feet.
<i>Upper Wenlock—</i>	
5. Wenlock Limestone.....	300
<i>Lower Wenlock—</i>	
6. Wenlock Shale.....	1400
7. Woolhope Limestone and Denbighshire Grit.....	150
MIDDLE SILURIAN ROCKS.	
<i>Upper Llandovery—</i>	
8. Tarannon Shale.....	1000
9. May-hill Sandstone and Pentamerous Limestone.....	800
<i>Lower Llandovery—</i>	
10. Llandovery Slates.....	1000
LOWER SILURIAN ROCKS.	
<i>Caradoc—</i>	
11. Caradoc Sandstone.....	} 12,000
12. Bala Limestone.....	
<i>Llandeilo—</i>	
13. Upper Llandeilo.....	} 1500
14. Lower Llandeilo or Arenig Beds.....	
Contemporaneous Volcanic Rocks.....	5800

The typical Silurian strata are in Wales, and the adjoining English county, Shropshire. With the exception of the southern and south-eastern districts, where the old red sandstone and coal measures occur, the whole of Wales is composed of Silurian and Cambrian rocks. The same deposits are found in Cumberland and the n. of Lancashire. The whole of Scotland, s. of a line drawn from Dunbar on the e. to Girvan on the w., consists of graywacke rocks, slates, and limestones of Silurian age, with the exception of one or two small patches of old red, carboniferous, and permian strata. The rocks, till recently referred to an azoic group, below the lowest fossiliferous strata in the n. of Scotland, are now generally believed to be highly altered beds of this period. The southern boundary of these beds is a line drawn from Stonehaven to Helensburgh. A huge trough, filled up with old red sandstone and carboniferous strata, separates the highly altered strata of the north from the less altered deposits of the south. An extensive region of Silurian rocks occurs in the south-eastern counties of Ireland and in Galway; and a great track of the same beds extends from the center of Ireland (Cavan, etc.) to the coast of Down. The metamorphic rocks of the north-west are most probably also of the same age as the corresponding strata in the n. of Scotland.

On the continent Silurian strata have been examined and correlated with the British types, in Bohemia, by M. Barrande; in Scandinavia by M. Angelin; and in Russia by Murchison and others. In North America, also, extensive regions are covered with these strata. They have been wrought out and their fossils described by the Canadian and United States surveyors. Similar strata have also been detected in India, Australia, and South America.

The life of the period presents a group of very characteristic organisms, which, with the exception of the fish-remains found in the upper beds, all belong to the invertebrata. Many of them are confined to the Silurian rocks, or occur only very rarely in some of the palæozoic formations. The graptolites are a strictly Silurian family of zoophytes, and most of the forms of trilobites are found only in this period, though some members of the tribe are found in rocks of Devonian and carboniferous age. Besides these may also be specified such forms as heliolites and favosites among the corals; actinocrinites and the cystidians among the echinoderms; orthids and lingula among the brachiopods; and lituites and maclurea among the cephalopods.

In all the immense thickness of Silurian rocks no deposit has been discovered containing organisms that have lived on land. Some fragments have been noticed that have a faint resemblance to the branches of lepidodendron, and minute bodies occur in the bone-bed, which are referred to the spores of a terrestrial cryptogam. The only other indications of plants are impressions believed to have been produced by sea-weeds. The anthracitic shales of Wales and Scotland probably derived their anthracite from the algae that must have abounded in the Silurian seas. In Shropshire a number of shells have been found, whose nearest allies are littoral species, and these appear to indicate the existence there of an ancient shore. The Silurian rocks are, however, generally sea deposits, and Forbes has ingeniously shown, from the small size of the conchiferæ, the paucity of spiral univalves, the great number of floating shells and of the pelagic orithidæ, and the great rarity, or absence except in the upper beds, of fossil fish, that it is most probable they were deposited, in a sea more than 70 fathoms deep.

SILURIAN ROCKS (*ante*). The lower Silurian in North America embrace, I. the primordial, or Cambrian period, which again embraces the Acadian and the Potsdam epochs. II. Canadian period, which embraces the calciferous, the Quebec, and the Chazy epochs. III. Trenton period, embracing the Trenton, Utica, and Hudson river epochs. The upper Silurian embraces, 1. the Niagara period, with Medina, Clinton, and

Niagara epochs. 2. Salina period, containing the Onondaga salt group. 3. Lower Helderberg period, containing the lower Helderberg limestone which includes in New York the water lime group, the lower pentamerous limestone, the delthyrs shaly limestone, and the upper pentamerous limestone. 4. Oriskany period, containing the Oriskany sandstone.

In the Acadian epoch the rocks are exposed to view in valleys in New Brunswick. They are gray and black shales with some sandstones, and have a thickness of 2,000 feet. In the Potsdam epoch in Labrador and Newfoundland are strata of limestones, sandstones, and shales from 5,000 to 5,600 ft. thick. In New York, Vermont, and Canada, rocks, lying upon the Archean, are hard sandstones, sometimes pebbly conglomerates. The sandstones are laminated, gray, drab, yellowish, brown, and red, often good building stone, as at Potsdam and Malone. In Clinton and St. Lawrence the conglomerate is often 300 ft. thick. In western Vermont there is red sandrock and Winooski limestone. Along the Appalachians the striking characteristic is the great thickness of the formation. In Pennsylvania there are in the primal series of Rogers 2,000 ft. of lower slates upon which rests 90 ft. of sandstone, and above this from 200 to 1900 ft. of upper slates. The pictured rocks on the s. shore of lake Superior, and the pillared rocks at the w. end of the lake are considered to be of Potsdam formation. The primordial rocks bear evidence only of marine life. The plants are chiefly fucoïds. The animals are all invertebrates, as erinoids, brachiopods, pteropods, gasteropods, and cephalopods, worms and crustaceans, including trilobites (q.v.).

The rocks of the Canadian period appear at the surface in northern New York, Canada, northern Michigan, and Wisconsin; also in the Green mountains, the eastern Appalachians, from New Jersey southward, and in Missouri, Arkansas, and the Rocky mountains. The fossil flora and fauna of the Canadian period much resemble that of the primordial, but are more particularly rich in graptolites (q.v.). The earlier part of the Trenton period was particularly limestone-making. A broad belt of limestone of this period extends from eastern New York to Wisconsin, Minnesota, and Missouri, including the Galena limestone. It forms the bluffs at Trenton falls. The general thickness is from 100 to 500 ft., reaching 1000, and in Pennsylvania, 2,000 feet. The Utica shale comes to the surface in the Mohawk valley. Sea weeds are the only known fossil plants. Among the radiates are erinoids and star fish, corals made their first appearance. Various mollusks were numerous, and among crustaceans trilobites were abundant. The strata are much upturned, some of them having a vertical position, others inclining from 10° to 90°, the greater part between 30° and 60°.

In the upper Silurian, the Niagara period contains Oneida conglomerates, in Oneida co., N. Y., the lower member of the Medina epoch, the upper being Medina sandstone. The conglomerate is 500 ft. thick in the Shawangunk mountains, where it is called Shawangunk grit. The rocks of the Niagara epoch are very extensive, occupying a large portion of the interior of the continent, and they are to a great extent limestones, this being also a limestone-making epoch. Near Niagara falls there are 165 ft. of limestone resting on 80 ft. of shale, and at the falls 85 ft. of limestone resting on 80 ft. of shale. Along the Appalachians the rocks have a thickness of 1500 feet. Niagara limestone occurs on the shores of Wellington and Barrow's straits and on King William's island, and common chain coral has been found in the Arctic regions. There is lead and copper in the Shawangunk grit in Ulster co. N. Y., and these metals are found in other Silurian rocks. Petroleum occurs in large quantities in Niagara limestone at Chicago, Ill., but is not easily worked. The only fossil plants are sea weeds. As to animals the sandstones of the Medina and Clinton groups contain the remains of many brachiopods and lamellibranchs, but only a few corals and erinoids. The Clinton and Niagara limestones, however, are rich in corals, erinoids, trilobites, and brachiopods, while there are but few lamellibranchs or muddy bottom mollusks. The fine sandy and clayey character of the Medina beds shows that at the time of their deposition central New York was an extensive area of low, sandy sea shores, flats and marshes, not exposed to heavy waves, and that a similar condition extended westward to Michigan. The beds of the Niagara epoch bear evidence of having been formed in deep seas, from the thickness of the limestones in the Mississippi basin and elsewhere. After the elevation of the Green mountains, according to Dana, there was a gradual sinking which moved the coast line eastward to the Hudson, so that over New York and the interior basin there was a vast limestone-making sea. At the same time there was another large sea in the St. Lawrence region. In the course of these oscillations, from the beginning of the Trenton to the close of the Niagara period there was a deposition of 12,000 ft. of rock along the Alleghanies.

SILURIDÆ, a family of malacopterous fishes, divided into many genera, and including a great number of species, mostly inhabitants of the lakes and rivers of warm countries. The siluridae exhibit great diversity of form. Their skin is generally naked, but some have a row of bony plates along the lateral line, and a few are completely mailed with bony plates. The dorsal fin is single in some; others have two dorsal fins, the second being sometimes adipose, as in the salmon family. The dorsal fin is sometimes armed with a strong spinous ray, and in most of the family the first ray of the pectoral fins is very strong and serrated, so as to be capable of inflicting a severe wound, and by

this these fishes are protected from alligators and other enemies. All have the mouth furnished with barbels, more or less numerous; the two principal barbels being on the upper lip, and formed by elongation of the intermaxillary bones. The barbels are believed to be organs of touch, probably of use in directing the fish to its prey. The bones of the head and other parts of the skeleton exhibit many peculiarities, into which we cannot enter. The siluridæ are generally inhabitants of muddy rivers, lurking among the mud. The only European species is the *SLY SILURUS*, SHEAT-FISH, or SHADEN (*silurus glanis*), the largest of European fresh-water fishes, and sometimes found in the sea near the mouths of rivers. It does not inhabit any of the rivers of Britain; its introduction has, however, recently been attempted. Neither is it found in France, Spain, or Italy, but it is plentiful in the Danube, the Elbe, and their larger tributaries, also in the rivers which fall into the Caspian sea; and it is found in some of the rivers of North America. It attains a length of six or even eight feet, and a weight of 300 or 400 pounds. The flesh is white and fat, but soft, luscious, and not very easily digestible. In the northern countries of Europe it is preserved by drying, and the fat is used as lard. The habits of the fish are sluggish. It seems rather to lie in wait for its prey than to go in quest of it.—Several species of this family are found in the Nile, among which is the *HARMOUTH* or *KARMOOT* (*clarias anguillaris*), a fish in its general form and appearance much resembling that just described. It was anciently an object of superstitious regard in the Thebaid.

SILVAS, or **SELVAS** (Span. *selva*, a forest), the name given to the western portion of the great plain of the Amazon, in the n.w. of Brazil. The silvas, which are about one-third of the whole plain, contain more than 700,000 English sq.m., and consist of low land on a dead level, densely covered with primeval forests, and annually inundated by the overflow of the mighty river or its tributaries. The forests are rendered wholly impenetrable from the denseness of the underwood, matted together as it is by creeping and climbing plants which form myriads of festoons glowing with nature's brightest tints. The vegetation of the silvas, under the stimulating action of the abundant irrigation, the intense tropical heat, and the inconceivable richness of the alluvium which constitutes the soil, shows an exuberance of growth far surpassing that of any other portion of the earth's surface, and from its very luxuriance presents a bar to civilization no less effectual than do the barren deserts of Africa or the gloomy wastes of central Asia. The few Europeans who have penetrated into this region have sailed up the Amazon and some of its tributaries, and from them we have received the little knowledge that we do possess of this immense tract of wild forest. It is the haunt of innumerable wild animals, especially monkeys and serpents, and of a few aboriginal inhabitants who are sunk in the lowest stage of barbarism.

SILVER (syrah, Ag, equiv. 108, sp. gr. 10.53) is a metal which, in its compact state, is of a brilliant white color, possesses the metallic luster to a remarkable degree, is capable of being highly polished, and evolves a clear ringing sound when struck. It is harder than gold, but softer than copper, and is one of the most ductile of the metals. It is malleable, may be hammered into very thin leaves, and may be drawn out into very fine wire, the thinnest silver-leaf having a thickness of only $\frac{1}{100000}$ of an inch, and one grain of the metal being capable of yielding 400 feet of wire. It possesses a high degree of tenacity, a wire with a diameter of $\frac{1}{12}$ of an inch being able to support a weight of nearly 188 pounds. It requires a heat of 1873° Fahr. to fuse it, and on cooling expands at the moment of solidification. It is an excellent conductor of heat and electricity, and is not affected by exposure, even to a moist atmosphere at any temperature. When, however, it is fused it absorbs a considerable quantity of oxygen which it expels in the act of solidification with a peculiar sound technically known as *spitting*.* But although it does not rust or become oxidized it usually becomes tarnished on prolonged exposure to the air, owing to the formation of a film of sulphide (or sulphuret) of silver, and this change occurs more rapidly in towns than in the country in consequence of sulphureted hydrogen being more abundant in the atmosphere of the former than of the latter. This metal is unaffected by the hydrates or nitrates of the alkalies, even at a high temperature, and hence silver crucibles, etc., are highly useful in many laboratory operations.

Hydrochloric and dilute sulphuric acid have scarcely any action on silver, but nitric acid and boiling sulphuric acid oxidize it, and form salts; nitric acid being by far its best solvent. Silver has strong affinities for chlorine, bromine, iodine, and sulphur, and combines with the first three and sulphureted hydrogen at ordinary temperatures. It is well known that common salt, especially in the melted state, when left for any time in contact with silver, corrodes that metal, soda being formed from the oxygen of the air, while the liberated chlorine attacks the silver.

Silver is frequently met with in the native state crystallized in cubes or octahedrons, or occurring in fibrous masses. It is also found in combination with gold, mercury, lead, antimony, arsenic, sulphur, etc., and sulphide of lead is almost always accompanied with a greater or less amount of sulphide of silver; it is, however, never found as an oxide.

Silver forms three compounds with oxygen—viz., a suboxide, Ag_2O ; an oxide,

* Although ordinary air has no oxidizing action on silver, ozonized air rapidly attacks it.

AgO ; and a peroxide, AgO_2 . All these oxides possess the common properties of being reduced by heat to the metallic state, and of being very readily decomposed by the action of light. The oxide, AgO , is the only one of these compounds requiring special notice. It is a dark-brown heavy powder, devoid of taste or smell, somewhat soluble in water, to which it communicates a metallic taste and an alkaline reaction. It acts as a powerful base, neutralizing the strongest acids, and forming normal salts with them. It is obtained by the addition of a solution of potash to a solution of the nitrate or any other soluble salt of silver, falling as a hydrated oxide, which, at a temperature above 140° , becomes anhydrous. If a concentrated solution of ammonia be digested for some hours upon freshly precipitated oxide of silver, fulminate of silver (q.v.), or fulminating silver in the form of a black powder is produced, and the same dangerous compound is formed when an ammoniacal solution of nitrate or chloride of silver is precipitated by potash.

The salts which the oxide of silver forms with acids are characterized by the readiness with which they decompose, the mere action of light blackening and partially reducing them. None of these salts occur in nature. The following are the most important of those which have been formed artificially:

Nitrate of Silver (AgO, NO_3) crystallizes in large, colorless, transparent square tablets, which blacken on exposure to light, or in contact with organic matters, owing to reduction, and dissolve in their own weight of cold water. This property of producing a permanent black color with organic matters has led to its employment as a *marking ink** for linen, etc. The black stains which it forms on the skin, on linen, etc., may be removed by the employment of a strong solution of iodide of potassium, or more readily by a solution of cyanide of potassium. The crystals fuse at a temperature of about 425° , and the molten mass, when cast into cylindrical molds, solidifies, and forms the sticks of *lunar caustic* which are employed in surgery, medicine, and photography (q.v.). Nitrate of silver is prepared by dissolving pure silver in moderately strong nitric acid, and evaporating till the solution is sufficiently concentrated to crystallize. "The most characteristic test for the salts of silver is the action of hydrochloric acid, or of a soluble chloride, which produces a white curdy precipitate of chloride of silver, insoluble in nitric acid, but readily soluble in ammonia; it is also soluble in hyposulphite of soda, with which it forms an intensely sweet solution; cyanide of potassium also dissolves it; the chloride of silver speedily assumes a violet tinge when exposed to light."—Miller's *Elements of Chemistry*, 2d ed., vol. ii. p. 732.

Of the haloid salts of silver, several occur native. The most important of these compounds is *chloride of silver* (AgCl), which is found native either in cubes or in a dense semi-transparent mass, and is known as *horn silver*, and may be procured as a dense white flocculent precipitate by the procedure described in the preceding paragraph. In consequence of its sensibility to light, it is employed in photography. When heated to about 500° , it fuses into a yellow fluid, which, on cooling, solidifies into a yellowish-gray semi-transparent horny mass. This salt is insoluble in water and in all the diluted acids, but dissolves in a solution of ammonia, from which it crystallizes in octahedra. Its solution in a solution of hyposulphite of soda is employed in silvering iron, copper, and brass goods. Traces of this salt are found in sea-water, the chloride of sodium probably acting as the solvent. *Bromide of silver* (AgBr) is found in Mexico, where it is known as *plata verde*, or green silver, in the form of small crystals or crystalline granules of a pale olive-green tint. *Iodide of silver* (AgI) occurs native in several Mexican mines in the form of thin, flexible, pearly scales.

Sulphide (or *sulphuret*) of silver (AgS) is the principal ore of silver. It occurs native, sometimes crystallized in cubes or octahedra, and sometimes in masses. From its gray metallic luster, it has received from mineralogists the name of *silver glance*. It is well known that if silver spoons are allowed to remain in contact with boiled eggs for some time, they become tarnished by the action of the sulphur; a minute quantity of sulphureted hydrogen being probably evolved. The discoloration is easily removed by washing the darkened silver with a solution of cyanide of potassium. Sulphide of silver unites with various other metallic sulphides when fused with them, especially with the sulphides of arsenic and antimony. *Red silver ore* ($3\text{AgS}, \text{SbS}_3$) is a native compound of this kind.

The alloys of silver and copper (see ALLOY and MINT), when cast into ingots, are usually found to differ in their composition in the internal and external parts, in consequence of a molecular change that takes place during the cooling and slow solidification of the molten mass. In bars containing more than 719 parts of silver in 1000, the central portions are richer in silver than the exterior; in alloys of less value, the reverse is observed, while in ingots containing 950 or more parts of silver in 1000, the composition is nearly uniform throughout. When exactly 719 parts of silver and 281 of copper are combined (corresponding to the formula $\text{Ag}_7\text{Cu}_{281}$), no separation whatever of the metals occurs. Many metals, as tin, zinc, antimony, bismuth, arsenic, etc., when

* Brande gives the following directions for preparing marking ink: Dissolve two drams of nitrate of silver and one dram of gum-arabic in seven drams of water, and color the liquid with Indian ink. The cloth must be first prepared by moistening the spot with a few drops of a soda solution, prepared by dissolving two ounces of crystallized carbonate of soda and two drams of gum-in four ounces of water. Professor Miller recommends as a cheap indelible marking ink, a solution of coal-tar in naphtha; it resists the action of chlorine, and is used by bleachers to mark their goods.

mixed with silver, render it brittle and unfit for its ordinary uses; they are, however, easily removed in the process of refining. An alloy consisting of 5 parts of silver, 6 of brass, and 2 of zinc, is used as a solder for silver. An alloy of silver and mercury, known as *silver amalgam*, occurs native in a crystallized form. It is a mineral of a silvery white color, and its composition is represented by the formula, AgHg_2 .

Silver, like gold, has been known and prized from the earliest ages. The silver mines of Mexico were, until quite recently, by far the richest known to exist. Their estimated annual yield is about 1,600,000 lbs. troy of the pure metal. Until the remarkable discoveries of silver ore in Nevada and adjoining states in 1859 and 1860, Chili and Peru had long stood next to Mexico in their yield, each furnishing about one-sixth of the produce of that country. Bolivia is also rich in silver; but the recent extraordinary development of silver mining in the western regions of the United States, appears to have raised their produce to at least a par with that of Mexico, so that these two countries now furnish three-fourths of all the silver obtained in the world.

Of European countries, Spain is the most productive, the richest mines being those of Huendelencina, in the province of Guadaluza, which were first extensively opened in 1846. These have yielded immense wealth, but their produce has much declined since 1858. Silver glance is the principal ore, although several others are found, including quantities of the formerly rare mineral freieslebenite, which contains about 23 per cent of silver. Next to Spain, Austria, Saxony, and the Harz district in northern Germany, yield the largest supplies. The silver mines of Königsberg in Norway are likewise valuable, and have been long famous. Great Britain has no silver mines, properly so called, but since the introduction in 1829 of Pattinson's process for the desilverizing of lead smelted from argentiferous galena, a large quantity has been annually produced in this way. The highest yield of silver by this process was in 1868, and amounted to 841,328 ounces, but owing to the gradual decline since then in the produce of British lead, the silver obtained from it had fallen in 1876 to 483,422 ounces (see LEAD). In the mineral veins of Cornwall, some "bunches" of true silver ore have occasionally been found, but of limited extent.

The forms in which silver is found in nature are numerous, but we need only notice a few of them. It is frequently found native in crystallized and amorphous masses, which are sometimes of considerable size. One fine piece found at Königsberg is now in the Copenhagen museum, and weighs 500 lbs. But the quantity of silver found in nature in the metallic state is comparatively small. Its principal ores are the different sulphides or sulphurets, viz., silver glance, or sulphuret of silver, containing when pure 87 parts of silver and 13 of sulphur; brittle silver ore, or sulphuret of silver and antimony, of which the composition is, silver 63.5, antimony 14.7, and sulphur 16.4; and red silver ore, called also ruby silver, of which there is a dark and a light kind, the composition of the former being similar to brittle silver ore, but it is a little less rich in silver, and the latter only differs in containing arsenic instead of antimony. The bulk of the silver obtained in Mexico and South America is got from these ores. The only other of much importance, except the mixed ores to be presently noticed, is horn silver, or chloride of silver. In a pure state, it consists of silver 75, and chlorine 25. It occurs extensively in Mexico and Peru, but is not common in European mines.

Beside the ores named above, a good deal of the silver of commerce is obtained from mixed ores, that is, the ores of other metals are frequently found to contain it. In many cases, the amount of silver falls greatly short of one per cent. These ores are for the most part sulphurets of lead, arsenic, copper, zinc, and iron.

In the reduction of silver ores, the processes followed are based upon the fact, that both lead and mercury have a strong affinity for silver. A more recent process depends upon the solubility of chloride of silver in a hot solution of common salt, and its separation again on cooling.

The simplest process is ordinary smelting, and is only applied to the richest ores. These are crushed, mixed with old slag, lead in some form, and a little iron ore and lime. The mixture is then heated in a furnace with charcoal, which brings down the silver and lead together as an alloy. The silver is afterward easily separated by cupellation, the principle of which is described in the article ASSAY; but on the large scale, instead of a small bone ash cupel, a cupellation furnace, say 6 feet in diameter, is used. Here the alloy is melted, bellows are used to remove the lead as litharge, or oxide of lead, and a cake of silver is left on the cupel forming the bottom of the furnace.

It happens that not many even of the richer ores are pure enough to be treated with advantage by simply roasting them with lead; accordingly, another plan, called the amalgamation process, is more commonly adopted. The following is an outline of the way in which this is practiced at Freiberg in Saxony. The vein stuff (largely silica), containing a mixed ore of lead, copper, zinc, etc., as sulphurets, and only from 3 to 3½ oz. of silver per cwt., is ground to powder as described under METALLURGY; but some sulphuret of iron is also present, or must be added. About ten per cent of common salt is then mixed with the ore, and the mixture heated in an reverberatory furnace (q.v.) to a temperature sufficient to expel water, and in part arsenic, zinc, and antimony. After two hours, the sulphur of the sulphurets takes fire, and is burned off as sulphurous acid, or converted into sulphuric acid, so that the metals become oxides and sulphates. The temperature of the furnace is now raised, when the chlorine of the common salt forms

volatile chlorides with zinc, antimony, and iron, and a fixed chloride with silver. During the roasting, the contents of the furnace are continually stirred, so that they ultimately form a coarse powder.

The product of the roasting furnace, after being ground to a fine powder, is mixed in the proportion of 10 cwt. with 3 cwt. of water and 1 cwt. of iron in fragments; the mixture being effected in oak casks, which are then made to revolve for two hours on their axes. During the operation the iron decomposes the metallic chlorides in the roasted ore, forming chloride of iron, while the copper is partly reduced to subchloride and partly to metallic copper. If there is not enough iron present to convert the copper into subchloride, then mercury will be wasted in the next stage by conversion into its subchloride. Quicksilver to the amount of 5 cwt. is next run into each of the casks, which are then set in motion, and continue for 22 hours at the rate of 12 revolutions per minute. The result of this is, that the silver being precipitate by the presence of metallic copper, is then dissolved by the mercury, but the amalgam so formed is usually a complex one.

In order to separate the amalgam from the earthy matters and the sulphates and chlorides, the barrels, which were hitherto only two-thirds full, are now filled with water (the dilution throwing down any chloride of silver held in solution by the sea-salt), and kept revolving for two hours; after which, by means of a stop-cock, the amalgam is allowed to flow into the amalgam chamber, and the rest of the contents, except the iron fragments, into a wash tun. The superfluous quicksilver has next to be separated from the amalgam. This is done in bags of ticking, through which the mercury at first flows readily by its own weight, and is afterward squeezed out on a flat surface. The result of this operation is, that the amalgam of mercury, silver, copper, etc., is left in the bags: its actual composition being nearly 85 per cent of mercury, 10 per cent of silver, and 5 of copper, lead, and antimony. Finally, the quicksilver of the amalgam itself is separated by heat in a distilling furnace. Here the amalgam is put into a row of iron pots, which go into a large retort. When heat is applied the quicksilver volatilizes, and is condensed in a pipe attached to the retort, from which it is collected in a trough. The impure silver left in the retort is refined by fusion and subsequent cupellation.

There is another process carried on at Freiberg and elsewhere, by which the use of mercury is dispensed with. It consists in treating the ore as above described till it leaves the roasting-furnace. At this stage the roasted ore is digested in a warm concentrated solution of sea-salt, which readily dissolves the chloride of silver. The solution is then passed through wooden tubs containing metallic copper, which has the property of decomposing the chloride of silver: the chlorine unites with the copper to form chloride of copper, and the silver is precipitated.

[This process is now for the most part abandoned, and at Freiberg an argentiferous copper matt obtained in smelting mixed ores is treated with sulphuric acid, by which sulphate of copper is formed, and the silver recovered from the residue.]

In Mexico, where indeed the process was first introduced, the extraction of the silver from its ores is chiefly accomplished by amalgamation, but the plan employed differs a good deal in its details from the Saxon method described above. Of late years the sodium-amalgam process of Mr. Crookes has been used with advantage for the extraction of silver in several American mining districts (see **SODIUM-AMALGAM**).

It has now become a common practice at Swansea, where the great British copper-smelting works are situated, to extract the silver which exists in an appreciable, though small quantity, in many copper ores. By one process copper smelted from an argentiferous ore is melted with three or four times its weight of lead, and cast into ingots. When these are moderately heated, the copper does not fuse, but the lead and silver melt, and run off together, and the silver is then separated by cupellation. From the burnt pyrites of vitriol works, so recently a waste product, not only is the iron and copper, but the silver, which exists in exceedingly small proportion, is now recovered by the use of iodide of potassium.

The physical and chemical properties of silver are such as make it specially valuable for many purposes in the arts; the chief of which are noticed in the articles **ALLOY**, **MINT**, **PLATING**, **GALVANISM**, and **PHOTOGRAPHY**. Ordinary mirrors have their *silvering* produced by a coating of an amalgam of tin and mercury; but for some years, mirrors coated by a patent process with real silver, and backed by a layer of some composition, which protects it from the blackening action of sulphureted hydrogen, have been made in great numbers.

MEDICINAL USES OF SILVER. *Nitrate of silver*, in small doses, constitutes an excellent tonic, and it appears to exert almost a specific influence over certain convulsive diseases. As a tonic, it is frequently prescribed in the early stages of phthisis, and in cases of irritability of the mucous membrane of the stomach, and epilepsy and chorea frequently yield to its influence, when many other remedies have been tried in vain. There is unfortunately one great drawback to its administration—viz., that when its use has been continued for some time, this salt communicates a permanent slate-like or bluish-gray hue to the skin. There is very little danger of this change of color occurring, if the medicine is not administered for a longer period than three months. In prescribing this salt, it is usual to begin with a small dose, about one sixth of a grain, and gradually to

increase it to two or three grains, three times a day. It is best administered in pills made with some vegetable extract. The surgical uses of nitrate of silver have been already noticed in the article on LUNAR CAUSTIC.

Oxide of silver is employed in the same cases as the nitrate. It is especially recommended in chronic affections of the stomach, and in menorrhagia. It may be given in the same doses as nitrate. *Chloride of silver* has been employed both in America and in Germany in the same cases as the nitrate, and in certain forms of syphilitic disease. It is stated not to produce the discoloration of the skin caused by the nitrate; but as the same statement was confidently made regarding the oxide, and was found to be fallacious, we are not inclined to put any faith in this assertion, especially as the nitrate must be at once converted into a chloride by the free hydrochloric acid of the gastric juice.

SILVER (*ante*). The great silver-mining industry of the United States had no existence before 1860. While, before that date, it was well known that a few ounces of silver could be extracted from a ton of almost any of the American galena ores; and while silver in combination with lead had been found in some instances, and in Davidson co., N. C., a mine had been worked with some activity for argentiferous galena, and a little silver had been found in the gold of California, there had been no discovery made in this direction which in the least indicated the vast possibilities of American silver production. The prospectors and pioneers who traversed Arizona, Idaho, Nevada, Colorado, and other territories in the far west, seeking for gold, in the years between 1850 and 1860, fell upon silver unexpectedly. The greatest silver mine ever known was discovered in this way in 1858-59, in the Washoe country, on the eastern foot-hills of the Sierra Nevada. This was the celebrated "Comstock" mine, which was found by James Shinney and Henry Comstock, both of whom parted with their interest for a trifle, not discerning the value of the discovery. The Comstock lode is situated in Storey co., Nevada, 25 m. from the w. border of the state, and 20 m. from Reno, on the Union Pacific railroad. A portion of the mine was worked in 1860-61, and by 1865 it had yielded to the value of \$30,000,000; and a city of 20,000 inhabitants was planted on its site. See VIRGINIA CITY. From 1859 to 1866 the total product of the mines on the Comstock lode was about \$70,000,000. The tremendous result of this discovery encouraged further prospecting, and it was soon found that the mountains of Colorado were full of similar veins; Idaho and Montana became in their turn silver-bearing territory; and the Wasatch range, looking down into the Salt Lake valley, was found to be rich in silver-bearing lodes. Up to Dec., 1878, the value of the silver yield of Colorado was about \$16,000,000. Two years later, the mines of Leadville alone, not discovered till 1877, yielded as much. The effect of the increased production of silver has been marked and important. From authoritative sources it is known that the exportation of the metal from countries w. to countries e. of Egypt, which was \$20,000,000 in 1873, had increased in 1877 to \$100,000,000. The mining fever of 1865-70 produced its inevitable result of calamity in 1873, which the discovery of the great "Bonanza" of the California and Consolidated Virginia only temporarily lulled. The interest in silver mines fell off with the bursting of bubble companies, and it was not until the remarkable Colorado discoveries had been fully authenticated in 1878-79, that a fresh enthusiasm brought silver-mining again into repute. See MINING STOCK COMPANIES. Following are the total gold and silver product of Nevada to 1879, and the silver product of the Comstock lode:

	Nevada, Gold and Silver.	Comstock, Silver.
1859.....	\$100,000	
1860.....	500,000	\$200,000
1861.....	2,300,000	500,000
1862.....	6,300,000	1,800,000
1863.....	12,500,000	6,500,000
1864.....	16,800,000	11,000,000
1865.....	16,800,000	10,000,000
18'6.....	16,000,000	70,800,000
1867.....	20,000,000	13,200,000
1868.....	15,000,000	11,600,000
1869.....	14,500,000	10,500,000
1870.....	16,000,000	9,500,000
1871.....	22,500,000	13,000,000
1872.....	25,600,000	15,000,000
1873.....	35,000,300	21,000,000
1874.....	35,500,000	20,800,000
1875.....	40,000,000	24,700,000
1876.....	49,300,000	36,500,000
1877.....	51,500,000	35,800,000
1878.....	35,000,000	19,000,000

Annual product of silver in the United States, 1858-1879:

1858.....	\$500,000	1869.....	\$12,000,000
1859.....	100,000	1870.....	16,000,000
1860.....	150,000	1871.....	23,000,000
1861.....	2,000,000	1872.....	28,750,000
1862.....	4,500,000	1873.....	35,750,000
1863.....	8,500,000	1874.....	37,324,594
1864.....	11,000,000	1875.....	31,727,560
1865.....	11,250,000	1876.....	38,783,016
1866.....	10,000,000	1877.....	39,793,573
1867.....	13,500,000	1878.....	45,281,385
1868.....	12,000,000	1879.....	40,812,132

Production of silver by states and territories in the United States for the year ending June 30, 1879:

California.....	\$2,400,000	Oregon.....	\$20,000
Nevada.....	12,560,000	Washington.....	20,000
Colorado.....	11,700,000	Dakota.....	10,000
Montana.....	2,225,000	Michigan (lake Superior).....	780,000
Idaho.....	650,000	Other sources.....	47,000
Utah.....	6,250,000		
Arizona.....	3,550,000		\$40,812,000
New Mexico.....	600,000		

SILVERING GLASS. See MIRROR.

SILVERSIDE or **SILVER FISH.** See *ATHERINE*, *ante*.

SIMARUBA CÆ, a natural order of exogenous plants, consisting of trees and shrubs; with alternate, generally compound leaves, without stipules; regular, generally hermaphrodite flowers. The species are not numerous; they are found in the tropical parts of Asia, Africa, and America. The whole order is characterized by great bitterness. *Quassia* (q.v.) and bitterwood (q.v) belong to it. The seeds of *simaruba cedron*, a small tree found in the isthmus of Darien and neighboring countries, are known by the name of *cedron*, are intensely bitter, and are greatly esteemed in Central America and New Granada as a cure for intermittents, dyspepsia, and other diseases.—**SIMARUBA BARK**, employed as a tonic in dyspepsia, dysentery, etc., is the bark of the roots of *simaruba amara*, a native of the West Indies, called *mountain damson* in Jamaica. It was first brought to Europe in 1713.

SIMBIRSK, a government of Russia, bounded on the e. by the Volga, and on the w. by the governments of Nijni-Novgorod and Penza. Area, 19,050 sq.m.; pop. '70, 1,205,881. The surface is for the most part level, and the soil of remarkable fertility, and there are excellent and extensive meadows and pasture-grounds. The fisheries and the commerce on the Volga, and cattle-breeding, are important.

SIMBIRSK, capital of the Russian government of the same name, on the right bank of the Volga, 229 m. s.e. of Nijni-Novgorod. Leather, soap, and candles are manufactured, considerable trade is carried on by the Volga, and there is a famous annual fair. During the years 1864 and 1865 Simbirsk suffered severely from fires. Pop. '67, 24,607.

SIMCOE, a co. in Ontario, Canada, bounded by Georgian bay and lake Huron on the n.w., and by lake Simcoe and Severn river on the e.; crossed by the Northern railroad; 1665 sq.m.; pop. '70, 57,389—English, Irish, Scotch, and French. The principal interests are lumbering and shipping. Co. seat, Barrie.

SIMCOE, JOHN GRAYES, 1752-1806; b. England; son of a capt. in the navy; killed at the siege of Quebec; was ensign in the army, 1770; a tory during the revolutionary war; raised and commanded the queen's rangers with the rank of lieutenant-col. He was wounded at the battle of the Brandywine and at Monmouth; was with Cornwallis at Yorktown. He wrote the history of the exploits of his battalion; was governor of upper Canada, 1791-94, governor of St. Domingo, 1796-97; lieutenant-gen., 1798; died in England. Lake Simcoe in Ontario was named in his honor. A journal of his campaigns was published for private circulation.

SIMCOE, LAKE, in central Ontario, having the counties of Ontario and York on the s. shore, Simcoe co. and the river Severn on the north. It is 30 m. long, 18 m. wide, and 170 ft. above lake Huron, into which it discharges through the Severn, lake Couchiching, and Georgian bay. White fish are found abundantly, and on Snake island is an Indian reservation. The margins are covered with thick forests. In the winter it is so solidly frozen as to be a serviceable highway.

SIMEON, Rev. CHARLES, an eminent evangelical preacher of the English church, was b. at Reading in Berkshire, Sept. 24, 1758. Educated at Eton and Cambridge, he was ordained a priest in 1782. His first religious impressions occurred during his residence at the university, and produced a permanent change in his character. From being a somewhat vain and dressy young gentleman, he passed into an ardent and zealous preacher of the cross, and this he remained during the 54 years of his public ministry.

His career was not marked by many incidents. Appointed vicar of Trinity church, Cambridge, in the year of his ordination, and vice-provost of his own college (King's) in 1790, he continued to hold these offices to the close of his life, Nov. 13, 1836. As a preacher Simeon was distinguished for an impassioned evangelicalism in language, sentiment, and doctrine, that at first roused against him a bitter and protracted opposition. His earnestness, however, met with its due reward. Friends and followers sprang up; and in course of time Simeon became a center of evangelical influence, that began to spread itself over the whole church, and gave birth to its great missionary activity in recent years. Simeon may even be regarded as the founder of the "Low-church" party, and on the whole, fairly represents their earnestness, dogmatism, mediocre intellect, and limited scholarship. For an account of Simeon's life and labors, see *Memoirs of the Rev. Charles Simeon*, by the rev. W. Curus (Lond. 1857). Simeon's *Horæ Homilæticæ* (21 vols., 1832) are very popular among sermon-readers and sermon-makers of evangelical tendencies.

SIMEON STYLIËTS. See PILLAR-SAINTS.

SIMEON, TRIBE OF, containing at the exodus 59,300 men fit for war, was reduced in the wilderness to 22,000. This great decrease, bringing down the tribe from the third place to the lowest in point of numbers, was much more than the aggregate loss of the four other diminished tribes; while the remaining seven had been largely increased.

SIMFEROPOL, a t. of Russia, in the Crimea, capital of the government of Taurida, stands on the Salghir, 45 m. n.e. of Sevastopol. The valley of the river is studded with charming villas, and the town is surrounded by gardens, and has a picturesque appearance. The older part comprises the old Tartar town of Ak-Metchet or White Mosque; the new part, containing the government buildings, is very handsome. Fruits are largely grown in the vicinity, and exported. Pop. (1867) 17,797.

SIM'IA AND SIMIADÆ. See MONKEY.

SIMILAR FIGURES, in geometry are figures which exactly correspond in shape, but may or may not be of the same size. If the figures be rectilineal, then the criterion of similarity is that every pair of corresponding sides should have the same ratio to each other, and that each angle of the one figure should be equal to a corresponding angle of the other. If the figures be triangular, the proportionality of the sides carries with it the equality of the angles, and *vice versa*, but only in this case. *Similar segments of circles* are those in which, and on whose bases similar triangles can be inscribed; or as it is otherwise expressed, those which contain equal angles—a satisfactory test that they are each the same part of their respective circles. *Similar solids* are those which are bounded by similar planes similarly situated to each other. All similar plane figures are to one another as the squares of any corresponding sides, and all similar solids are as the cubes of their corresponding sides. Thus, a circle which has 3 (3:1) times the diameter of another has 9 (3²:1²) times its area, and a globe which has 3 (3:1) times the diameter of another has 27 (3³:1³) times the volume.

SIMLA, a British sanatorium in the n.w. of India, about 170 m. in direct line n. of Delhi. It consists of a number of houses irregularly scattered over a mountain ridge, with a noble panorama expanding on all sides of it. European fruits and vegetables are successfully cultivated, and the climate is salubrious. The pop., which is very fluctuating, was given in 1871 at 7,037.

SIMMS, WILLIAM GILMORE, American author, was b. at Charleston, S. C., April 17, 1806, of Irish extraction. He made verses at the age of 7; and during the war of 1812, celebrated in rhyme the exploits of the American army and navy. Left in charge of his grandmother at Charleston, he was placed with a druggist; but at 18 began the study of law; was admitted to the bar at 22; published *Early Lays and Lyrical and Other Poems* (1827), and became (1828) editor of *The City Gazette*, and published *The Vision of Cortes*, *Cain and Other Poems* (1829), and *The Tri-Color*, a poetical glorification of the French revolution (1830). In 1832, his paper, opposing nullification, failed; and he lost his wife, father, and grandmother, and took refuge in New England, where at Hingham, Mass., he wrote his best poem, *Atlantis, a Story of the Sea* (1833); and the same year *Martin Faber*, the story of a criminal. From this time he poured out rather than wrote poems, novels, histories, and biographies in rapid succession, which may best be classed in groups. Of poems, he published *Southern Passages and Pictures* (1839); *Donna Anna* (1843); *Grouped Thoughts and Scattered Fancies* (1845); *Lays of the Palmetto*—ballads of southern heroism in the war with Mexico (1848); *Poems, Descriptive, Dramatic, and Legendary* (1854); *Aretyos, or Songs and Ballads of the South* (1860). Of dramas—*Norman Maurin, or the Man of the People*; *Michael Bonham, or the Fall of the Alamo*; and a stage adaptation of *Timon of Athens*. Of prose romances of the imagination—*The Book of My Lady* (1833); *Carl Werner* (1838); *Confession, or the Blind Heart* (1842); *Castle Dismal* (1845); *The Wigwam and the Cabin*, two series (1845, 1846); *Marie de Bernière* (1853). Of historical romances—*The Yemassee* (1835); *Pelayo* (1838); *Count Julien* (1845); *The Damsel of Davien* (1845); *The Lily and the Tulip, or the Huguenots in Florida* (1845); *The Maroon and Other Tales* (1855); *Vasconcelos* (1857); *Cassique of Kiavah* (1860). Of revolutionary stories—*The Partisan* (1835); *Mellichamp* (1851); *Katherine*

Walton (1851); *The Scout* (1841); *The Kinsman, or the Black Riders of the Congaree* (1841); *Wondercraft* (1855); *The Foragers* (1855); *Entaw* (1856); these five being stories of the war in the Carolinas. Of local tales—*Guy Rivers* (1834); *Richard Hurdis* (1838); *Border Beagles* (1840); *Beauchamps* (1842); *Helen Halsey* (1845); *The Golden Christmas* (1852); *Charlemont* (1856). His other works comprise a *History of South Carolina*; *South Carolina in the Revolution*; *Liecs of General Marion, Captain John Smith, Chevalier Bayard, General Greene*; *Civil War in the South*; *American Loyalists of the Revolution*; *Views and Reviews of American Literature*; *The Morals of Slavery*, etc. Residing in South Carolina during the war of secession, he sustained the southern cause in a weekly newspaper, and had his house and library wrecked by federal soldiers. Of his various and voluminous works, some are of high excellence. He died in 1870.

SIMODA (Lowland), a harbor of Japan, at the southern extremity of Cape Idzu, and about 80 m. from Yedo, opened to foreign commerce by the Americans in 1854. In 1854 the town was nearly destroyed by an earthquake, while the harbor was so scoured out that hardly any holding-ground was left for ships on the granite bottom. The pop. was formerly estimated at 80,000, but is now reckoned at about 4,000.

SIMON, JULES (JULES FRANÇOIS SUISSE-SIMON), b. France, 1814; received his education at the colleges of Lorient and Vannes; and was tutor of philosophy in the lycœum of Caen in 1836. He became a disciple of Cousin, who invited him to Paris, and whose place he supplied at the Sorbonne, in the department of the history of philosophy. He was decorated with the legion of honor in 1845, and became a member of the academy of moral and political sciences in 1863. Simon entered into politics in 1846, and was elected a member of the assembly two years later, as a moderate republican. In 1849 he was elected a member of the council of state, but only held the position for a few months, when he went out of office. He refused to take the oath of allegiance to the empire after the *coup d'état*, and his lectures before the Sorbonne were accordingly suspended. In 1863 he was sent to the corps législatif, and soon became the chief of the republican party. In the cabinet of M. Thiers he held the portfolio of public instruction. In 1875 he was elected a member of the French academy. In 1876 he was director of the *Sécle* newspaper, and leader of the republican left in the national assembly; and in that year, called to form a ministry, he became president of the council, and minister of the interior. M. Simon's most recent act was his determined opposition to the amnesty bill for the communists, in July, 1880. He is the author of many works on government and philosophy.

SIMON, RICHARD, a distinguished orientalist and critical scholar, was born at Dieppe, May 13, 1638. Having completed his studies, he entered the congregation of the oratory in 1659, but soon afterward withdrew. He returned, however, in the latter part of 1662. For a time he delivered lectures on philosophy in the college of Juilly; but his studies eventually turned upon theology, oriental languages, and biblical criticism. At one time he thought of entering the Jesuit order, but he remained in the oratory; and it was while still a member of that congregation that he published his well-known work on the doctrine of the oriental church regarding the eucharist, designed as a supplement to the celebrated *Defense of the Perpetuity of the Faith in the Blessed Eucharist*, by Arnauld and Nicole, but criticising that work very severely. This and other controversies to which his later writings gave rise led to his again withdrawing from the oratory in 1678. In that year he retired to Belleville, as curé; but in 1682 he resigned his parish, and lived in literary retirement, first at Dieppe, and afterward in Paris. His health having given way, he returned once again to his native place, Dieppe, where he died in April, 1712. Few writers of his age played so prominent a part in the world of letters, and especially in its polemics. There is hardly a critical or theological scholar among his contemporaries with whom he did not break a lance—Spanheim, Le Clerc, Du Pin, Jurieu, and Jurieu's great antagonist, Bossuet. The principal work of Simon is his *Histoire Critique du Vieux Testament* (Paris, 1678), in which he anticipates the most important conclusions of all the later rationalistic scholars of Germany, and also their method of investigation. For example, he conceives himself to have disproved the Mosaic authorship of the Pentateuch, and assigns its composition to the scribes of the time of Ezra. Other writings of Simon's are: *Histoire Critique du Texte du Nouveau Testament* (Rotterdam, 1689); *Disquisitiones Criticæ de variis Bibliorum Editionibus* (1684); *De l'Inspiration des Livres Sacrés* (Rotterdam, 1687); and *L'Histoire Critique des Principaux Commentateurs du Nouveau Testament* (Rotterdam, 1692), in which he assails the theology of the fathers, and particularly that of Augustine, as a departure from the simple and less rigid doctrines of the primitive church. Among the fathers, his most esteemed authority was Chrysostom. Bossuet replied to this last work by his *Defense de la Tradition et des Saints Pères*. Simon frequently published under assumed names—as his *Dissertation Critique* on Dupin's *Library of Ecclesiastical Writers* under the name of Jean Reuchlin; a work, *Histoire Critique sur la Grèce et des Coutumes des Nations du Levant*, under the anagram of Monis; and a *Histoire de l'Origine et du Progrès des Revenus Ecclesiastiques* under the name of Jerome Acosta. No collected edition of his works has ever appeared; in the natural progress of the science of criticism, the most famous of them have lost most of their prestige, and are displaced by recent, and often second-hand, compilations upon the subjects, which, in the days of Simon, were comparatively new and unexplored; but still

there is much to be learned even from such of his works as have been forgotten by ordinary students.

SIMONIDES, a celebrated Greek lyric poet, was born at Iulis, in the island of Ceos, in the year 559 B.C., and educated probably with a view to making music and poetry a profession. He left his native island on the invitation of Hipparchus, who, by means of great rewards, induced him to reside at Athens, where also lived at that time Anacreon and Lasus, the teacher of Pindar, although no intimacy seems to have sprung up between Simonides and his two rivals. It was probably after the expulsion of Hippias (510 B.C.) that he took up his residence in Thessaly, under the patronage of the Aleuads and Scopads, who appear to have treated him in a very niggardly fashion. Shortly before the invasion of Greece by the Persians, he returned to Athens, and employed his poetic powers in the composition of elegies, epigrams, dirges, etc., in connection with that momentous struggle, taking the prize, in regard to the battle of Marathon, out of the hands of his rival Æschylus. In the year 477 B.C., when Simonides was 80 years of age, he came off victor for the 56th time in a poetical contest at Athens. Shortly after this he went to reside at the court of Hiero of Syracuse, where he died in 467 B.C., at the age of 90. Simonides appears to have scandalized his contemporaries by writing for hire; and Pindar, his great rival, accuses him, apparently not without good reason, of excessive avarice. His poetry is imbued with a comparatively high morality. He brought to perfection the elegy and epigram, and excelled in the dithyramb and triumphal ode; he seems also to have completed the Greek alphabet by the addition of the double letters and long vowels, and to have invented the art of artificial memory. The characteristics of his poetry are sweetness, polish combined with simplicity, genuine pathos, and great power of expression, although in originality he is much inferior to his contemporary Pindar. The best edition of his fragments is that of Schneidewin, entitled *Simonidis Cœi Carminum Reliquiæ* (Brunswick, 1835).

This Simonides must be carefully distinguished from the iambic poet SIMOXIDÉS of Amorgos, who flourished about 100 years previous to Simonides of Ceos.

SIMONTON, JAMES W., b. N. Y., 1824; received a common school education in the city of New York; in 1845 entered the city department of a local newspaper as law reporter. He was afterward Washington correspondent of the *New York Courier and Enquirer*. In 1850 he visited San Francisco; and again in 1859, when he was connected with the *Bulletin* and other newspapers, as part proprietor, and also in an editorial capacity. He was employed on the original editorial staff of the *New York Times*; and for a number of years acted as its Washington correspondent. During the war of the rebellion he was actively engaged as a war correspondent. In 1865 he was appointed superintendent of the associated press, a position which he has continued to hold.

SIMONY, in English law, is the corrupt presentation of any one to an ecclesiastical benefice for gift money or reward, and is so called from its resemblance to the sin of Simon Magus. In the canon law it was considered a heinous crime, and a kind of heresy. As the canonical punishment, however, was not deemed sufficient, a statute was passed in the time of Elizabeth, defining its punishment. A simoniacal presentation was declared to be utterly void, and the person giving or taking the gift or reward forfeited double the value of one year's profit; and the person accepting the benefice was disabled from ever holding the same benefice. Presentation bonds, however, taken by a patron from a presentee to resign the benefice at a future period in favor of some one to be named by the patron, are not illegal provided the nominee is either by blood or marriage an uncle, son, grandson, brother, nephew, or grand nephew of the patron, and provided the bond is registered for public inspection in the diocese. The result of the statutes is that it is not simony for a layman or spiritual person, not purchasing for himself, to purchase while the church is full, either an advowson or next presentation, however immediate may be the prospect of a vacancy, unless that vacancy is to be occasioned by some agreement or arrangement between the parties. Nor is it simony for a spiritual person to purchase for himself an advowson, although under similar circumstances. It is, however, simony for any person to purchase the next presentation while the church is vacant; and it is simony for a spiritual person to purchase for himself the next presentation, although the church be full.

SIMOOM, or SIMOON (otherwise written Simoun, Semoun, Samoun, Samūn), or Sambuli, a name derived from the Arabic *samma*, signifying hot, poisonous, or generally whatever is disagreeable or dangerous, and applied to the hot suffocating winds which are peculiar to the hot sandy deserts of Africa and western Asia. In Egypt it is called *khamzin* (Ar. fifty) because it generally continues to blow for 50 days, from the end of April to the time of the inundation of the Nile.

Owing to the great power of the sun's rays, the extreme dryness of the air, and the small conducting power of sand causing the accumulation of heat on the surface, the superficial layers of sand in the deserts of Africa and Arabia often become heated to 200° Fahr. to a depth of several inches. The air resting on this hot sand becomes also highly heated, thus giving rise to ascending currents; air consequently flows toward these heated places from all sides, and these different currents meeting, cyclones or whirling masses of air are formed, which are swept onward by the wind prevailing at the time. Since the temperature, originally high, is still further raised by the heated grains

of sand with which the air is loaded, it rapidly increases to a degree almost intolerable. In the shade it was observed by Burckhardt in 1813 to have risen to 122° ; and by the British embassy to Abyssinia in 1841 to 126° . It is to the parching dryness of this wind, its glowing heat (about 200°), and its choking dust, and not to any poisonous qualities it possesses, that its destructive effects on animal life are to be ascribed.

The approach of the simoom is first indicated by a thin haze along the horizon, which rapidly becomes denser and quickly overspreads the whole sky. Fierce gusts of wind follow, accompanied with clouds of red and burning sand, which often present the appearance of huge columns of dust whirling forward; and vast mounds of sand are transported from place to place by the terrible energy of the tempest. By these mounds of sand large caravans are frequently destroyed; and even great armies have been overwhelmed by them, as in the case of Cambyzes, who was overtaken by the simoom on his march through the desert to pillage the temple of Jupiter Ammon, and perished with 50,000 of his troops. The destruction of Sennacherib's army is supposed to have been caused by the simoom. The simoom generally lasts from 6 to 12 hours, but sometimes for a longer period.

The effects of this wind are felt in neighboring regions, where it is known under different names, and it is subject to important modifications by the nature of the earth's surface over which it passes. In Italy it is called the *sirocco*, which blows occasionally over Sicily, s. Italy, and adjoining districts. It is a hot moist wind, receiving its heat from the Sahara and acquiring its moisture in its passage northward over the Mediterranean. It is the plague of Sicily and Naples, and while it lasts a haze obscures the atmosphere, and such is the fatigue which it occasions that the streets of Palermo become quite deserted. The *sirocco* sometimes extends to the shores of the Black and Caspian seas, and under its blighting touch sheep and cattle die in the steppes beyond the Volga, and vegetation is withered and dried up. It is called the *samiel* in Turkey from its reputed poisonous qualities.—The *solano* of Spain is a s. e. wind, extremely hot, and loaded with fine dust, which prevails at certain seasons in the plains of Mancha and Andalusia, particularly at Seville and Cadiz. It produces giddiness and heats the blood to an unusual degree, causing general uneasiness and irritation; hence the Spanish proverb, "Ask no favor during the solano."—The harmattan (q.v.) of Guinea and Senegambia belongs to the same class of winds.

SIMPLE CONTRACT in English law means any contract which is constituted by word of mouth or by a writing not under seal. See **CONTRACT**.

SIMPLON (Ital. *Sempione*), a famous mountain of Switzerland, one of the Lepontine Alps, in the e. of the canton of Valais, and near the Piedmontese frontier, rises to the height of 11,124 feet. The *Simplon road*, one of the greatest engineering achievements of modern times, leads over a shoulder of the mountain from which it derives its name (the *pass of the Simplon*, 6,592 ft.) from Brieg in Valais to Domo d'Ossolo in the n. of Piedmont. The road was commenced in 1800 under the direction of Napoleon and was completed in 1806. It is from 25 to 30 ft. broad, and has nowhere a slope greater than 1 in 13. It is carried across 611 bridges, over numerous galleries cut out of the natural rock, or built of solid masonry, and through great tunnels. Close to the highest point is the *New Hospice*, one of the 20 edifices on this route for the shelter of travelers.

SIMPSON, a co. in s. Kentucky, bordering on Tennessee; drained by Red river and branches of the Big Barren; traversed by the Louisville, Nashville and Great Southern railroad; 375 sq. m.; pop. '80, 10,641—10,574 of American birth; 2,795 colored. The surface is level and the soil rich; over 1,000,000 lbs. of tobacco are raised yearly; corn, wheat, wool, butter, and sorghum molasses are the other staples. Co. seat, Franklin.

SIMPSON, a co. in s. e. Miss., bordered by Pearl river on the w., and drained by Strong river; 625 sq. m.; pop. '80, 8,005. The surface is level and partly covered with forests of pine; the soil is sandy. The principal productions are cotton, Indian corn, sweet potatoes, and wool. Cattle, sheep, and swine are raised in large numbers. Co. seat, Westville.

SIMPSON, Sir JAMES YOUNG, was b. at Bathgate, Linlithgowshire, in 1811. He early showed a peculiar talent for medical observation and research; and in the prosecution of his professional studies at the university of Edinburgh, so attracted the notice of his teachers as to inspire all of them with an active interest in his future career. He graduated as doctor in medicine in 1832, on which occasion his inaugural thesis won the highest admiration. Prof. Thomson chose him as his professional assistant, and employed him in the preparation of his course of lectures on general pathology. During the illness of the professor, Mr. Simpson supplied his place in the lecture-room with unusual skill and address. He now began professional practice on his own account; and in 1840 succeeded prof. Hamilton as professor of midwifery in the university of Edinburgh. This position he has held with yearly enhanced distinction, and by the rigidly scientific while popularly attractive character of his prelections, has contributed greatly to the renown of the Edinburgh school, both at home and abroad. He was indefatigable, amid the distracting cares of an extensive practice, in promoting the scientific perfection of his art; and his two volumes of *Obstetric Memoirs*, edited by Drs. Priestly and Storrer, contain the fruits of much patient and ingenious research. The

discovery by which he will be more particularly remembered, however, is that of the anæsthetic virtues of chloroform. The so-called sulphuric ether had been employed in America by Morton to produce anæsthesia during labor; but to Simpson belongs the credit of having, in 1847, first introduced to the scientific world the far safer, more certain, and now universally adopted agent of chloroform. Another innovation which surgical practice owes to prof. Simpson is the stoppage of hemorrhage by acupressure. In his own peculiar field of obstetrics, his improvements on the old methods of practice are numerous and valuable; while his contributions to antiquarian research would of themselves create an independent reputation in that field. Besides the *Obstetric Memoirs* already mentioned he published a volume on acupressure; and many papers and notices read before the royal and antiquarian societies of Edinburgh. Among these may be enumerated: Antiquarian Notices of Leprosy; On the Contagiousness of Cholera; Ancient Roman Medicine Stamps; Was the Roman Army provided with Medical Officers? On Syphilis in Scotland, etc. His scientific services were recognized by innumerable medical associations; while his professional distinction secured for him a baronetcy in 1866. He died May 6, 1870. A statue of Simpson was erected in Edinburgh in 1877. See the Memoir by Duns (1873).

SIMPSON, JOSIAH, 1815-74; b. New Brunswick, N. J.; graduate of the college of New Jersey, 1833; university of Pennsylvania school of medicine, 1836; assistant-surgeon U. S. army, 1837, surgeon, 1855, brevet col., 1865. He served in the Indian war in Florida as surgeon of the 6th infantry, and through the Mexican war, participating in the triumphant entrance into the city of Mexico. He was post-surgeon at Bedloe's island, 1848-55, was assigned to duty on the Pacific coast, and during the war of the rebellion in the department of the Tennessee. He was attending surgeon in Baltimore from 1867 until his death.

SIMPSON, MATHEW, D.D., LL.D., b. Ohio, 1811; began the study of German at the age of 8, and the following year read through the German Bible; graduated at Alleghany college, Meadville, Penn., in 1832; took medical degree in 1833; entered the ministry in the Methodist Episcopal church the same year; professor of the natural sciences at Alleghany college in 1837; president of Indiana Asbury university at Greencastle, Ind., 1839-41; appointed editor of the *Western Christian Advocate* in 1848; elected bishop in 1852; visited the Methodist missions in Syria and the east in 1863; the Mexican missions in 1874, and was a delegate to the European missionary conferences in 1875. He was an intimate personal friend of president Lincoln, took a deep interest in the national cause during the war of the rebellion, and by his zeal and eloquence contributed much to encourage the government in that fearful crisis. He is one of the most eloquent preachers of the day, and has great influence in the Methodist church. He published *A Hundred Years of Methodism*.

SIMROCK, KARL, a German poet and scholar, who has done more perhaps than any other man to make his countrymen familiar with their early literature, was b. at Bonn, Aug. 28, 1802. He studied at the university of his native city and afterward at Berlin, and in 1823 entered the Prussian state service. His first work was a translation into modern German of the *Nibelungenlied* (Berl. 1827; 9th ed. Stuttg. and Tüb. 1854), followed by a translation of the songs admitted by Lachmann to be genuine, under the title *Zwanzig Lieder von den Nibelungen* (Bonn, 1840). Soon after the publication of his translation of Hartmann von der Aue's *Armer Heinrich* (Berl. 1830), he was compelled to leave the Prussian service on account of a revolutionary poem which he wrote. Afterward he devoted himself exclusively to literature, and more particularly to the early literature of his own country, which he has modernized in splendid style. In 1850 he was appointed professor of German language and literature at Bonn, a situation which he held till his death, which occurred in July, 1876. His principal works, besides those already mentioned, are: *Quellen des Shakespeare in Novellen, Märcchen, und Sagen* ("Sources of Shakespeare in Novels, Tales, and Legends," 3 vols. Berl. 1831), executed in conjunction with Ecktermeyer and Henschel, but of which the most important part was Simrock's; *Novellenschatz der Italiener* (Berl. 1832); a translation, with commentary, of the poems of Walther von der Vogelweide (2 vols. Berl. 1833), in conjunction with Wackernagel; and of *Wieland der Schmied, Deutsche Heldensage* (Bonn, 1835), one of the freshest of the German mediæval epics; *Rheinsagen aus dem Munde des Volkes und Deutscher Dichter für Schule, Haus, und Wanderschaft* ("Legends of the Rhine from the Mouth of the People and German poets, for School, Home, and Traveling," 4th ed. Bonn, 1850; latest ed. 1857); a collection of German *Folksbücher* ("People's Books"), comprising national proverbs, songs, and riddles, besides a vast quantity of stories (these, carried on for several years, include many vols.); a translation of Wolfram von Eschenbach's *Parzival und Titurel* (Stuttg. and Tüb. 1842); and *Das Heldenbuch*, partly translations and partly original poems (1843-49), illustrative of the heroic traditions of the Teutonic race. A separate collection of his own poems (*Gedichte*) was published at Leipzig (1844, new ed. 1863). Later productions are a translation of the songs of the Edda (Stuttg. and Tüb. 1851, 3d ed. 1863); a *Handbuch der Deutschen Mythologie* (2 vols. Bonn, 1853-55, 2d. ed. 1864); an *Altdeutsches Lesebuch in Neudeutscher Sprache* (Stuttg. and Tüb. 1854); *Das Deutsche Kinderbuch, Reime, Lieder, etc.* (1856-57); *Der Wartburg-Krieg, Herausgegeben, Geordnet, Übersetzt, und Erläutert* (1858); *Die Nibelungenstrophe und ihr Ursprung; Beitrag*

zur Deutschen Metrik (1858); *Lieder vom Deutschen Vaterlande* (1863); *Deutsche Märchen* (1864); *Gedichte Shakespeare's* (1867).

SIMS, CHARLES N.; b. Ind. in 1835. His early life was spent on a farm, and his education obtained at the common schools; began teaching at the age of 17; graduated at the Indiana Asbury university in 1859; elected the same year principal of Johnstown academy, the leading Methodist institution in Indiana; chosen president of the Valparaiso (Ind.) college; was appointed pastor of Pearl street church, Richmond, Ind.; was subsequently settled at Wabash, Evansville, Indianapolis, Baltimore, Newark, and Brooklyn; was elected chancellor of the Syracuse university in 1880.

SIMS, JAMES MARION, b. in S. C., 1813; graduated at South Carolina college in 1833; studied medicine at Charleston and Philadelphia; commenced practice at Montgomery, Ala., in 1836. About 1845 he established a private hospital at the latter city for the cure of vesico-vaginal fistula, in the treatment of which he used silver-wire sutures, publishing an account of the operation in the *American Journal of Medical Sciences*, in 1852. He settled in New York city in 1853, and was instrumental, with others, in establishing the women's hospital, for the treatment of diseases peculiar to women. In 1861 Dr. Sims went to Europe, where he performed several surgical operations by invitation, receiving decorations from the French, Italian, Spanish, Portuguese, and Belgian governments. Dr. Sims has written on *Trismus Nascentium*; *Silver Sutures in Surgery*; *On Intra-uterine Fibroid Tumors*, *Clinical Notes on Uterine Surgery*, and is the author of a standard work on female surgery. He is a member of many learned societies in Europe and America, and was president of the American medical association in 1876.

SIMSON, ROBERT, a celebrated Scotch mathematician, was b. at Kirton Hall in Ayrshire, Oct., 1687. He was educated at the university of Glasgow with a view to the clerical profession, and attained great eminence in classical and mathematical knowledge. His taste for mathematics gradually gained the ascendancy, and all other pursuits were abandoned. After a brief residence in London, during which he made the acquaintance of Dr. Halley, Mr. Dutton, and others, he returned to Glasgow, where in 1711 he was appointed professor of mathematics, and for 50 years discharged his professorial duties. Simson's reputation rests chiefly on his "restorations," or, as they might more properly be called, "reconstructions," of the Greek geometers. Some good judges are of opinion that he has corrected many errors in the original text, though his respect for the Greek mathematicians always led him to refer these to the ignorance of editors and the negligence of copyists. His first attempt in this direction was to discover the signification of Euclid's porisms, the only datum being a most obscure and tantalizing description of them by Pappus, the indefiniteness of which had foiled both Fermat and Halley. In this difficult task Simson, however, succeeded; and a similar attempt, attended with similar success, on the "loci plani" and the "sectio determinata" of Apollonius, stamped him as one of the most elegant geometers of modern times. With the thorough insight which he had thus obtained into the nature and processes of the Greek analysis, he set himself to the correction of Euclid's *Elements*. This last work was published in 1753, and has deservedly enjoyed a high character; it has been frequently re-edited and republished as a school-book, especially the edition by Playfair. Simson also published, along with his edition of Euclid, a list of Euclid's "data," of which he subsequently issued a second edition; but of his other works, some of which were almost ready for publication, none were printed till after his death. He retired from his professorship in 1761, and employed himself chiefly in the correction of his various works till his death, Oct. 1, 1768. Eight years after Simson's death, earl Stanhope caused to be published (for private circulation) at his own expense, the work on porisms, the two restored works of Apollonius, a posthumous tract on ratios, and another on logarithms; and an edition of Pappus, which was discovered after Simson's death, was presented to the university of Oxford.

SIN is the name given by theologians to the evil of human nature, to the moral defect or perversion which appears an inherent quality of the human will, and in a greater or less degree unavoidably characterizes it in this life. It is something more than evil as affirmed of the external world or of the lower creation. *Evil*, as denoting decay or corruption in nature, is admittedly a mere relative term, for in truth decay is just as normal a process of creation as renovation, and corruption is the condition of restored health and beauty. In a similar manner, evil, such as it exists in the lower animal creation, in the form of *prey* and in the forms of pain, of sickness, and of death—whatever be the special view taken of such phenomena—is never reckoned evil in the sense of *sin*. In order to constitute the special idea of sin, it is always necessary to suppose a moral element in the evil to which it is applied. Whatever form of evil is independent of the human will as its source, origin, or agent is not sin. Theologians, indeed, speak of original sin or the sin of human nature, as distinguished from actual sin, or the particular transgression of the individuals composing mankind. According to a common theological view, men are not only sinners individually, but they are partakers of a sinful nature, with which their will has had nothing to do—with reference to which they have had no choice of good or evil. The evil has come to them by natural descent from the original parents of the race. But even the most extreme view of original sin preserves a hypothetical relation between every individual will and the primal transgression which

it considers to be sin, not merely in those who committed it, but in those who have descended from them. All mankind are supposed to have been in Adam, the first sinner, as their representative, so that "they sinned in him and fell with him in his first transgression." Without such a hypothesis of unity between Adam and his race, so that his will was in some measure the typical or representative will of the race, the notion of original sin could not be maintained. For the relation between sin and will as a moral power, having the choice of good and evil, is a cardinal relation without which it would seem impossible to distinguish sin as a quality from other forms of evil in the world.

SINAI, the mount on which, according to the Pentateuch, God announced to Moses the ten commandments and the other laws by which the Israelites were to be bound. Its exact position is matter of dispute among travelers, but it is to be sought for in the mass of granite and porphyry mountains occupying the greater part of the Arabian peninsula, lying between the gulf of Suez and Akabah, and rising to a height of 8,600 or 9,000 ft. above the sea. This mountain-mass is divisible into three groups: a north-western, reaching, in mount Serbal, an elevation of 6,340 feet; an eastern and central, attaining, in Jebel Katherin, a height of 8,160 feet; and a south-eastern, whose highest peak, Um Shamer, is the culminating point of the whole Sinaitic range. Serbal, with its five peaks, looks the most magnificent mountain in the peninsula, and is identified with Sinai by the earlier church fathers, Eusebius, Jerome, Cosmas, etc.; but it does not meet the requirements of the Hebrew narrative, and even as early as the time of Justinian, the opinion that Serbal was the Sinai of Moses had been abandoned, and to a ridge of the second or eastern range that honor had been transferred, the northern summit of which is termed Horeb; and the southern, Jebel Mûsa, or mount of Moses, continues to be regarded by the great majority of scholars as the true Sinai. Its height is variously estimated at from 6,800 to 7,100 ft. above the sea.

At the eastern base of Jebel-Musa, in the ravine of Shouaib, stands in solitary peace the famous monastery of mount Sinai; but in earlier times the mountain had numerous other convents, chapels, and hermitages.

SINAITIC CODEX, a very valuable biblical manuscript, discovered in 1859 by Tischendorf in the convent on mount Sinai, and presented by the monks to the Russian emperor Alexander II. A part of it had been consumed in lighting fires, but there still remained 380 leaves, containing a large part of the Septuagint version of the Old Testament with the Apocrypha, and the whole of the Greek New Testament, with the epistle of Barnabas and a part of the Shepherd of Hermas. The leaves are vellum of exquisite fineness and largest size; the writing is in beautiful and simply formed uncial letters, arranged in 4 columns on each page. There are several decisive marks of great antiquity: 1. The little punctuation which it contains is in the oldest manner. 2. Its peculiarities of spelling and etymology belong to the 4th century. 3. It closely resembles the papyrus manuscripts. 4. The order in which it arranges the books of Scripture is known to have been used at the end of the 3rd century. 5. The division of "larger chapters," universal in manuscripts from the 5th c. downward, is wanting in the Vatican and Sinaitic only. The presence of the "Ammonian sections" and "Eusebian canons" is against an earlier date than the first half of the 4th c.; but as these are written on the margin, and in red ink, they may have been added by a later hand. 6. Its readings correspond with those defended by Origen and with some approved by Eusebius. These criteria and the beauty of the manuscript suggest the possibility that it is one of the 50 copies of the Scriptures which Eusebius, by Constantine's command, had prepared on the choicest skins by skillful writers for churches built to commemorate the emperor's conversion. Whether this be true or not, the manuscript certainly belongs to the 4th c., and probably to the first half of it. Tischendorf pronounces it to be of the same age with the Vatican manuscript. Notwithstanding the beautiful writing of the copyist, he did not always copy correctly. His work also has been subjected to many alterations by various revisers, some contemporaneous with himself, some belonging to the 6th or 7th c., and a few to the 12th. In many places even Tischendorf's skill could scarcely trace the original writing under the alteration. As to disputed readings, it omits the last 12 verses of Mark's gospel; John vii. 53-viii. 11; *at Ephesus*, in Eph. i. 1; and the doxology in Matthew's record of the Lord's prayer; has the reading "church of God," Acts xx. 28; "*who* was manifest," not "*God* was manifest," 1 Tim. iii. 16; and *God* instead of *son*, John i. 18. The emperor of Russia celebrated the 1000th anniversary of his empire by publishing a splendid edition of this manuscript, of which only 300 copies were printed, 200 being given away, and the others sold by Tischendorf. Several colleges and public libraries in the United States have obtained copies.

SINALOA, or **CINALOA**, a state in n.w. Mexico, bounded on the n. by Sonora, on the e. by Chihuahua, on the s. by Jalisco, and on the w. by the gulf of Mexico and the Pacific ocean; drained by the Culiacan, Cañas, Fuerte, and Sinaloa rivers, intersected by a branch of the Sierra Madre mountains; about 26,000 sq. m.; pop. '69, 163,695. The surface is mountainous in the e., with gradually sloping plains in the west. Gold and silver mines are worked, and iron, lead, copper, and other minerals are found. The climate is hot and unhealthy. The soil is fertile. The principal productions are rice, sugar cane, coffee, and fruits. Mazatlan is the most important sea-port. Capital, Culiacan.

SINAPIS. See MUSTARD.

SINCERE BRETHREN, OR **TRUE FRIENDS**, is the name of a semi-religious, semi-scientific Mohammedan order, the beginnings of which are shrouded in obscurity, but which, about 970 A.D., manifested its existence by one of the holdest and most comprehensive literary undertakings—viz., an encyclopædic treatment of philosophy, theology, science, ethics, and metaphysics, in a series of no less than fifty-one treatises. Under the head of **MOHAMMEDAN SECTS**, and more especially under **MOTAZILITES**, mention has been made of that immense religious struggle that arose but a few generations after Mohammed, in the bosom of Islam, bringing forth sect after sect; and which, under whatever name and war-cry, simply denoted the reaction of the thinking minds against the dead-weight of dogmas and formulas, such as the successors of the prophet tried in his name, and often enough in direct contradiction to his explicit dicta, to impose upon the faithful. What the Motazilites had attempted was the reconciliation of scientific speculation, as it had irresistibly grown up at the first contact of the Arabs with Greek literature, with the religious dogma of Islam. This new period of development of Arabic culture, which chiefly characterizes the epoch of the first Abbaside rulers, however, was of no long duration. The representatives of the "orthodox" schools, who would not hear of reconciliation, but insisted all the more uncompromisingly upon the most literal interpretation, dexterously used against them those same weapons of dialectics which their adversaries themselves had first taught them how to wield. Setting to work with proper systems and methods, they soon built up a scholastic edifice of theology, not easy to be attacked without the most direct outspokenness; and from this the new schools, the terror of the caliphate strong upon them, shrank. It was thus that the Motazilites soon disappeared from the arena. But their labors had not been in vain. Silently and by small degrees this new and mysterious union of the Sincere Brethren arose. Though widely spread, their schools, their houses of assembly, their rules, their doctrines—everything remained, for we do not know how long, a profound mystery; and apart from that which they themselves have thought fit to reveal of it, neither ancient nor modern investigation has been able to discover many traces of their inner organization and activity. Not even many of their names have come down to us, though the "treatises" they have left point to a multitude of authors, and to many stages of development. The tone of these treatises is much more free, and their entire tendency more radical than that of any of the books of their predecessors. Yet, the desire not to offend the less advanced in religious matters, and above all to reunite rather than to make the breach wider, is perceptible in their endeavor to use what Koranic quotations and traditions can be pressed into the service of free thought, by often very unnatural processes of allegory and mysticism.

Before speaking of the treatises themselves, we shall briefly summarize what can be gathered as to the mutual relations of the brethren of this secret lodge, and the aims of their association. There is special mention made of the "secret doctrine" which the Brethren should communicate to each other in their houses of assembly at those "stated periods," at which no stranger was to be admitted on any condition. The principal subjects toward which their conservation was to be directed were to be the knowledge of the soul or psychology, the knowledge of the action of the senses and the things perceptible through them, the contemplation and investigation of the mysteries of the sacred books, of the prophetic revelations, and the ideas contained in the divine laws. Their attention was further to be directed toward the four "mathematical" sciences—arithmetic, geometry, astronomy, and (musical) composition. But the chief subject of their investigations should be the knowledge of divine things, which are the end and aim of all study. The most catholic spirit was to prevail among them with regard to the various sciences, systems, or books; since "our own system comprises all, without exception, and includes all science." "The speculations of our school extend simply to all things—the sensual and the intellectual—from the moment of their beginning to their end, according to their outer and inner life—that which is palpable and clear about them, and that which is hidden and secret—the truth, in fact. For the true essence in everything is derived from one primeval origin and general cause, since there is but one world and one supreme mind, to which all the most manifold phenomena, species and kinds, and divisions, are to be traced back." With these words, the encyclopædic tendency of the lodge and their essays is best characterized.

All their knowledge they traced back to four sources—as indeed this number seems to have played a very considerable part in all their divisions—as follows: 1. "The books that are known by the names of the sages and philosophers, in as far as they belong to mathematics and natural history." They do not indicate them further; but it is easy to see from the treatises themselves that they allude to the translations of Greek works bearing the names of Pythagoras, Aristotle, Euclid, Ptolemy, Porphyry, etc. 2. "The revealed writings derived from the prophets," such as the five Books of Moses, the Gospel, the Psalms, the Koran, and other writings of prophets who had received their contents through inspiration by the angels and the "deep mysteries hidden in these books." 3. "Books treating of nature"—i.e., that describe and represent the things now in existence—the celestial circles, the motions of the stars, the transformation of matter, the individual species and kinds of animals, plants, etc. All these things point to abstract

ideas and subtle mysteries of which men in general saw but the outside, ignoring the mysterious art and meaning of the Creator hidden within. But if in this third division of the sources, the power of the mysterious and of spiritualism must needs have become very strong, it seems to have ruled absolute in that most mysterious and obscure of all sources, the fourth—viz., "the divine books, or the books on the divine things, written by the angels from the tablet of fate, upon which all the divine decrees regarding the world and man are inscribed. These contain all that refers to substances, species, kinds, and orders of the different souls; their actions, destinies, metamorphoses, phase after phase, the heavenly conjunctures and periods, etc. For this the Koran was quoted: "And upon the Arap" [the division between heaven and hell] "there will stand men, who will recognize every one by their distinguishing mark." These men, however, are souls who take a higher degree than other men, like the prophets and martyrs, or the elect among the believers and learned, or the angels who appear in human shape." And that there might be no mistake as to the members of the secret brotherhood being alluded to in this passage, another passage from the same sacred volume is adduced, which reads: These are the men who live in houses which God has permitted to be erected, that His name might be praised therein, in which men proclaim his praise both morning and evening, whom even neither commerce nor trade intercourse keeps from the remembrance of God and the solemn fulfillment of the duty of prayer. "This is the state of our brothers, the highly meritorious, the highly honored."

The supreme (outward) duty of the brethren was to support one another in case of need. Men are divided into four classes—those who have wealth without knowledge; those who have knowledge without wealth; those who have both; and those who have neither. And this at once points to the necessity of mutual support. Envy and ill-will are seriously reprobated, and here the ethical portions of the Koran and the Sunnah are appealed to. But these fundamental principles are further explained and detailed in the rules almost step by step; and it is shown how each of the four classes named is to make its support of the Brethren more effective. Everything should be directed for the benefit of the soul, not of the body; everything for the future, nothing for this world. Moral qualities are the highest gift of heaven, and the characteristic sign of the angels and the blessed in paradise—a wise and happy way of comforting the poor of the community, who, by moral purity, may lift themselves to the same purity as the best and richest among the Brethren. In order further to prove how the soul is capable of the highest perfection by degrees, the various ages and stages of man are enumerated, and the gradual progression of all faculties is dwelt upon according to the "strength of the soul." The fourth degree is characterized as the angelic quality of the soul, which is obtained at fifty, and which prepares the way to everlasting life, and to the full separation from matter. To this succeeds the "power of ascension," whereby the member mounts up into the world of the spiritual heavenly beings, so that he foresees clearly the "things of the end," such as the resurrection, the last judgment, the dispersion, the meting out of rewards and punishments; how, further, "the path is to be crossed, how he escapes the fire, enters Paradise, and becomes a denizen of the highest realms with the Father of all mercies." And for this consummation, many passages in the Koran and the Gospel are adduced—no less than the words of Socrates on the day of his taking the hemlock; of Pythagoras at the end of his Golden Epistle, etc.

The encyclopædia of treatises which this secret association has left as the monument of its existence was first compiled at Basrah about 1000 A.D.; but has (save one often reproduced chapter, called "The Contest between Man and Animal") never been printed. The 51 treatises are divided into four classes: 1, the "mathematical," in 13 dissertations or treatises; 2, the "physical," in 17; 3, the "origins" of mental activity, or the thinking soul, in 10; and 4th and last, "the divine law," in 11 treatises, the last of which contains a general outline of the whole work.

The interest attaching to this production, as the earliest encyclopædia deserving the name, reflecting, as it does, the state of science both of the east and west at the end of the first thousand years after the introduction of Christianity, is so great that we append a sketch of the contents and method.

The first 13 treatises, belonging to what may be called the mathematico-philosophical division, treat of arithmetic, geometry, astronomy, geography, music, followed by psychological and ethical reflections. This part concludes with introductions to philosophy and logic. Throughout, the authors only treat of the theoretical part of their subject, without entering into further details as to their practical side, or teaching them systematically one by one.

From these preliminaries the work proceeds to its second part, the physical division, which comprises the whole cosmos in its special phenomena, and the laws that govern them: heaven and earth, the three natural kingdoms, the mysterious union of body and soul, how the latter pervades the former, and communicates itself to all its parts; the changes of life and death, joy and mourning, the senses, and all that is perceptible through them—all the great questions, in fact, which most vitally engage man's attention in this world of growth and decay. An attempt is made to ascertain how far human understanding can penetrate these dim regions of speculation and metaphysics, and even the languages and their original elements are drawn into the circle of these investigations, and subjected to philosophical scrutiny.

The third division treats of the origins of mental activity. Heterogeneous though some of its elements be, it yet keeps its subject sufficiently in view throughout. The elements of mental activity are investigated first according to Pythagoras, then according to the brethren themselves. Next comes man both as microcosm and macrocosm. The revolutions of the heavenly bodies, love, resurrection, the world to come, motion, cause and effect, dogmas, and customs, are then treated of; each and all contributing their share to the aimed-at outward union between reason and faith.

The fourth division borders very closely on the supernaturalistic and purely speculative. At the same time it touches vital doctrines of Islam, and treats them in an abstract and very free manner. How the knowledge of God is gained; the life of the soul after death; the relation of the brethren toward each other; the essence of the true faith; the divine law; prophecy; and the relation of religion generally to the peculiar phase of it as adopted by the lodge; and a number of similar points, are taken up.

So far, in the most general outlines, those 51 treatises, which, though they be neither strictly systematically arranged nor methodized, nor free from repetitions, and by no means so instructive in detail as the enumeration of the contents would lead to believe, yet belong to the most comprehensive and creditable efforts of the human mind.

A small specimen of the manner and method of these treatises, taken from the chapter (20) on plants may not be unacceptable:

"Know that the plants are only perceptible as the visible, palpable phenomena, but that their artistic working within is secret, invisible, and hidden before the eye. It is what we call the part-souls, what the philosophers call the natural powers, what religion calls angels, or divine hosts commissioned with the calling into being and development of the plants and creatures, with the creation of the stones, etc. The terms differ, but the sense and meaning is identical. Philosophers trace these things to the powers of nature; the religious law to the angels, but not directly to the blessed and exalted God. For the blessed God is too exalted to form a natural body himself—to move and to act bodily, just as kings, generals, and high dignitaries are too high to execute any work themselves, though they are considered their authors, through having ordered and willed them. If, e.g., you hear it said that Alexander built Alexandria, you must not, of course, fancy that he himself bodily did build the city—he ordered it to be built. Thus the works of God's servants are traced back to the exalted God, even as the Koran says: 'It is not you who have killed them, but God,'"

One of the most attractive portions of the work, and the one which alone has been repeatedly edited and translated into many languages (not into English), is the so-called "Contest between Man and Animal," which forms a part of the 21st treatise. In this one place alone man and animals are introduced speaking; in all other portions, rhetoric, ornamented by allegories and metaphors, mostly well chosen and artistically wrought, forms the ordinary style. These dissertations may not have fulfilled their purpose any more than did the whole lodge; but they will be all the better appreciated when that darkest period of Mohammedan history, the 10th c., is taken into consideration. Hypocrisy stood for piety at the courts of the many emirs, low cunning for wisdom, the vilest adulation for fidelity, and oppression for justice. No wonder this manly and scientific protest was not received very favorably by so corrupt a generation. Besides which, the want of strict logical arrangement—a circumstance owing probably to the voluntary suppression of the intermediate portion—and the vagueness in which many of the most important points are treated, made even the few independent and faithful minds fail to appreciate it. The chief cause of the discontent which they excited among the contemporaries lay in their conciliatory tendencies. Theology pure and simple would not bear of philosophy. Religion, the orthodox champion said, was a revelation—divinely given, not to be understood even by human intelligence; philosophy, on the other hand, was a vain thing, treating of human things and other futile subjects. The philosophers, though they dared not be quite so outspoken on theology, felt no less keenly that there was no compromise possible under these circumstances, even if they had not repudiated any notion of being "reconciled."

We have treated this subject somewhat more fully than usual, both on account of its deep intrinsic interest, as forming the most striking refutation of the commonplace notion that the religion of Mohammed was a stationary, hard, fanatical, and dotard creed, never questioned or reasoned upon by the faithful; and further, because little or no information on the subject is generally accessible. The work itself has, as we have said, with the exception of the one fairy-tale fragment, never been edited; and there are, even among the authorities on Mohammedan matters, but three or four who have paid special attention to this important subject, and what fragmentary information we possess lies scattered in oriental "transactions," in notes, and in prefaces.—See Sprenger, in *Asiatic Journal of Bengal*; Flügel, in *Deutsche Morgenl. Zeitschrift*; De Sacy, *Notices et Extraits*; Dieterici, *Mensch und Thier*; Nauwerek; etc.

SINCLAIR, FAMILY OF. The Scottish historical house of Sinclair or St. Clair is of Norman descent, the surname (Latinized *De Sancto Claro*) being doubtless derived from possessions in Normandy. Two families bearing this surname, whose connection cannot now be traced, the St. Clairs of Rosslyn and of Herdmanston, appear in Mid-Lothian and East Lothian in the beginning of the 12th century. Henry St. Clair, *vicecomes* of

Richard Morville, chancellor of Scotland, obtained, in 1862, a charter of the lands of Herdmanston, which have ever since continued in the family. His descendant rendered signal service to Robert Bruce, for which he is said to have presented him with a sword, still in the possession of the family, with the words inscribed: "*Le roy me donne, St. Clair me porte.*" The ancestor of the other line was William St. Clair, who had Rosslyn confirmed to him by charter from David I. His descendant was, like his contemporary of the Herdmanston line, a companion-in-arms of Robert I., on whose death sir William St. Clair of Rosslyn was one of the knights selected to accompany the good sir James Douglas, with the heart of his sovereign, to Jerusalem. With the Douglas, he fell in battle against the Moors in 1330. But the fortunes and importance of the family were principally due to the marriage of the son of this sir William with the daughter of Malise, earl of Strathearn, Caithness, and Orkney, and heiress of the Norwegian Jarls of the Orkneys. In this way the St. Clair family acquired the earldom of Orkney, coupled with some very stringent conditions of fealty to the king of Norway, which would have rendered it impossible for him, in the event of a war between the countries, to have retained both his Scotch and his Norse possessions. The Orkney earldom was, however, acknowledged and confirmed to him by Robert II.; and for the next two generations the power of the family continued to be little less than princely, the St. Clair influence being further increased by intermarriages with near relatives of the royal house of Scotland. William, the third earl, held the high offices of lord admiral, lord justice-general, lord chancellor, and lord warden of the three marches. He was made earl of Caithness in 1450. At his castle of Rosslyn he kept up an almost regal state and pomp. He founded and endowed a collegiate church there, bringing skilled workmen from foreign parts to build that rich and elaborate chapel, which is still among the architectural gems of Scotland, and in its style more resembles the churches of Spain than those of north Britain. His daughter was given in marriage to Alexander, duke of Albany, son of James II. On the marriage of James III. with princess Margaret of Denmark the sovereignty of the Orkneys was made over by king Christiern in mortgage to the Scottish crown, a transaction which eventually led to the permanent cession of these islands. The earl soon after resigned into James's hands his earldom of Orkney, with the islands of Orkney and Shetland, and as a compensation—it has been said a very inadequate one—obtained the lands of Dysart and Ravensheugh, and the castle of Ravensraig in Fife. He was still earl of Caithness and lord Sinclair, and from the extent of his possessions one of the most powerful nobles in Scotland. Instead, however, of keeping these possessions united, he partitioned them among his three sons in such a way as contributed far more than the loss of the Orkneys to break down the family influence. On William, his eldest son, he bestowed merely the lands of Newburg, in Aberdeenshire; on his second, sir Oliver, he settled all his estates s. of the Tay; while, with consent of the crown, he conveyed the earldom of Caithness to his youngest son, also named William.

LORDS SINCLAIR.—The eldest son of this last earl of Orkney endeavored to set aside his father's settlement, by which he had been postponed to his younger brothers, and succeeded at last in effecting an arrangement by which sir Oliver made over to him all the Fifeshire estates, while he renounced all claim to Rosslyn, and the other lands in the county of Edinburgh. He was still lord Sinclair, and on his death, on the field of Flodden, he was succeeded by a line of lords Sinclair, who ranked among the more considerable of the Scottish nobility. His grandson, by a daughter, was the notorious earl of Bothwell, third husband of queen Mary, and whom, in memory of his maternal descent, that unhappy queen created duke of Orkney. The seventh lord Sinclair had no male issue, but a daughter, married to St. Clair of Herdmanston, the representative of the other house of Sinclair already alluded to. The son of this marriage, in virtue of a new patent obtained from Charles II., became eighth lord Sinclair—this patent, singularly enough, bringing in, on failure of heirs male, his paternal relatives, the St. Clairs of Herdmanston, strangers in blood to the former lords Sinclair. The contingency provided for occurred in the next generation. The two sons of the eighth lord having died without issue, the title went to the Sinclairs of Herdmanston, who have ever since inherited it.

EARLS OF ROSSLYN.—Rosslyn had been purchased by one of the sons of the eighth lord Sinclair from the last of sir Oliver's line, and while the title thus went to an entirely different line, the estates, both of Rosslyn and Dysart, were carried by destination to the issue of the eighth lord's second daughter, whose grandson, sir James Erskine of Alva, succeeded to the earldom of Rosslyn, which had first been conferred on his maternal uncle, the lord chancellor Loughborough.

SINCLAIRS OF ROSSLYN.—Sir Oliver, the above-mentioned second son of the last earl of Orkney, was progenitor of a line of barons who, for two centuries, owned the splendid domains of Rosslyn, and were buried in the vault of the chapel, in royal fashion, in their armor. Sir Oliver's second son was the noted Oliver Sinclair, the favorite of James V., whom, to the general disgust, he placed in command of the army sent to encounter the English in 1542. To the repugnance of the army to serve under him is attributed the disgraceful rout of Solway Moss, where 10,000 Scottish troops fled at the sight of 300 English cavalry, to whom they can hardly be said to have made any resistance. Among the functions discharged by the Sinclairs of Rosslyn were those of protectors of the gypsy race, and hereditary grand-masters of the masonic fraternity of Scotland. The

last of sir Oliver's line, impoverished by the political troubles in which his support of the Stewarts had involved him, sold Rosslyn, which then became, as has been already seen, the property of the disinherited elder branch.

EARLS OF CAITHNESS.—This title was, as has been seen, conferred on William, the youngest son of the last earl of Orkney, and has been ever since held by his descendants, passing repeatedly from one branch to another on the failure of the direct line. The third earl, ambitious enough to aspire to be an independent prince, endeavored, in 1529, by force of arms, to recover the Orkneys from the crown. He was joined by his cousin, the second lord Sinclair, but this foolish expedition met with a signal defeat. The support of the islanders had been calculated on, but the large majority of them turned out to be steady in their loyalty, and encountered the insurgents in a naval battle, in which the earl with 500 men were slain, and lord Sinclair and the rest made prisoners. The sixth earl, having got into difficulties, conveyed his lands to his powerful creditor, sir John Campbell of Glenurquhay, afterward first earl of Breadalbane, who, in 1677, got a patent creating him earl of Caithness, and took possession of the Caithness estates. He was dispossessed, however, by George Sinclair, the heir male, who entered Caithness with an armed force, and was eventually found to have the sole right to the title and estates. The Sinclairs of Ulbster are sprung from a legitimated son of William Sinclair, second son to the fourth earl of Caithness, to whom the valuable and extensive lands of Ulbster were conveyed in 1596 and 1601 by the fifth earl. See SINCLAIR, SIR JOHN.

A genealogical history of the St. Chairs of Rosslyn, written by father R. A. Hay, was printed privately at Edinburgh in 1835.

SINCLAIR, Sir Joux, an eminent agricultural improver, and patriotic Scottish gentleman, was b. at Thurso castle in 1754. He represented the Sinclairs of Ulbster, a branch of the noble house of Caithness. After a careful education, completed at Oxford, he studied law, and was admitted a member of both the Scottish and English bars, but having, in his 16th year, succeeded to the family estate, he devoted himself to his duties as a northern landlord, and to the more engrossing pursuits of public life. In 1780 he was returned to parliament for his native county, which he represented for many years. He wrote pamphlets on public affairs—on the navy, the militia force, the national finances, etc. In 1784 he published a *History of the Revenue of the British Empire*, an elaborate work in two 4to vols.; and in 1786 he was created a baronet. He traveled over Europe, gathering information on economical and commercial questions, and on his return set about establishing a society in Scotland for improving the breeds of sheep and the quality of wool. His exertions also led to the formation of the board of agriculture in 1793, of which he was president for 13 years. This institution was the precursor of numerous agricultural associations, by which the country was greatly benefited. Sir John's most important undertaking was originating and carrying through the *Statistical Account of Scotland*, completed in the year 1798 in 20 large vols., and comprising a description of every parish in Scotland. The parochial clergy were the chief contributors, but the indefatigable baronet also employed statistical missionaries, and was for seven years actively engaged in prosecuting the work. Sir John wrote on all manner of topics, including even a tragedy and treatises on health and longevity; and his publications during 50 years of ceaseless exertion are said to amount in number to 367! Not one of the whole seems destined to live; their value perished in the using; but the long and active life of their author was highly beneficial to his country. The venerable baronet died at Edinburgh, Dec. 21, 1835, in the 82d year of his age.

Sir John Sinclair left a numerous family, some of whom have attained to distinction. CATHERINE SINCLAIR, fourth daughter of the deceased baronet, was the author of a number of tales and descriptive works—*Modern Accomplishments*, *Modern Society*, *Scotland and the Scotch*, *Scotland and the Shetlanders*, etc., which all evince literary taste and talent, combined with fine moral feeling; while her practical benevolence and social kindness greatly endeared her to her friends, and to Edinburgh society generally. Miss Sinclair died, universally regretted, in 1864, aged 63.

SINDE, an extensive province of British India, lies in the extreme w. of that territory, and is bounded on the n. by Beloochistan and the Punjab, e. by Rajputana, w. by Beloochistan, and s. by the Arabian sea and the Great Western Runn, an extensive lacustrine inlet which separates Sind from Cutch. It is 380 m. in greatest length, 280 in greatest breadth, contains 46,599 (besides a tributary area) English sq. m., with a pop. '72 of 2,192,415. The sea-coast, which extends n.w. for 150 m., is very low and flat, with the sole exception of the small portion beyond Karachi (Kurrachi), and is studded here and there with low mud-banks formed by the Indus, or with sand hills, the accumulated drift from the beach; it is overflowed at high-tide to a considerable distance inland, and is hardly visible, according to Burnes, at a league from shore. The province is traversed through its whole length by the Indus (q.v.), which, on approaching the coast, divides and subdivides into a number of channels, forming a delta of 75 m. in length by 130 in breadth. This delta, unlike that of the Ganges, is almost wholly destitute of wood, and the soil consists of a mixture of clay, sand, and vegetable mold, which is speedily baked hard by the heat. Along each bank of the Indus is an alluvial tract of great fertility, extending 2 to 12 m. from the river, and mostly irrigated by artificial canals and water-courses, which, overflowing during the inundations, cover the soil with

a silt so rich as to yield two, and sometimes three crops in a year. The soil, nevertheless, contains in the n. so much saltpeter, and in the s. so much salt, that after the year's crops have been obtained, these substances are extracted for home consumption and export. Between the Indus and its most easterly branch, the Narra, is an alluvial "doab," averaging 75 m. in width, but which, from want of irrigation, has become almost a desert. East of this, on the other side of the Narra, is the *Thur*, a desert of shifting sand. West of the Indus the country is occupied by the desert of Shikarpur on the n., a desert not of sand, but of alluvial clay, the same as that of the delta, which only requires irrigation to render it fertile; and in the s. it is traversed by the Hala mountains. The *Thur*, or eastern desert, has numerous vestiges of former towns, in the shape of heaps of fragments of bricks and pottery. The climate of Sindh is remarkably sultry and dry, it being completely beyond the action of the s.w. monsoon; at Haidarabad, the fall of rain in one year was 2½ in., and the average annual fall at Karachi does not exceed 6 to 8 in., and Larkhana has been known to be destitute of rain for three years in succession; the average maximum heat for six months at Haidarabad was 98.5° in the shade, and is still greater in upper Sindh. There are generally two harvests per annum; the first, or *rubbi* (spring) harvest, consists of wheat, barley, oil-seeds, millet, durra, opium, hemp, and tobacco; the second, or *kurif* (autumn) harvest, of those crops whose ripening requires much heat, as rice, sugar-cane, cotton, indigo, maize. The population consists of a mixture of Juts (a Hindu race) and Beluchis, with a few Afghans in the n.w.; the greater portion of them are Mohammedans, and the remainder, who profess Hinduism, have fallen far from the strictness of observance which characterizes the most of its followers. Generally, the Sindians are tall and handsome; the Beluchi portion of them warlike and independent; the Juts peaceable, and given to agricultural pursuits.

From the time (711) that Sindh was conquered by the caliph, Abd-ul-Melek, it underwent numerous vicissitudes, forming at times a part of the empire of Delhi, and being latterly (1756) joined to Afghanistan. In 1779 the Beluchis rebelled, deposed their ruler, defeated the Afghans (1786), and raised their leader, the chief of the Talpûr tribe, to supreme power. This chief made large grants of territory to various of his relatives, reserving most of lower Sindh for himself and his three brothers; so that there were four "ameers" at Haidarabad, three at Khyerpûr, and one or two at Mirpur. The ameurs of Sindh always regarded the British government with suspicion, and occasionally troubled those traders who visited their dominions; but they subsequently concluded commercial treaties, which were observed with punctuality. On the outbreak of the Afghan war in 1838, the British government intimated its intention to take temporary possession of Shikarpûr, and forced the ameurs of Haidarabad and Mirpur to agree to a treaty which virtually destroyed their independence. Their expression of a natural dislike at the mode in which they had been treated, provoked fresh demands from the Calcutta government, to which the Haidarabad ameurs agreed, despite the clamors and threats of their followers, who attacked the British residency on the following day. Sir Charles James Napier, the British envoy, at the head of a considerable military force, then marched against the enemy, totally routed them at Meeanee (Feb. 17, 1843), and by defeating the ameurs of Mirpur, at Dubba, near Haidarabad (Mar. 24), completed the subjugation of Sindh. The conquered territory was divided into three collectorates—Haidarabad, Karachi, and Shikarpûr; the ameer of Khyerpûr, by continuing faithful to the British, retaining his dominions. For two years afterward, Napier was actively employed in reducing the marauding tribes of the west, who pillaged the province; and so successful was the "*Sheitanka bhai*" (devil's brother), as the robber tribes named him, that they were completely rooted out of their fastnesses, and most of them transported to distant regions. The country is reported as rapidly improving under its present administration.

SINDHU (from the Sanskrit *syand*, which in its older form probably was *syandh*, to trickle or flow) is the ancient name of the river Indus and the country along the Indus or Sindh.

SINDIA, the name of a powerful family of Mahratta chiefs and princes, which occupies a conspicuous place in the history of India during the 18th and 19th centuries. The founder of the family was RAOJEE SINDIA, a sudra of the Kûmbi ("cultivator") tribe, who from a menial station in the household of the peishwa, rose to a high rank in the body-guard, and after 1743 received in hereditary fief the half of the extensive province of Malwa. His son, MADHAJEE SINDIA (1750-94), joined the Mahratta confederation, and was present at the battle of Paniput (1761), where he was so desperately injured as to be left for dead, but he speedily recovered, and, on the retirement of the Afghans and their allies, repossessed himself of his hereditary dominions. On the death of Mulhar Rao Holkar (q.v.) he became the chief of the Mahratta princes, and had the command of the peishwa's body-guard; and in 1770, the peishwa and his two powerful feudatories, Sindia and Holkar, aided the emperor of Delhi in expelling the Sikhs from his territories, of which the administration was handed over to Sindia, who was now by far the most powerful of the Mahratta chiefs. The murder of the young peishwa by his uncle, Ragoba, and the consequent expulsion of the murderer from the throne he had seized, brought Sindia for the first time into collision with the British, who had espoused Ragoba's cause; but in the war (1779-82) which followed, fortune distributed her favors

with impartiality, and by the treaty of Salbye (1782) Sindia was recognized as a sovereign prince, and confirmed in all his possessions. In 1784 he captured the stronghold of Gwalior, and in the following year marched on Delhi, to restore his preponderance in the councils of the puppet monarch, and subsequently seized Agra, Allyghur, and nearly the whole of the Doab (q.v.). The manifold advantages of European discipline had struck him forcibly during the war with the British, and, with the aid of an able French officer, he introduced it into his own army. An army of 18,000 regular and 6,000 irregular infantry, 2,000 irregular and 600 Persian horse, with 200 cannon, was accordingly raised, and under the leadership of De Boigne, the officer above noticed, reduced Joudpore, Odeypore, and Jypore, three Rajpūt states, and effectually humbled the pride of Holkar. —DOWLET RAO SINDIA (1794–1827) continued his grand-uncle's policy, and during the troubles which convulsed Holkar's dominions at the commencement of the 19th c., he ravaged Indore and Poona, but was wholly routed in 1802 by Jeswunt Rao Holkar. Having joined Bhonsla, the rajah of Berar, in a raid on the nizām (1803), he brought down upon himself the vengeance of the East India company. The confederated Mahrattas were routed at Assaye and Argum by sir Arthur Wellesley; Sindia's disciplined troops, under the command of French officers, were scattered irretrievably at Patpargunge (near Delhi) and Laswari by lord Lake, and he only escaped total ruin by acceding to a treaty by which all his possessions in the Doab and along the right bank of the Jumna were ceded to the British. Gwalior was, however, restored in 1805, and from this time became the capital of Sindia's dominions. Sindia had been taught by his reverses a useful lesson, and he declined to join Holkar, the peishwa, and Bhonsla, in their attack (1817) on the British, and thus escaped the swift destruction which was visited upon his turbulent neighbors. During the reign of BIAGERUT RAO SINDIA, a minor, the Gwalior dominions were in such a state of anarchy, that the British were compelled to insist on certain guarantees for the preservation of tranquillity; and on these being rejected, a war followed, and the Mahrattas were routed at Maharajpūr (Dec. 29, 1843) by lord Gough, and at Puniaur by maj.gen. Grey on the same day. Gwalior fell into the hands of the British, Jan. 4, 1844, and Sindia submitted to the conditions demanded of him, besides maintaining a contingent force of spoys at Gwalior. In 1853 he was declared of age by the East India company, and in 1858 he took the field at the head of his own army against the Gwalior contingent, which had joined in the great sepoy mutiny. But the most of his troops deserted him during the battle (June 1), and he narrowly escaped by fleeing to Agra. Sindia was subsequently reinstated by sir Hugh Rose, and received from the British government numerous testimonials of its grateful respect. He is a knight grand cross of the order of the bath.

SINECURE (Lat. *sine cura*, without care), in common language, an office which has revenue without employment. In the canon law, a sinecure is an ecclesiastical benefice, such as a chaplaincy, canonry, or chantry, to which no spiritual function is attached, except reading prayers and singing, and where residence is not required. The strictest kind of sinecure is where the benefice is a donative, and is conferred by the patron expressly without cure of souls, the cure either not existing, or being committed to a vicar. Sinecure rectories were abolished by 3 and 4 Vict. c. 113, s. 48.

SINEW. See TENDON.

SIN-GAN-FOO, a city of China, province of Shen-See, on the right bank of an affluent of the Hoang-ho. It was formerly the capital of the empire; pop. about 150,000. It is large, inclosed by walls, and is the chief military depot for the northern province of China. A Syrian inscription has been found here recording the introduction of Christianity by the Nestorians in the 4th century.

SINGAPORE, one of the Straits settlements (q.v.), belonging to Great Britain, consists of an island lying off the s. extremity of the peninsula of Malacca, in lat. about 1° 17' n., long. 103° 50' e., and having a city of the same name on its s. side. The island is 25 m. long, and from 14 to 15 broad; area, 224 sq. miles. It is separated from the main-land by a narrow but deep strait, varying from a mile to a few furlongs in width. The surface is generally low and undulating, the greatest elevation (Bukit Timar, or the Hill of Tin) being only 520 feet. According to Malay accounts, a colony was planted on the site of the present town by tribes who are inferred to have been Javanese, from the circumstance that the name Singapura, which they gave to their settlement, is most probably of Sanskrit origin (lion-town); the Javanese being the only people in these seas who have become fairly Hinduized. Be that as it may, in 1818 it was found by sir Stamford Raffles to be an island covered with primeval forests, sheltering in its creeks and rivers only a few miserable fishermen and pirates. It seems to have been unclaimed by any power until 1811, when the sultan of Johore formally annexed it to his territories. The commanding position of Singapore, in the very center of the highway leading from British India to China, led sir Stamford Raffles to mark it out as the site of the first free port in the Malayan seas; and in 1819 the British flag was hoisted on the new settlement; although it was not till 1824 that Mr. Crawford concluded a satisfactory treaty with the sultan of Johore, whereby the island of Singapore, and all the islands within 10 m. of its shore, were given up in full sovereignty to the East India company, on condition of a considerable yearly payment. Since then the prosperity of Singapore has been almost without a parallel. Its position as an entrepôt for the trade of the Malayan archipelago,

the Eastern Peninsula and China, and the wise policy that placed the commerce of the new port on an entirely unfettered footing, rapidly established a flourishing trade. In 1823 the imports amounted to £1,200,000; the exports to £920,000. In the year ending April 30, 1865, the value of the imports was £6,610,000; the exports, £6,630,000, being fully double the amounts in 1854-55. Notwithstanding the opening up of more direct communications with Europe of many of the markets in China, Cochin-China, and Siam, formerly largely supplied by traders from Singapore, the commerce has increased, and in 1872 the value of imports was £8,600,000, and of exports, £7,800,000. The following table shows, in dollars, the value of the import and export trade of Singapore in the years 1875-76:

	Imports.	Exports.
In 1875—		
United Kingdom.....	8,669,518	6,658,236
British colonies and coasting.....	15,373,924	9,791,975
Foreign countries....	19,722,759	25,169,308
	43,766,201	41,619,519
In 1876—		
United Kingdom.....	10,252,334	6,719,787
British colonies and coasting.....	17,055,094	8,991,175
Foreign countries.....	18,158,642	24,903,821
	45,466,070	40,614,783

The chief articles of export to Europe and North America are gambir, tin, sago, tapioca, black and white pepper, tortoise-shell, nutmegs, gutta percha, camphor, coffee, sapan-wood, and ratans. Of these, only gambir, sago, and nutmegs are produced on the island to any important extent; all the other articles being imported, chiefly by natives, from other quarters. From Europe large imports are received of cotton manufactures, woollens and linen, metals, hardware, earthenware, arms and ammunition, and treasure in the form of dollars. Large fleets of prahus are wafted by the southerly monsoon toward this great center of trade, laden with the numerous products of the Indian archipelago, to return again laden with the manufactures of Europe. In 1875, 2,261 vessel, of 1,283,786 tons, entered at Singapore, while 2,348, of 1,003,601 tons, cleared—besides 3,171 coasting craft entered and 3,462 cleared. In 1876, 2,149 vessels, of 1,454,689 tons, entered the port; and 2,182, of 1,428,992 tons, cleared; the coasting trade being 3,716 entered and 3,718 cleared. In 1875 the local revenue of Singapore was \$136,686, the expenditure being \$136,256. In 1876 the figures were—revenue, \$170,178; expenditure, \$174,361. Education is being steadily advanced in Singapore, and a zealous desire on the part of the Eurasians to learn English is now observable. One school in Singapore had, in 1876, an attendance of 476. It is intended to establish at Singapore a training school for vernacular teachers. There is already a Malay college.

The currency of commerce is the Spanish dollar; but the official currency of government is the rupee. The Chinese peck, of 133½ lbs. avoirdupois, which is divided into 100 catties, is the standard of weight. The population of Singapore is perhaps the most heterogeneous in the world, comprising at least 16 nationalities, speaking different tongues. The Malay, however, soft and easily acquired, is the recognized medium of communication between all classes. The population, which is increasing, amounted in 1871 to 97,111, of whom 61,752 were in the town of Singapore and its environs, 31,235 in the country, and 4,124 on board of vessels. According to the census report for that year, the various races stand to each other in the following proportion: Europeans and Americans, 1946; Chinese, upward of 54,600; Eurasians, Armenians, and Jews, 2,285; Malays, and Klings or immigrants from southern India, 37,000. Of the aboriginal inhabitants of the island, not a trace remains; but similar tribes are still to be found in small numbers in several parts of the peninsula. Of the native population, the Chinese are the most useful part; they form almost the only body of trustworthy native merchants, in the proper sense of the word, and are freely trusted to large amounts by European importers; and it may be doubted whether, as a commercial body, they are, on the whole, more deficient in morality than many European communities. The laws are those of Great Britain, with some modifications; the court is that of a recorder. Singapore being a free port, the revenue is raised by inland excises on opium and spirits. Singapore is the seat of government for the Straits settlements (q.v.), which, on April 1, 1897, were transferred from the control of the Indian government to that of the secretary of state for the colonies.

The town of Singapore, which, as we have seen, contains two-thirds of the whole population of the settlement, is situated at the mouth of a small river, on the Singapore side of the island. It is the seat of government for the whole of the Straits settlements. Its appearance is of a mixed oriental and European character; the streets are generally wide, and kept in good order, and in 1864 the town was lighted with gas. There is an efficient police, and the sanitary arrangements of the town are good. The municipal council consists of public officers and ratepayers.

Singapore possesses two fine harbors; one opposite the town, which, although little more than an open roadstead, is a safe and convenient anchorage, where ships load and discharge by means of lighters; the other is about 3 m. w. of the town, and is land-

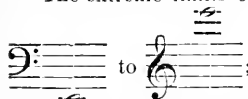

locked, and capable of admitting the largest vessels. Along its shores, extensive wharves have been erected by steam companies and individual merchants; and it is probable that when communication by railway with the town is established, the old harbor will be little used. There are several fortifications commanding the harbor and roads, but the increasing commercial and political importance of the place calls for a still stronger naval and military station. Singapore being within 80 m. of the equator, has little or no variety of seasons; the climate, although hot, is healthy; the temperature ranges from 71° to 92°; rain falls more or less on 200 days of the year, and the extent of the fall is about 87 inches. The soil of Singapore is not fertile, although the climate is such as to cover it with a rich and beautiful vegetation. The nutmeg was at one time successfully cultivated, but most of the trees having unaccountably died, this has been abandoned, and husbandry is now confined to the cultivation of the cocoa-nut, the pepper-vine, and gambir plant, and to the raising of sugar-cane and vegetables for local consumption. The curse of Singapore is the tiger. It is estimated that 300 Chinamen and other natives are carried off yearly. Turtle are abundant on the shores, and form the cheapest animal food in the bazaars.—See Thomson's *Journal of the Indian Archipelago*; J. Crawford's *Dictionary of the Indian Islands and Adjacent Countries*; J. Cameron's *Our Tropical Possessions in Malayan India*.

SINGHALESE LANGUAGE. See CEYLON, *ante*.

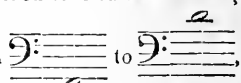

SINGHARA NUT. See TRAPA.

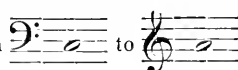

SINGING, the art of producing music from the human voice, generally, though not necessarily, combined with speech. The mechanism of the vocal organs, as applicable to singing, has by some physiologists been likened to a reed, by others to a stringed instrument, in point of fact, the human voice is produced by an apparatus far beyond either in complexity of structure.

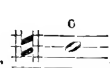

The extreme limits of the voice in respect of pitch may be considered to be from

; but the compass of any individual voice is limited to a portion

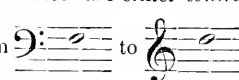

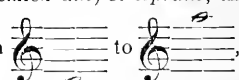

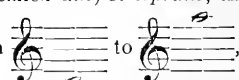

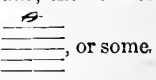

of that range, and voices are classified according to their pitch. Generally speaking, male voices lie an octave below female. The former are divided into *bass* and *tenor*,

the compass of ordinary bass voices being considered to be from ,

and of tenor from . For tenor music, the tenor or C clef is

generally used, , which has the advantage of having the principal tones within

the staff. When the treble clef is used, the music is written an octave above its true pitch. Female voices are either *contralto* (otherwise called *alto*) or *soprano*, the former

extending from  to , the latter from  to , or some

times higher. Contralto music may be noted either on the treble clef, or on the alto clef, which latter is but the tenor clef placed on the third instead of the fourth line of

the staff . These are the principal divisions of voices; but there are also

further subdivisions. Intermediate between bass and tenor is another male voice, called *baryton*; and intermediate between contralto and soprano, another female voice, called *mezzo soprano*. The ordinary compass of a voice is about twelve notes, but two octaves are not uncommon, and some voices have reached three. Madame Catalani is said to have possessed a voice of three and a half octaves compass.

The notes produced in singing are of two kinds, according as they proceed from the chest voice (*roce di petto*), or head voice (*roce di testa*). The chest notes, or lower register, proceed naturally and readily from the ordinary mechanism of the voice; the upper register, head voice, or falsetto, is produced by a more or less forced contraction of the cavity from which the voice proceeds, imparting to the notes a life-like character, gentle and weak in the male voice, but often clear and sonorous in the female. It is only in the higher notes of the voice that the falsetto is used, and some notes on the borders of the two registers may be given in either. Where the two registers meet, the tones are apt to be hard and uncertain, or weak; but a cultivated singer will blend the head and chest voice at the point of junction, so as to make the break imperceptible. The notes

of the bass voice are given entirely from the chest. In the tenor, the three or four upper notes belong mostly to head voice. The contralto tones are mostly chest voice, and the upper tones of the soprano are head voice. The alto, when sung, as it often is in England, by male voices, is principally falsetto.

In singing, the head should be held erect, and the chest well expanded, to allow free play to the lungs and free emission of the voice from the throat. The tongue should be kept still, slightly pressing on the lower teeth. Proper regulation of the breath, and proper articulation of the words, are also matters of essential moment.

One particular requires to be mentioned, in which the notation of songs differs from that of instrumental music. In the latter, two or more quavers or semiquavers may be grouped together by a common line; in singing, this can only be done when the whole group are to be sung to one syllable, and notes belonging to different syllables are always written separately. When notes without hooks, or notes that are not grouped, belong to one syllable, they are bound together by a *slur* placed over them, e.g.:

Among the principal objects to be studied in cultivating the voice for singing are the improvement of its quality in respect of clearness and resources; the rendering every note in its compass equally pure; the extension of its compass, not by injudicious forcing, but by gradual practice; and the acquirement of the power to prolong any note with perfect ease. See MUSIC, VOICE, SOLFEGGIO.

SING SING, a village in Westchester co., N. Y., in Ossining township, on the e. bank of the Hudson river, 32 m. n. of New York, on the Hudson River railroad; pop. 6,500. It has 7 churches, a national bank, 4 military boarding schools, the Mt. Pleasant academy, a seminary for young ladies, and 3 weekly newspapers. The village contains a large stove-foundry, a water-pipe foundry, manufactures of hats, cotton-gins, files, lime, and shoes, and a book-bindery. The Croton aqueduct passes through Sing Sing, and is carried over a ravine by a stone arch of 88 ft. span and nearly 70 ft. above the stream. Many private residences are beautifully placed on a long upward slope, and the streets rising above each other from 200 to 300 ft. afford a splendid view of the Hudson river, whose expansion at this point is called Tappan Zee or bay, 3 m. wide. The Sing Sing state prison (one of the three in N. Y.) was founded about 1826. The buildings were erected by felons from the Auburn prison, and cover 130 acres of ground, three-quarters of a mile s. of the village. The main prison is 484 ft. long, and has 1,200 cells, with an iron-foundry, and manufactories of saddles, shoes, furniture, etc. The prison for women has 108 cells, and the prisoners are employed in making clothing.

SINGULAR SUCCESSOR, in the law of Scotland, means one who succeeds in the ownership of property by purchase or any other mode than by descent.

SINIGAGLIA, or SINIGALLIA (anc. *Sena-Gallia*), a city and sea-port on the e. coast of Italy, in the province of Ancona, and 17 m. w.n.w. of the city of that name, at the mouth of the Misa, with 10,500 inhabitants. It is a bright, cheerful city, built after the modern style, walled round, and it has bastions and handsome gates. Sinigaglia is celebrated for its annual fair, which lasts from July 20 to Aug. 10, and which sometimes puts in circulation about 60 million francs in 20 days. English, French, Swiss, Americans, Germans, etc., attend it. Sinigaglia was founded by the Senonian Gauls, and colonized by the Romans 289 B.C.

SINISTER, in heraldry, the left-hand side of a shield. As shields are supposed to be carried in front of the person, the sinister side is that which covers the bearer's left side, and therefore lies to the spectator's right. See POINTS OF ESCUTCHEON.

SINKING FUND. See FUND.

SINOPE (Turk. *Sinub*), a t. of Asiatic Turkey, province of Anatolia, on the southern side of a little promontory running eastward into the Black sea, 80 m. n.w. of Samsun. Sinope, which is defended by some half-ruined fortifications, possesses a dock-yard and naval arsenal; exports timber, dried fruits, tobacco, bay-leaves, and oil, and has a population of from 8,000 to 10,000 souls. The bay of Sinope, which affords the finest anchorage for ships along the whole northern coast of Asiatic Turkey, was the scene of a bloody naval engagement, or rather massacre, Nov. 30, 1853, when a Turkish squadron of 13 ships was suddenly attacked and destroyed by the Russian fleet.—Of the ancient city of Sinope, which was founded by a colony of Milesian Greeks, and, for 200 years

after the Peloponnesian war, was almost the mistress of the Euxine, numerous ruins still exist, "friezes, hundreds of Corinthian columns, capitals, sculptures, inscriptions, and even statues, built up into the walls of its picturesque Byzantine fortifications." Sinope was the birthplace of Diogenes the cynic.

SINOPE, in heraldry (q.v.), the same as vert.

SINTER, the name given by German mineralogists to those rocks which are precipitated in a crystalline form from mineral waters. They are of recent date, belonging in fact to the strata at present in course of formation. Sinter is of various forms, kidney-shaped, knotted, tuberous, botryoidal, tubular, stalactitic, shrub-like, or pronged, and is occasionally distinguished by its chief component, as calcareous sinter, flint or quartz sinter, iron sinter, etc. Calcareous sinter, which is a variety of carbonate of lime, composed of concentric plane parallel layers, appears under various forms; it is deposited with extraordinary rapidity by many springs, a peculiarity frequently made use of to obtain the incrustation of objects with a coating of this substance. Quartz sinter is mostly found in intermittent hot springs, as in the Geysers (q.v.) of Iceland. Iron sinter occurs in old mines, and in coal-beds, where it is formed from iron pyrites through the agency of the atmosphere. The tubular conglomeration of grains of sand half-melted by lightning (*blitz*) is also known as *blitz-sinter*, or *fulgurite* (q.v.).

SINUS (Lat. a bend or hollow) has two significations in anatomy, and one in surgery. The cells or cavities contained in certain bones—as the frontal, ethmoid, sphenoid, and superior maxillary—receive this designation. The frontal sinuses are two irregular cavities extending upward and onward, from their openings on each side of the nasal spine, between the inner and outer layers of the skull, and separated from one another by a thin bony septum. They give rise to the prominences above the root of the nose called the nasal eminences. They are not developed till after puberty, and vary considerably in size, being usually larger in men than in women and young persons, in consequence of the greater prominence of the superciliary ridges in the former. When very much developed they give a receding appearance to the forehead. They are larger in Europeans than in negroes, and are very imperfectly developed in the Australians, whose peculiar want of vocal resonance is apparently due to this deficiency. They communicate on each side with the upper part of the nostril by a funnel-shaped opening, which transmits a prolongation of mucus membrane to line their interior. These cells are much more highly developed in certain mammals and birds than in man. Prof. Owen observes that "they extend backward over the top of the skull in the ruminant and some other quadrupeds, and penetrate the cores of the horns in oxen, sheep, and a few antelopes. The most remarkable development of air-cells in the mammalian class is presented by the elephant; the intellectual physiognomy of this huge quadruped being caused, as in the owl, not by the actual capacity of the brain-case, but by the enormous extent of the pneumatic cellular structure between the outer and inner plates of the skull." The sphenoidal sinuses are two large irregular cavities, formed, after the period of childhood, in the body of the sphenoid bone. They communicate with the upper part of the nose, from which they receive a layer of mucus membrane. Like the frontal sinuses, they serve to lessen the weight of the skull, and to add to the resonance of the voice. The ethmoid sinuses or cells lie in the lateral masses of the ethmoid bone. They open into the cavities of the nose. Their main use is to diminish the weight of the forepart of the skull. The superior maxillary sinus commonly known as the *antrum of Highmore* (the anatomist who first accurately described it) is the largest of the facial sinuses. Its uses are the same as those of the others, and, like them, it communicates with the nasal cavities.

The *sinuses of the dura mater* are quite distinct from the above described bony sinuses; they are irregular channels for the transmission of venous blood, and are formed in the following way: the dura mater consists of two layers—an outer, belonging to the skull; and an inner, belonging to the brain. They can be easily separated in infancy, but in the adult they are blended together for the greater part of their extent. In some places, however, as beneath the sagittal suture (formed by the two parietal bones at the top of the head, and running from before backward), they are separated on either side of the mesial line, the outer layer being continued beneath the bone, and in contact with it; while the inner one dips inward, and meeting with the corresponding layer of the opposite side, forms a triangular canal or sinus, which is strengthened at the sides and angles by interlacing bands of fibrous tissue. The sinus whose formation we have thus described is called the superior longitudinal sinus, and the other sinuses are formed in the same way. They are all lodged in the intervals between the great divisions of the brain, and they are so constructed "that their shape cannot easily be altered by any external pressure; consequently, the flow of blood through them cannot be impeded by the pulsations or pressure of the brain, in the varying positions of the body. The tense, unyielding character of their walls, moreover, does not admit of either collapse or distension; hence, they must be equally full at all times, and must exert a uniform pressure on the brain."—Humphrey *On the Human Skeleton*, p. 200.

In surgery the term *sinus* is nearly equivalent to *fistula* (q.v.).

SION, a small t. of Switzerland, capital of the canton of Valais, in a picturesque situation on the right bank of the Rhone, 18 m. n.e. of Martigny by the Simplon railway.

It is defended by walls, towers, and a ditch, and contains a large cathedral, a handsome Gothic town-house, a Jesuits' convent, and an ancient prison. On the n. of the town is a lofty rock, divided into two peaks by a deeply-cut ravine. On the highest peak is the ruined castle of Tourbillon, built in 1294; on the other, the castle of Valeria, now used as a seminary. An excellent wine, called Malvoise is made here. Sion is called *Civitas Sedunorum* in a still existing inscription in honor of Augustus, to be seen in the cathedral; in the middle ages it was named *Sedunum*. Pop. '70, 4,895.

SIOUT, also *Es-Siout* and *Osiut*, the chief city of upper Egypt, stands near the w. bank of the Nile, and is 200 m. in direct line s. of Cairo. It has several fine mosques, bazaars almost as well furnished as those of the capital, some good baths, and one or two well-built houses. Siout manufactures great quantities of the best pipe-bowls. It is the residence of the governor of upper Egypt; the resort of the caravans from Darfur, that come by the way of the great oasis, and until recently was the principal seat of the Egyptian slave trade. Pop. about 25,000. Siout is built on the site of the ancient Lycopolis, but few remains of the Græco-Egyptian city are extant. From the neighboring heights of the Libyan mountains, which contain numerous rock-sepulchers, the view over the valley of the Nile is, in the opinion of Lepsius, the finest in Egypt.

SILOUX, a co. in n.w. Iowa, bounded by Sioux river on the w., which separates it from Dakota, crossed by the Sioux city and St. Paul railroad, and drained by Rock river and Willow creek; 750 sq. m., pop. '80, 5,426. The surface is slightly undulating; the soil is fertile. Co. seat, Orange City.

SILOUX, a tribe of north American Indians, calling themselves also Dakotas, inhabiting Dakota territory. They are a brave and warlike people, generally at war with the Chippeways. Formerly they numbered 30,000, and counted 7,000 warriors; at present their whole number is estimated at 23,250. Roman Catholic missions were established among them 200 years ago, and Presbyterian missions recently. The Sioux are more advanced toward civilization than any tribe of the north-west.

SILOUX (*ante*), or **DAKOTAS**, a race or collection of Indians, inhabiting Dakota, Nebraska, Wyoming, etc., comprising the Santees, Yanktons, Minikonges, Brulés, Sissetons, Unkpapas, Ogallallahs, Aldewakantons, Wahpetons, and Tetons. When found by the French in 1640, near the head-waters of the Mississippi, they were called the NadowessioUX, whence the name Sioux. In 1689 Nicolas Perrot took possession of their country for the French. In wars with the French they were driven down the Mississippi and into the plains of the Missouri. Their territory extended from the Mississippi to the Black Hills, and from Devil's lake to the mouth of the Big Sioux. The American board sent missionaries to the Wahpetons near fort Snelling in 1835, and the Methodists in 1836, who established schools and printed books in their language. In 1837, Sep. 29, the Sioux ceded to the United States all their lands e. of the Mississippi for \$300,000, and in 1851 for 3,000,000, all the lands from Otter Tail lake through lake Traverse to the junction of the Big Sioux and the Missouri, comprising 25,000,000 acres, except a reservation of 20 by 140 miles. The government's neglect to perform its treaties led to hostilities, but the Sioux were defeated by gen. Harney at Little Blue Water, Sep. 3, 1855, and a treaty of peace was concluded. Subsequently their annuities being withheld and frauds practiced upon them, they rose and killed nearly 1000 settlers. They were conquered by gen. Sibley and gen. Sully, 1000 were captured and 39 hung. Gold having been discovered in the Black Hills in 1868, the United States wished to purchase the tract, and induce the Indians to emigrate to the Indian territory. In 1875 Sitting Bull, Red Cloud, and Spotted Tail visited Washington, but refused to sign a treaty. Much mission work has been done among these Indians. See RIGGS, STEPHEN.

SILOUX CITY, a city in n.w. Iowa, co. seat of Woodbury co., incorporated 1857; on the e. bank of the Missouri river, at the mouth of the Big Sioux, 125 m. above Omaha, and 61 m. s.e. of Yankton; pop. '80, 7,366. It is the junction of the Illinois Central, the Dubuque and Sioux City, the Dakota Southern, the Sioux City and St. Paul, the Sioux City and Pacific, and the Sioux City and Dakota railroads. It is situated between Perry and Floyd's creeks, on bench land sloping from the river, and at the n. and w. the ground rises into bluffs on which the finest residences are placed. The streets cross each other at right angles; it has a new court-house, 9 churches, a public hall, a library association, 4 newspapers (1 German), and 2 graded schools. It has an academy of music costing \$80,000, a hotel, 3 banks—a national bank, a private bank, and a savings bank. It is supplied with water and lighted by gas; has 4 grain elevators and a pork-packing establishment; and an important trade with Iowa, Nebraska, Dakota, and, by the Missouri, with Montana. It has a well-regulated fire department. Among its manufactures are the railroad repair-shops, foundries and machine-shops, breweries, and marble-works.

SIPHON is a tube bent so that the two legs are either parallel, or incline at an acute angle, and is employed to draw off liquids from vessels which it is not convenient or desirable to move. If the end of the short leg of a siphon be plunged into the liquid, and the other leg be suffered to hang outside the vessel, then, whenever the siphon is exhausted of air (a process which can be performed by suction by the mouth or a pump, or by filling the tube with the liquid it is employed to decant, and keeping it so filled till it is

placed in its proper position), the liquid will at once flow out of the vessel through the tube, and continue to do so either till it falls below the level of the outside end, or till the inside end ceases to be immersed. The principle of this simple and efficient instrument is easy of explanation: let ABC (fig.) be a siphon with

Siphon.

one leg, BC, partially immersed in liquid, and suppose the whole siphon filled with the same liquid; then at A we have the pressure of the atmosphere acting upward into the tube in opposition to the pressure of the liquid in the leg BA; at C we have the pressure of the atmosphere (transmitted through the liquid), and the pressure of the liquid in the vessel outside (which balances an equal height of liquid inside) the tube, acting upward into the tube in opposition to the pressure downward of the liquid in the leg BC. The effective pressures inward at A and C are, respectively, the atmospheric pressure less by the pressure of the liquid in BA, and the atmospheric pressure less by the pressure of the liquid in BD; and as the latter of these two is the greater, it overcomes the other, forces the liquid in the tube out at A, and that in the vessel into the tube at C, the process continuing till the liquid falls

to the level of C (when air is admitted), or of A (when the two pressures become equal). It is evident from the above explanation that when A is on or above the level of D, the surface of the fluid, there can be no flow through the tube; also, that it is quite immaterial whether the longer or the shorter leg be immersed, if only A be below the level of D. If the bend of the siphon be 33 ft. for water, or 30 in. for mercury, above D, the pressure at C, which produces the action of the siphon, becomes the weight of the atmosphere, diminished by an equal weight of a column of fluid, in which case the resulting pressure is zero, and there is no flow through the tube. The flow increases in rapidity and force as the difference of level between D and A increases, and as the difference of level between D and B diminishes. Many siphons have a suction-pump permanently attached to the end of the outer leg for the purpose of exhausting the air inside. Another variety is the *Wurtemberg siphon*, which has two equal legs, the extremities of which are bent upward, so that when the siphon is once filled with fluid, it remains full, and is always ready for use.

SIPHONOSTOMA. See FISH-LOUSE

SIPHONOSTOMATA, a large group of gasteropodous mollusks, of the order *pectinibranchiata*, having the mantle prolonged into a siphon, by which the water enters the gill-chamber. The shell is spiral, the aperture notched or produced into a canal in front, often much produced. To this group belong the families *cypraidæ* (cowries, etc.), *volutidæ*, *buccinidæ* (whelks, etc.), *muricidæ*, and *strombidæ*. They are almost all carnivorous, and move about with considerable activity.

SIPUNCULUS, a genus of *echinodermata*, giving its name to a family, *sipunculaceæ*, and to an order, *sipunculidæ*. The *sipunculidæ*, although ranked among the *radiata*, and having the essential characters of that division of the animal kingdom, resemble the *annelida* in form, general appearance, motions, and habits, as well as in their softer covering, which is leathery and not calcareous, and in the absence of calcareous spines. The *sipunculaceæ* have a retractile proboscis, around the extremity of which is a circle of tentacula, and at the base of it the anus. In the genus *sipunculus* the proboscis is long and cylindrical, with a circle of tentacula near its extremity. *S. Bernhardus* is common on many parts of the British coast, living at the bottom of the sea, at a depth of from 10 to 30 fathoms, and occupying as a habitation the shell of some univalve mollusk, for the protection of its soft wormlike body. It secures the entrance of the shell by a plaster-work of sand, leaving only a hole wide enough for the protrusion of its long flexible proboscis. Other species, instead of sheltering themselves in shells, burrow in the sand. Among these is the **EDIBLE SIPUNCULUS** (*S. edulis*), much esteemed by the Chinese.

SIR (Fr. *sieur* and *sire*, contracted from *seigneur*; from Lat. *senior*, elder), a term originally corresponding to *dominus* in Latin, and which has come, when appended to the Christian name and surname, to be the distinctive mark of knighthood. It was at one time the practice to use the same title in addressing the clergy, a familiar instance being sir Hugh Evans in the *Merry Wives of Windsor*. To so great an extent did this usage obtain, that a "sir John" came to be a common sobriquet for a priest. "Sir" was here a translation of *dominus*, the term used for a bachelor of arts, originally in contradistinction from the *magister*, or master of arts, but eventually extended to the clergy without distinction. Used along with the Christian name and surname, "sir" is now applied exclusively to knights and baronets. Standing alone, it is a common complimentary mode of address used without much consideration of rank or social status. "Sire" is another form of the same monosyllable, which has been adopted from France as a mode of addressing royalty.

SIR-DA'RIA. See JAXARTES.

SIREN, a genus of perennibranchiate batrachia, of eel-like form, but having two small weak limbs on the fore part of the body. Each foot has four toes. There is no vestige of a hinder pair of feet, nor of a pelvis. The vertebræ are numerous, and each of the vertebræ of the body carries a pair of short ribs. The vertebræ of the tail are compressed, and gradually diminish in size to its tip. The head is flattened, the mouth not deeply cleft, the muzzle blunt, the eyes very small, the ears concealed. The teeth are small; the lower jaw is furnished with them all round; there are none on the upper jaw, but two rows on each side of the palate. On each side of the neck are three gills, each consisting of a short fleshy stalk, supporting a beautiful fringe-like tuft, and water passes from the mouth to the gills through openings as in fishes. But the siren has also lungs, which are long bags, one on each side, beginning behind the heart, and extending almost the whole length of the abdomen. The blood disks are remarkable for their large size, exceeding even those of the proteus. The sirens inhabit the swamps of the Carolinas and other southern parts of North America. They live chiefly in the mud, but sometimes are to be seen swimming in the water, and even make excursions on moist ground. They feed on worms and insects. *S. lucertina* grows to the length of about 3 feet. Its color is blackish. The tail is compressed. The other species are smaller.

SIRÈNE, an instrument for the production of musical sounds in such a manner as to enable us to discover their ultimate nature. In the simplest form of sirène a vane consisting of four equal plates, attached to a delicately supported axle, is so fixed in a metal tube as to close it almost completely (with the help of stops), when either pair of plates is perpendicular to the axis of the tube. When air is forced from a bellows through a pipe, it gives the vane a rotation, and thus produces a current which is interrupted four times in each revolution. In other words, four times in each revolution the air escapes freely, giving rise to a sound. While the vane revolves slowly, the ear distinguishes these successive puffs; but when the revolutions are more numerous than about five per second, the successive puffs cannot be distinguished, and the recurrent sounds are merged into a uniform note, whose pitch rises (i.e., it becomes more and more shrill) the faster the vane revolves. Such an instrument works well when driven by water instead of air. What it shows is, that musical sounds consist of the repetition, at equal very small intervals of time, of some definite noise. By turning the vane by means of a train of wheels, so as to give it a definite rate of rotation, the number of such repetitions per second, necessary for the production of a given musical note, may be measured.

But the sirène of Cagniard de la Tour is much more valuable for such a purpose, as it counts for itself the number of repetitions per second. In principle, it is identical with the simpler instrument just described; but the details of its construction are different. It consists essentially of two circular disks, the upper of which is free to revolve so as almost to touch the lower. In each a series of holes is cut, arranged at equal distances in a circle about its axis. Through the holes in the lower (fixed) plate, streams of air are admitted from a bellows, and pass through the corresponding holes in the upper (movable) plate, when the pairs of holes are superposed; but are checked when the upper plate is turned a little, readmitted when the plate turns a little further, and so on. The holes are pierced *obliquely* through the upper plate, so that the issuing stream makes it turn about its axis. The sounds given by this instrument are exceedingly pure (see SOUND), like those of the flute or tuning-fork. The axis of the upper plate carries an endless screw, which turns a light train of wheels (with dials) resembling that of a gas meter, so that when, by proper adjustment of the pressure in the bellows, the instrument gives steadily some definite note, we may observe the number of turns in any number of minutes by watch. The number of puffs is obviously to be found from this by multiplying by the number of holes in the plate, since during one turn any hole in the upper plate has been opposite each of those in the lower plate in succession. Thus we find the number of puffs per second necessary to the formation of any given musical note.

More complex forms, such as Helmholtz's double sirène, have been devised for more recondite branches of the science. See SOUND.

SIRENIA, an order of aquatic mammals, allied to the cetaceans, and including the manatees (q.v.) and the dugongs (q.v.).

SIRENS (Gr. *seirènes*, the "entanglers," probably from *seira*, "a cord" or "string") figure in Greek mythology as young maidens, who sat on the shores of a certain island or promontory near the south-western coast of Italy, and sang with bewitching sweetness songs that allured the passing sailor to draw near, but only to meet with death. Homer speaks of them in the plural, but does not specify their number; later writers mention two and three by name, and assigned them various genealogies. Their tenure of life was dependent on the successful exercise of their charms. If any seamen could resist the enticements of their magic music, they were doomed, but Ulysses or the Argonauts alone succeeded in doing so. It is related by Homer, in the *Odyssey*, that when the former in the course of his wanderings approached their perilous home, he, by the advice of the sorceress Circe, stuffed the ears of his companions with wax, and lashed

himself to a mast, until he had sailed out of hearing of the fatal songs. Others say that it was the Argonauts who got safely past, owing to the superior enchantment of Orpheus's singing, whereupon the sirens threw themselves into the sea, and were transformed into rocks. The Latin poets give them wings, and in works of art they are often represented as birds with the faces of virgins, and are provided with musical instruments. There is obviously a close resemblance between the mermaid (q.v.) of northern mythology, and these Græco-Mediterranean sirens. The Loreley of the Rhine is only a river-siren, though a more exquisite enchantress than ever Greek fancy conceived.

SIRINAGUR. See SERINAGUR.

SIR I-PUL, a t. of Afghan Turkistan, 45 m. s.w. from Balkh, in lat. $26^{\circ} 21' N.$, and long. $66^{\circ} 28' E.$, on a river which loses itself without reaching the Jihoon. It is the capital of an Uzbek chief. Pop. 18,000.

SIRIUS, otherwise called *canicula*, or the *dog-star*, is a star of the first magnitude, the brightest in the heavens, and is situated in the constellation of *canis major*, or the "great dog." It is about 123 billions of miles distant from the earth. See STARS. It has long been known to possess a "proper motion" (i.e., an independent progressive motion), which was for a time believed to be in a straight line, but has now been shown to consist of an undulatory progressive motion on each side of a middle line. This motion was investigated by prof. Peters of the Pulkowa observatory, Russia, on the supposition that its anomalous character was produced by the attraction of some unseen neighbor, and his calculations being completed and verified (on this supposition) by Mr. Safford of Washington, the distance of Sirius from the center of gravity of both was determined to be 1495 millions of miles. In Jan., 1862, Mr. Alvan Clark of New York, chancing to observe Sirius through a powerful telescope, detected a minute star (which had never before been observed) situated at an angular distance of $7''$ from Sirius representing about 4,300 millions of miles, and it is generally believed that this is the disturber in question. By photometric measurement it has been shown, that, supposing the intensity of the sun's light for unit of surface to equal that of Sirius, it would require 400 suns at the distance of Sirius to send us the light which that star does; and our sun at the distance of Sirius would appear less than a star of the sixth magnitude, and be invisible to the naked eye. The Egyptians called this star Sothis, and at one time its "heliacal rising" (q.v.) was a sure forerunner of the rising of the Nile; while among the Romans it was considered as a star of evil omen, whose appearance above the horizon coincided with (or even caused) the unhealthy and oppressive heats of summer. Hence the origin of the various superstitions regarding the dog days (q.v.), many of which are still current.—The term "dog star" was also applied to Procyon, a bright star in *canis minor*, whose heliacal rising differs only by a few days from that of Sirius.

SIROCCO. See SIMOOM.

SISCO, a common name for several species of small fishes of the genus *argyrosomus*, inhabiting the northern lakes of the United States. They resemble the herrings in form; lower jaw longest, short intermaxillary bones. They rarely attain a pound in weight. *A. clupeiformis* is found in all the great lakes, generally inhabiting shoaler waters, while *A. hogi* is found only in the deep waters of lake Michigan, from 30 to 70 fathoms beneath the surface. When salted and smoked they are much esteemed.

SISCOWET, **SISKAWITZ**, *Salmo siscowet*, a species of lake trout. It is about five times as long as the head, exclusive of the tail fin; and there is about the same proportion between the length and breadth. The color varies with the feeding ground, and is brighter during the breeding season, as is commonly the case with the family. This species is characteristic of lake Superior, but is found in the deep water of the other great lakes. It is said to have been first scientifically noticed by prof. L. Agassiz, in 1850. Its average weight is about four and a half pounds, maximum eight pounds. The color of the flesh resembles that of the great lake trout, as well as its texture. It is very much valued, particularly for salting and packing. It spawns in August and September, in deep water, never ascending the rivers.

SISKIYOU, a co. in n. California, adjoining Oregon; drained by the Klamath river and its branches; 5,000 sq.m.; pop. '80, 8,610—5,620 of American birth, 1561 Chinese. Before 1874 the county included part of what is now Modoc county. The surface is mountainous, mount Shasta, the highest peak being 14,442 ft. high. There are some fertile valleys, where wheat, oats, butter, wool, hay, and cattle, are staples. Co. seat, Yreka.

SISMONDI, **JEAN CHARLES LEONARD DE**, a distinguished historian of Italian descent, was born at Geneva on May 9, 1773. He received his education as a boy at the "college" or high school of his native town. At the due age he was removed to the auditoire, or university. Before he had completed his education, the pecuniary reverses of his father made it necessary for Sismondi to do something for his own maintenance, for which purpose he entered the counting-house of the eminent firm of Eynard & Co. of

Lyons. Hateful as mercantile pursuits seem to have been to him, he applied himself to his drudgery with all diligence. He became a thoroughly good clerk, and in after life he acknowledged that the practical training had been of incalculable benefit to him. The French revolution sent Sismondi back to Geneva, but the storm following, he took refuge in England, along with his family. Home-sickness soon sent them back to Geneva, but the continuance of political trouble made it impossible to remain there long. In 1795 they bought a small farm near Pescia, in Tuscany, where their narrow circumstances rendered it necessary for Sismondi almost literally to put his hand to the plow. He had now, however, leisure for literature. In 1798 he began to collect materials for his *History of the Italian Republics*. In 1803 appeared a work on political economy, *De la Richesse Commerciale*, in which he writes like a decided follower of Adam Smith, though at a later period, in his *Nouveaux Principes d'Economie Politique* (1819), he abandoned the wiser views of his youth. In consequence, a professorship in this science was in the same year offered to him in the university of Wilna, which he declined. It was in history, however, that his literary forte lay. The 16 vols. of his *Histoire des Républiques Italiennes*, published between 1807 and 1818, placed him in the first rank among contemporary historians, and brought him praise from the most distinguished men in France and Germany. The events of the hundred days occasioned one of the most memorable passages in the life of Sismondi—his interview with Napoleon. In 1813 appeared his *Littérature du Midi de l'Europe* ("Literature of the South of Europe," Eng. by Roscoe, frequently reprinted). In 1819 he began his best and greatest work, the *Histoire des Français*, with which he was occupied until his death. On April 19, of the same year he married Miss Allen, an English lady, whom he had previously met in Italy. This marriage was followed by many happy years, during which Sismondi resided at Geneva, making frequent visits to Pescia and England. His latter days were, however, darkened by the troubles of his native city, in whose politics he took a keen interest. He died June 25, 1842. Sismondi has contributed more to historical literature than any other writer of his time, and the labor which he bestowed on his works has never been surpassed. "Nine times," he says, "have I traversed Italy, and I have visited every place which has been the scene of any great historical event." For twenty years he worked habitually eight hours a day. Both as a worker and as a thinker he was thoroughly conscientious. His mind was to the last open to truth; neither fettered by prejudice nor blinded by self-conceit. At the same time, no one has surpassed him in tenacity of purpose, nor in energy in following it out. His feelings on religious questions were especially intense. Having on one occasion heard a sermon in an English church on eternal punishment, he vowed never again to enter another church holding the same creed; and "never to contribute to spread what the English call their reformation; for by its side Romanism is a religion of mercy and peace." His private character was singularly amiable and benevolent. His whole career is a noble one, full of interest and instruction.—See *Quarterly Review*, Sept. 1843; *Vie et Travaux de Sismondi* (Paris, 1845); see also his correspondence with Mlle. de St. Aulaire (Paris, 1863); and his *Lettres Inédites à Madame d'Allanby* (1864).

SISTERHOODS, in the Roman Catholic church, began in the 4th century. Slowly at first, but with great and rapid increase in the 17th and 18th centuries, they became the right arms of charity, and at last organized bulwarks for the preservation and propagation of the church faith by assuming the education of children, and girls especially, of the poor. French authorities classify them into contemplative and active: the former devoted to religious routines, partly of study, of worship of saints, and of such penances and mortifications of the flesh as the barbarous ideas of the times required; the latter, though less beneficent than they have since become, were to some extent devoted to useful works in narrow spheres. The organizations called active, occupied with good works rather than devotions, served in the hospitals which were established in the middle ages by the church. Every convent had its hospital for the poor, and the superior devotedness and good influence of women as nurses led to the establishment of orders of women who devoted themselves to the work. Convent life during many centuries was a fashionable refuge for maidens and matrons, especially in France, whose misfortunes had deprived life of its common hopes, and to whom religious seclusion offered peace, quiet, the satisfaction of doing good, the hope of future reward, and, to a few, headship and authority. The sisterhood devoted to outside beneficence were but a small part of these vast convent establishments, but have continued to multiply, while the purely devotional orders are becoming extinct.

Down to 1840 the church had conferred its sanction upon 164 distinct organizations of sisters. Previous to A.D. 1500 there were 34 orders founded on the contemplative system and 17 active; 1500-1600, 10 contemplative to 13 active; 1600-1700, 54 active and 12 contemplative; and 1700-1840, 40 active and not one other. Since 1840 a considerable number of the most efficient of these active orders have originated, outside of the church or its convents, which have received sanction and ordination after their usefulness has been well established. The following chronological list is only of those institutions of sisters whose mission was in part of beneficence outside of convent walls:

ORDERS OF ACTIVE SISTERS IN THE ROMAN CATHOLIC CHURCH DOWN TO 1840.

Date.	Name of Order.	Date.	Name of Order.
580	Notre Dame de St. Paul.	1633	Miséricorde.
626	Converties.	1636	Miramiones.
1097	Hospitalières Hôtel Dieu.	1636	Filles de St. Généviève.
1207	Canonesses— <i>secular</i> .	1638	Notre Dame de Charité.
1212	Sœurs de Saint Esprit.	1638	St. Joseph Sisters.
1215	Madeleine.	1643	Hospitalières de la Flèche.
1220	St. Elizabeth of Hungary.	1645	Sœurs de St. Agnes.
1265	Merci (third order).	1650	Sœurs de St. Joseph au Puy.
1288	Elizabeth of Hungary.	1650	St. Joseph Sisters.
1290	Sœurs Grises.	1652	Filles de St. Charles Borromeo.
1328	Hospitalières Canonesses.	1652	Providence de Dieu.
1328	" "	1650	Sœurs de St. Alexis de Limoges.
1413	Filles de Marthe.	1659	Villeneuve Hospitalière.
1477	Consort à Milan.	1660	Sœurs de St. Thomas de Villeneuve.
1534	Sœurs Angeliques.	1661	Union Crétienne.
1537	Ursulines de Paris.	1662	Enfance de Jésus.

Persons who have not been through the great hospitals of Europe are unaware of the extent of the work of the sisterhoods. When these hospitals were under the government of the church instead of the state, the mothers-superior of the sisters of one order or another were supreme managers of the work and attendance on the patients. The Ursulines have been longest and most widely known in this labor; established in 1537 by Angela de Brescia, both in Milan and in Paris, with the intention that the sisters should not be recluses, but live in their own homes and go out to do the work which the superior of the order should point out. But it was found that greater efficiency could be attained by associating in a community, and the order merged into the convent system. The founder inserted in the rules of the order that its members should be free to act according to the need of the age, and that the sisters should be free to so far live among others as to enable them openly to seek out the afflicted and to perform any act of charity which they could find to do. They now labor in nearly every civilized country in the world, but are subject to the government of the Roman Catholic church. The Sisters of St. Vincent de Paul, less ancient, equally renowned for their devotion and self-abnegation, were organized by a priest of that name and formed their first community in Paris in 1633, and systematized the education of their number to specific labors according to individual fitness. No external signs of devotees were required, and no vows for more than a year. Though organized by a priest, he seemed to guard it against absorption into church control, and abolished the system of requiring applicants to hospitals to confess before being admitted. Throughout Europe, but far more in France than elsewhere, the ladies perfected the means of utilizing the latent benevolence around them, and educated to the work poor girls desirous of devoting themselves to it. Christ's hospital, in London, was committed to their charge in 1643, and in 1652 they went in numbers from Paris to Warsaw during a plague in that city. All the operations of housekeeping, as well as nurs-

ing and light surgical work, were practiced, in order to perfect their members for every service that could be rendered. In 1789 the order had 426 houses in France. They were seriously crippled and interfered with by the turbulent reforms of the French revolution, which, in suppressing all monastic and conventual establishments and confiscating their property, deprived the sisters of their communal homes, notwithstanding their communities were excepted in the decrees of suppression. In 1801 Napoleon gave a new civil legal character to the order by a decree of the minister of the interior; since which time there has been no check to their extension. Like members of similar orders they are now known simply as Sisters of Charity. The order was introduced into the United States in 1808 at Emmitsburg, Md., by Mrs. Seton, of New York, but seems to have been more devotional than active in its work there. In 1814 a branch opened in Philadelphia to conduct an orphan asylum for children orphaned by the yellow-fever pestilence. They may be found in nearly all our cities. North France seems a perennial spring of similar organizations, nearly always originating with poor girls or women whose zeal and will to do good attract a cluster of similar spirits to form new organizations with some feature peculiar to the needs around them. The Sisters of the Good Saviour, founded by two poor girls at Caen, Normandy, in 1720, while similar in their first work to the preceding, took also a special interest in the insane, and in 1817-18 were charged by the French government with the care of insane women and afterward of men. They have become specialists in that charity, and in the care and education of the deaf and dumb in France. In 1874 the Caen house of 300 sisters had charge of 1000 insane persons. In Montreal and Quebec a similar work has been committed to the Sisters of Providence. The most remarkable recent organization of Sisters of Charity is the one called "The Little Sisters of the Poor," originated at St. Servan, a village on the n. coast of Brittany, under the guidance of a village priest, Le Pailleur, Marie Augustine, and a few poorest-of-the-poor sewing-girls and old women. They formed practically a band of beggars, but so thorough in their self-abnegation to help others, so quiet and unobtrusively bent on doing good, that by 1842 they had attracted to their work the full sympathy of the community around them, and a wide fame. They were then organized into an order under the church, with the above name, and their organization in many cities has become the almoner of the people always willing to give of their abundance rather than of their time when sure that the gift will reach the needy. Their specialty is rather among the aged and suffering poor than in hospital service, and they make their homes in the midst of the want and squalor which they alleviate. They now have branch houses in the United States, but it is an alien soil to the women who have been so useful in France, and a field less needing them.

A Protestant order of the Sisters of Mercy was founded at Davenport, England, 1845, by Miss Lydia Sellon, who adopted a garb for the vocation; but the sisters were bound by no vows except of obedience to the superior while connected with the organization. It was composed of three classes of workers: those living in community and devoted singly to its active and laborious work; those residing with the community to give minor assistance while living a calm religious life; and married or single women in society who can be relied on to give time to the work. It has a number of branches in England. The sisterhood of St. John the Baptist is another association under the English church, modeled upon the conventual system rather than upon the more practical working models of the modern French Sisters of Charity. There are quite a number of similar societies in England, all established within the past 30 years, of which the Sisters of the Poor, established in 1851, is one of the most active. In the United States the voluntary associations of benevolent ladies, acting by committees, in single church congregations, or by non-sectarian associations, have an expansion and efficiency that enable them to do the same kind of work as the Sisters of Charity, except in hospitals and asylums, where the thorough organization, the devotional zeal, and the trained experience of the professional sisters, is pre-eminently valuable. Dr. Mullenberg established the Sisters of the Holy Communion in New York in 1845, who have no established garb, are required to be between 25 and 40 years old, to enter with the consent of parents or guardians, to labor on probation one year, and who may leave at their own pleasure. This organization has done a quiet but very efficient work in the charge of St. Luke's hospital, New York. In recent years numerous sisterhoods have been organized in the Protestant Episcopal church in this country, whose work thus far promises well, though the system is not yet so fully developed as to decide its ultimate results.

SISTERS OF CHARITY. See BROTHERS AND SISTERS OF CHARITY.

SIS'TOVA, an important commercial t. of the principality of Bulgaria, on the s. bank of the Danube, about 35 m. up the river from Rustchuk. It has several mosques, an ancient and strong castle, where the "peace of Sistova" between Austria and Turkey was concluded in 1791; manufactures cottons and leather, and carries on an active river-trade. Pop. about 20,000.

S'ISUPĀLA is in Hindu legend the sovereign of Cheti, a country situated in central India, who was the enemy of Krishna (q.v.), and ultimately was slain by him. The history of this enmity, and the death of S'isupāla, are the subject of the *S'is'upālabadhā* of Māgha. See SANSKRIT LITERATURE.

SISYPHUS, a personage of Greek mythology, whom later accounts make to be the father of Odysseus. He is said to have been founder and king of Ephyræ—afterward Corinth—and both he and his whole house were notorious for their wickedness. He is, however, best known for the punishment which he suffered in the lower world, either for treachery toward the gods, or for his wholesale robbery of travelers, whom, at the same time, he murdered with a huge block of stone. He was condemned to roll an immense boulder from the bottom to the summit of a hill, which, whenever it reached the top, rolled down again, and the task of Sisyphus had to be begun anew.

SĪTĀ is, in Hindu mythology, the daughter of Janaka, a king of Mithilā, and the wife of Rāma. See VISHN'U. The word means literally "furrow," as she was not born in the usual sense of this word, but arose from a furrow when her father was plowing the ground, whence she is also called *Pārthivī* (from *pr'thivī*, the earth). Her history is related in the RĀMĀYAN'A (q.v.).

SITKA, or NEW ARCHANGEL, the principal settlement in the territory of Alaska, is a small place of about 2,000 inhabitants, on the w. coast of the island of Sitka or Baranov, the largest island in the group known as George's III.'s archipelago. Lat. 57° 3' n., long. 135° 18' west. Sitka was the residence of the governor of Russian America, and has a magnetic observatory. Here the chief establishments of the Russian-American company, incorporated 1799, for fishing and hunting fur-bearing animals, were situated. The company employed 50 ships, and about 850 men, but their privileges expired in 1863.

SITOPHO'BIA, or SITOMA'NIA. The repugnance to or refusal of food may range from mere impairment or loss of appetite, or hysterical antipathy to particular viands, to total and prolonged abstinence, as a symptom of delusion or delirium. In the insane, food has been consistently refused for years. During this time the system was, of course (see FASTING), sustained by compulsory alimentation. The causes of such a course are generally local disease in the organs of digestion, creating disgust and loathing toward food, and associating suffering with the process of nourishment; the fear of death, or the desire for death. The motives assigned for such feelings or resolution vary, of course, as the morbid condition may affect the stomach or the brain; and, according to the mental state predominating, suicide may be courted, or poisoning, drugging, or pollution of aliment may be dreaded. The throat or bowels may be imagined to be hermetically sealed; God or Satan may have imposed abstinence; the body is dead, inanimate, or belongs to another. Absurd as such principles of action may be, they prove inexpugnable to persuasion, or to the pangs of hunger and exhaustion, and require a special course of treatment. The determination may be exorcised by medicine; it may be overcome by commands, threats, bribes; it may be evaded by giving eggs, cocoa-nuts, milk from the cow, and other substances, into which mercury, arsenic, etc., cannot well be introduced; or it may be defeated by placing food in the stomach through the instrumentality of the stomach-pump. There have been epidemics of maniacal abstinence.—Chipley, *American Journal of Insanity*, July, 1859; Browne, *Report Crichton Institution*, 1854.

SITTA. See NUT-HATCH.

SIVA (a Sanskrit word, literally meaning happy, auspicious) is the name of the third god of the Hindu Trimūrti (q.v.) or triad, in which he represents the principle of destruction. The name Siva, as that of a deity, is unknown in the Vedic hymns, but established as such in the epic poems, *Purāṇas* and *Tantras*. The worshipers of Siva (see SAIVAS) assign to him the first place in the Trimūrti, and to them he is not only the chief deity, but the deity which comprises in itself all other deities. Thus, in the *S'iva-Purāṇa* (see PURĀN'A), he is addressed as Brahma, Vishn'u, Indra, Varun'a, as the sun and the moon, as earth, fire, water, wind, etc.; but even in the *Purāṇas* relating to Vishn'u, his power is exalted in praise, and he is addressed with the utmost awe. The symbol of Siva is the *Linga* (q.v.), emblematic of creation, which follows destruction. From each of his numerous attributes or characteristics he derives a name or epithet. He has five heads (hence his name *Panchānana*, etc., the five-faced); three eyes (hence his name *Trinetra*, etc., the three-eyed), one of which is on his forehead, and indicates his power of contemplation; and in the middle of his forehead he wears a crescent. His hair is clotted together, and brought over the head so as to project like a horn from the forehead. On his head he carries the Ganges, whose course he intercepted by his hair, when this river descended from heaven, so as to enable the earth to bear its fall (hence his name *Gangādhara*, etc., the Ganges-bearer). Round his neck he carries a garland of human skulls; and his throat is dark blue, from the poison which he swallowed when it emerged from the ocean, churned by the gods for the attainment of the beverage of immortality, and threatened to destroy the world. In his hands he holds the trident, a club or pole, armed at the upper end with transverse pieces, representing the breastbone and ribs adjoining, and surmounted by a skull and one or two human heads. His weapons are the *Khinkhira*, which is not described, a bow called *Ajakura*, or *Ajagara*, a thunderbolt, and an axe. As the destroyer of the world he is also called *Kāla* (time or death), and represented as of black color. One of his representations is also half-male

and half-female, emblematic of the indissoluble unity of the creative principle (hence his name *Ardhanārīśa*, the half-female-lord). He is clothed in a deer-skin; or he also holds a deer in one of his hands; or he sits on a tiger-skin, or is clothed in it. When riding his vehicle is the bull Nandi, whom he also carries as an emblem in his banner. He resides on the wonderful mount Kailāsa, the northern peak of the Himalaya, where he also rules over the north-east quarter. His principal wife is *Durgā* or *Umā* (q.v.); his sons are GANEŚA and KĀRTTIKEYA (q.v.). One of his principal attendants is *Tan'du*, who is one of the original teachers of the arts of dancing and mimicry, whence Siva is the patron of the dancers, and is called *Nates'wara* (lord of the dancers). Besides Tan'du, a host of other attendants and companions, together with demons and other beings surrounding him, are named by the Purāṇas.

Amongst the principal achievements of this god is his conflict with the god Brahma, who was originally possessed of five heads, but lost one through exciting the anger of Siva; for the fifth head of Brahma, once disrespectfully addressing Siva, and even challenging his power, Siva immediately cut off the offending member with the nail of his left thumb. A similar penalty he inflicted on *Dakṣa*, his father-in-law, who once performed a great sacrifice, but neither invited his daughter Sati nor her husband Siva. Siva, nevertheless, appeared at the sacrifice; but when Sati, offended at the reception she met with, threw herself into the sacrificial flames, Siva cut off the head of Dakṣa; and Dakṣa would have remained headless had not the gods interceded in his favor with Siva, who, out of compassion, replaced his head by that of a ram. Besides these feats he killed several demons—*Ruru*, *Andhaka*, *Tripuṇa*; and he also reduced to ashes *Kāma* (the god of love), who, at the instigation of the gods, undertook to excite the desire of Siva to procreate a son, but was indiscreet enough to choose for this purpose a time when Siva was engaged in fierce austerities (see KĀMA). Siva is especially worshipped under the symbol of the linga; but there are periods at which homage is paid to him also under other forms corresponding with the description given above. Hindu mythology knows, properly speaking, no incarnations of Siva like those of Viṣṇu; in some writings, however, some of his forms, especially that called Bhairava, and that called Virabhadra, are considered to be his sons or incarnations. Siva, like Viṣṇu (q.v.), has 1000 names by which he is addressed; some derived from his exterior attributes have been mentioned before; among the rest the principal are *Iśa* or *Iśwara* (lord); *Mahes'a* or *Mahes'wara* (the great lord); *Sankara* (the conferrer of happiness); *Rudra* (the terrible), or *Mahārudra* (the very terrible); and *Mahādeva* (the great god). For his worshippers, see SĀIVAS.

SĪVAS, a city of Asiatic Turkey, capital of the pashalic of the same name, is situated on the Kizil Irmak (anc. *Halys*), 60 m. s.e. of Tokat. Sivas covers a large extent of ground, is well built, has numerous old mosques, khans, gardens, and excellent bazaars, manufactures coarse woollens, and carries on a considerable transit trade. Pop. 25,000, of whom about 5,000 are Armenians, the rest Turks. Sivas is built on the site of the ancient *Sebasteia*, from which it derives its name.

SIVASH', or PUTRID SEA. See CRIMEA.

SIVATHE'RIUM (*Siva*, an Indian god; and Gr. *therion*, a wild beast), a remarkable genus of extinct mammals, found in the miocene strata of the Sivalik hills, in northern India. It had a large skull nearly as long as that of an elephant, supported on a neck little short of that of a giraffe, but much stronger. The face was short, and the nasal bones were prolonged into a pointed arch above the external nostrils, indicating the existence of a trunk or proboscis, an organ unknown among the Ruminantia to which it belonged. Like the existing 4-horned antelope of India it had two small diverging horns, rising from the brow between the orbits, and two large, probably palmated horns, further back. In general appearance it resembled a huge antelope. The remains of two species have been described by Falconer and Cautley.

SIWAH, or EL-SIWAH. See AMMONIUM, *ante*.

SIX ARTICLES, STATUTE OF, an enactment of the 33d year of Henry VIII., passed June 7, 1541, and commonly called the bloody statute. The object of this statute was to compel, from all the subjects of the crown, the uniform profession of certain doctrines, six in number, which are carefully recited in the act. These doctrines are (1), the real presence of Christ in the eucharist, and transubstantiation; (2), the sufficiency of communion in one kind only; (3), the unlawfulness of the marriage of priests; (4), the obligation of vows of chastity; (5), the propriety of retaining private masses; (6), the expediency and necessity of auricular confession. The penalties of this act exceeded in severity almost every precedent, at least in England, and they are specially severe against impugnors of the first article, all of whom, whether they dispute, write, or preach against it, are to suffer death as heretics, with forfeiture of all their goods to the crown, and without being allowed to abjure the error. With regard to the remaining four articles, the usual penalty of felony is attached to the crime of publicly preaching against them; private impugnors are liable for the first offense to imprisonment at the king's pleasure, for the second, to death; and the same, or nearly the same penalties are enacted against priests or nuns marrying or cohabiting, and against persons contemptuously refusing to confess at the prescribed times, or to receive the sacraments. The act at

first was enforced with great severity, but it was somewhat mitigated in 1544, and was finally repealed in 1549.

SIX NATIONS. See IROQUOIS.

SIXTUS, the name of five popes, of whom two call for particular notice, Sixtus IV. and Sixtus V. The former (originally named Francesco della Rovere), b. July 22, 1414, was a native of a small village near Savona, and a member of a very humble family. He was a scholar of the celebrated cardinal Bessarion, and became a member of the Franciscan order, in which capacity he obtained the highest reputation throughout Italy as a preacher. On the death of Paul II. in 1471, Rovere was elected to the Roman see. The domestic government of Sixtus has been strongly condemned. His inordinate partiality to his relatives exhausted the papal treasury, and led to many questionable exactions, and to gross abuses in the dispensation of church patronage. His excessive facility, too, in dispensing favors, led to his not unfrequently conferring the same benefice on more than one individual. But the worst imputation upon the memory of his pontificate arises in connection with the political affairs of Florence, and especially with the conspiracy against the Medici family, known in history as the Pazzi conspiracy. In the last act of this nefarious plot, the murder of Giuliano in the church at Florence, Sixtus's nephew, Riasio, was present, and when, after its failure, the leaders, including the archbishop of Pisa, were executed, Sixtus excommunicated the duke Lorenzo and all the magistrates of the city. Although this censure was passed professedly for the violation of the immunities of the church in putting an ecclesiastic to death, yet it has drawn upon Sixtus the suspicion of complicity, or at least of connivance after the fact; and has led to much controversy among historians. The necessities of defense against the Turkish invasion embarrassed still further the finances of the pope, and even the Catholic historians deplore the lengths to which ecclesiastical exactions and the simoniacal distribution of benefices were carried in the latter years of Sixtus. In many respects, nevertheless, his administration was liberal and public spirited. He did much to foster learning and to encourage art. Under him, the Vatican library continued to increase, and he contributed notably to the improvement and decoration of the city. In 1482 he entered into an alliance with the Venetians against the duke of Ferrara, which led to a general Italian war, and ended in a dissolution of the Venetian alliance, so mortifying to the pope, that his death is said to have been caused by chagrin and mortification, Aug. 13, 1484.—**SIXTUS V.**, in many respects, one of the most remarkable of modern occupants of the Roman see, originally named Felice Peretti, was born (Dec. 13, 1521) near Montalto, of parents so poor that his boyhood was spent in the humble occupation of a swineherd. While thus engaged, the boy attracted the notice of a conventual Franciscan father, who procured his admission into the order. He was ordained priest in 1545, and became professor of theology at Siena. His reputation as a preacher led to his being transferred to Rome, where he rose to its first dignities. He accompanied cardinal Buoncompagno as theologian in his legative mission to Spain (1565); and on the accession of Pius V. to the pontificate, was named cardinal (1570). On the accession of his former patron, Buoncompagno, under the name of Gregory XIII., cardinal Montalto might have exercised the highest influence, but he lived a retired and mortified life, and was believed to have fallen almost into the decrepitude of age and infirmity. This appearance was afterward ascribed by his enemies to the design of concealing his ambitious views; and there is a well-known but apocryphal story of his having, when elected pope on the death of Gregory in 1585 (April 24), flung aside his crutch, and revealed himself to the astonished cardinals in the full vigor of his physical strength and his moral character. His pontificate, however, was a most active and energetic one, and was marked by vigorous measures of improvement in every department of administration, ecclesiastical as well as civil. His first care was to repress the prevailing license and disorder of the city of Rome, and of the papal states generally, by effectually breaking up and exterminating the lawless bands of outlaws by which both were infested. His administration, both in this matter and in the repression of immorality, was rigorous perhaps to the extreme of cruelty; but the evil was one which seemed to call for extreme remedies. He reformed the administration of the law, and the disposal of public patronage; and he entered upon numerous and most comprehensive projects for the moral and material improvement of Rome. Many of his great works are still recognizable at Rome under his name, and are popularly remembered as his; among which are the library buildings of the Vatican. A distinguishing characteristic of his administration, too, was its disinterestedness. He steadfastly refused to use his position for the purpose of advancing any of his relatives, or to bestow upon them property or money derived from the public; and by judicious retrenchment he secured within the first years of his short pontificate a surplus of above 5,000,000 of crowns. It is of course impossible to enter into the details of his foreign policy; it will be enough to say that its great aim was, in the strongest sense of the words, to advance the cause of the Roman Catholic church in every portion of Christendom, against the Huguenots in France, against the Lutherans in Germany, and against queen Elizabeth in England. At the same time, he entertained a deep jealousy and apprehension of the designs of Spain; and he resisted persistently the excessively rigorous measures of the

Spanish inquisition as organized under Philip II. His church administration was equally vigorous and energetic. He fixed the number of the sacred college of cardinals at 70; and it was under him that the present organization of separate congregations of cardinals for the several departments received some of its most important developments. He published a new edition of the Septuagint, and an edition of the Vulgate, which has become famous from the multiplicity of its errors, subsequently corrected in the edition of Clement VIII. Many of the popular stories regarding him are derived from Gregorio Lete's *Vita di Sisto V.* (2 vols., Lausanne, 1669), a work of no authority. See also Tempesti, *Storia della Vita e Gestì de Sisto V.* (2 vols., Rome, 1754); Lorentz, *Sixtus V. und seine Zeit* (Mainz, 1852); Ranke, *Fürste und Völker von Süd-Europa*, and Von Hübner, *Sixtus V.* (1874).

SIZ'AR (from *size*, in university slang, an allowance of victuals from the buttery—or the smallest quantity of anything which can be bought, a word derived from *assize*, formerly the same as *assess*, to apportion), a name given to an order of students at Cambridge and Dublin universities, who are admitted on easier terms than others. Duties of a somewhat menial kind were originally required to be performed by the sizars, but these have long since gone into disuse. Sizars are not on the foundation, and therefore so long as they remain such, are not eligible for fellowships; but they may at any time become pensioners, and generally sit for scholarships immediately before taking their first degree. If successful, they are on the foundation, and may become candidates for fellowships when they have taken their degree.—At Oxford, there is a similar order of students, denominated servitors.

SIZE. See GLUE and GELATINE.

SKA'GEN, CAPE, or THE SKAW, the most northerly point of Jutland, Denmark. On it is built a light-house of stone, 67 ft. high, the lat. of which is 57° 43' 8" n., long. 10° 36' 5" e., and near it is a small town of 1400 inhabitants.

SKAGER-RACK ("Crooked Strait of Skagen;" *rack* is probably from the same root as A.-S. *raca*, Ger. *rachen*, thus being equivalent to the Celtic *kyle* [in kyles of Bute], Lat. *gula*, English *gully*—is the *race* of Alderney allied to *rack*?), an arm of the North sea (q. v.), lying between Denmark and Norway, and communicating with the Cattegat, is about 150 m. long from w. s. w. to e. n. e., and 80 m. broad. The depth is much greater on the Norwegian than on the Danish coast, being on the former about 200 fathoms, while on the latter it varies from 30 to 40 fathoms, increasing toward the center to about 60. When free from violent storms—to which, however, it is very subject—the current runs e. on the side next Denmark, and w. on that next Norway, the harbors being all on the latter coast.

SKALD (allied to *skill*; the radical sense is to separate, and hence to discern) signifies, in old Norse, a poet. The name was given specially to that class of poets who exercised their art (*skáldaskapr*) as a vocation requiring a learned education; that is, a knowledge of the construction of verse, and of the enigmatical imagery, roughly shaped out of obscure tradition, to which Scandinavian poets were prone. The great, if not the only aim of the Skaldic poetry was to celebrate the deeds of living warriors or of their ancestors. For this reason princes attached skalds to their courts, and competed with each other, by magnificent presents, for the possession of the most skillful minstrels. Very few complete Skaldic poems are extant; but, on the other hand, the multitude of fragments preserved, partly in the younger Edda (q. v.), partly in the Sagas (q. v.), and the Heimskringla (q. v.), is very great. A manuscript of the younger Edda, belonging to the university of Upsala (which has been printed in the *Historia Literaria Islandica* of Einarsen), contains a list of the most celebrated Icelandic and Norwegian skalds of the 13th c., under the name of *Skáldatal*. The songs relating to the religious and heroic traditions of the north, which are found in the Edda, go back to an earlier time in which the class or school of "skalds," properly so called, did not yet exist. The authorship of these primitive Eddaic songs is unknown; but they are the sources from which the "skalds" of later times drew much of their inspiration.

SKA'LITZ, or SZAKOLCZA, a t. in the n. w. of Hungary, near the borders of Moravia, 47 m. n. of Presburg, on the left bank of the March, with a pop. (1869) of 5,278. It is nearly in the form of a square, is surrounded by walls, has several Protestant and Roman Catholic churches, a Franciscan monastery, town-hall, etc., besides large manufactures of cloth. Good wine is produced in the vicinity, and hemp is largely grown.

SKAMA'NIA, a co. in s. w. Washington territory, having the Columbia river for its s. boundary separating it from Oregon; 2,650 sq. m.; pop. '80, 809—597 of American birth, 96 colored. It is drained by the Cathlapootle, Klikitat, and White Salmon rivers. The surface is mountainous. The hills are densely covered with forests, and the valleys furnish good pasturage, having a fertile soil. It contains mount St. Helens in the n. w. portion; height 9,750 ft.; and the Cascade range crosses it from n. to south. Co. seat, Cascades.

SKATE, the popular name of several species of ray (q.v.)—**THE COMMON SKATE** (*raia batis*), known in Scotland as the *b'ne skate* or *gray skate*, and in the south of England as the *tinker*, is plentiful on most parts of the British coasts; the breadth of the body is to its length in the proportion of about four to three; the snout sharp; a slight concavity in the outline between the snout and the extreme lateral angle of the pectoral fin; a short hard tubercle in front of each eye, and another on the inner side of each; a single row of spines commencing on the dorsal ridge near the origin of the ventral fins, and reaching along the tail as far as the first of the two small fins which it bears; the upper parts grayish brown, the belly dusky white with darker lines. It attains a large size, having been known to weigh 200 lbs.—**THE LONG-NOSED SKATE** (*R. rostrata* or *nucronata*) is remarkable for the elongation and sharpness of the snout. The upper surface is of a light lead color, the lower grayish white. The tail has a row of crooked spines. This species is not uncommon on the British coasts, and attains a large size. **THE SHARP-NOSED SKATE** (*R. oxyrhynchus*) has also a very sharp snout, but less elongated. It is thicker in proportion to its other dimensions than any of the other British species, and attains a very great weight. The line of the body from the snout to the extreme lateral expansion is waved. The tail is armed with three rows of spines. The upper surface is of a brown color; the color being lighter than in the other species, this is generally known in Scotland as the *white skate*. **THE FLAPPER SKATE** (*R. intermedia*) is very thin and broad; it has only a line of pointed tubercles on the tail; the upper surface is dark olive green, with numerous white spots. Skates are very voracious. They are often caught by lines, but the greater number of those brought to market are caught by trawl-nets. They are much esteemed for food in most countries, yet on some parts of the British coast they were until recently rejected as worthless.

SKATES—SKATING. Skates are small keels or blades of iron or steel which are placed under the soles of the feet for the purpose of enabling the wearer to glide along the surface of ice. They are usually fitted to pieces of wood carved into somewhat of a boat-like form, to which straps of leather are adjusted, to enable the skater to attach them firmly to his feet. Of late, in some improved skates, the wood has given way to metallic fittings, which are neater, and perhaps preferable; they are, however, liable to rust, and consequently to get out of order. In Britain skating is a favorite pastime in winter; and in England, and Scotland especially, is carried to a degree of excellence not known in other countries; the skaters study the most graceful curves, and the nicest possible balancing of the body, when going at great speed. In such countries as Holland and the more northern parts of Europe skating is used merely as a necessary means of locomotion among the laboring classes. The name of *roller-skate* has been adopted for a frame for the foot, fitted on small wheels or rollers. On a specially prepared surface, such as an asphalted floor, these roller-skates permit a smooth, gliding motion somewhat analogous to that of skating. Places for this amusement (called *rinking*) have of late years sprung up all over the country, and are known as *skating-rinks*.

SKEAT, WALTER WILLIAM, b. London, 1835; educated at King's college and Cambridge, graduating in 1853 with high honors; took orders but became lecturer in Christ's college, where he is now professor of Anglo-Saxon. He has devoted much study to Saxon and early English literature, and has edited many texts for the early English text society, for the Oxford press, and completed Kemble's Anglo-Saxon Gospels for the Cambridge synch. He was one of the founders and a director of the English dialect society.

SKELETON (Gr. *skeletos*, dry) is the term applied in anatomy to designate the hard parts or frame-work of animals. In the invertebrate animals the skeleton, except in the case of certain corals, is tegumentary or dermal, forming the outer hard and protective covering, as in the *echinodermata*, *mollusca*, and *crustacea*; and like the epidermis and its appendages, is non-vascular, and can only be increased by additions to its edges. This hard insensible covering serves to protect the animal from hurtful external influences, and to afford fixed points of attachment to the muscles which move the body and limbs; the muscles, however, always lying interior to the skeleton, and not clothing it as we see in the vertebrata. We scarcely ever observe amongst the invertebrata that the skeleton bears any definite relation to the nervous system, which is merely protected by it to the same extent as the other soft tissues. Moreover, in none of these animals are the hard parts composed of true bone.

In the vertebrate animals, although we find occasional cases of bone being deposited in various parts of the body, its most constant position is around the central masses of the nervous and vascular systems, with rays extending thence into the middle of the chief muscular masses, forming the bases of the limbs. "Portions of bone are also developed, to protect and otherwise subserve the organs of the senses, and in some species are found incasing mucous-ducts, and buried in the substance of certain viscera—as, e.g., the heart in the bullock and some other large quadrupeds. Strong membranes, called 'aponeurotic,' and certain leaders or tendons, become bony in some animals—as, e.g., the 'tensorium' in the cat, the temporal fascia in the turtle, the leaders in the leg-muscles in the turkey, the nuchal ligament in the mole, and certain

tendons in the abdominal muscles of the kangaroo, which, so ossified, are called the marsupial bones."—Owen's *Structure of the Skeleton*, p. 163. In some animals (e.g., the sturgeon, the crocodile, the armadillo), bony matter accumulates upon or near to the surface of the body, rendering the skin in some cases absolutely ball-proof.

In order to give a clear conception of the osseous system, prof. Owen classifies its various parts according to their prevalent position. The superficial or skin bones constitute the "dermo-skeleton" (Gr. *derma* skin); the deep-seated bones, in relation to the nervous axis and locomotion, form the "neuro-skeleton" (Gr. *neuron*, nerve); the bones connected with the sense-organs and viscera form the "splanchno skeleton" (Gr. *splanchnon*, a viscus or inward part); while those developed in tendons, ligaments, and aponeuroses are termed the "sclero-skeleton" (Gr. *skleros*, hard). In the arrangement of the various parts of the dermo, splanchno, and sclero skeletons no definite plan or law can be detected. The definite end or purpose gained by the position of the bony plates, cases, or rods, belonging to these skeletons is usually easily seen to be connected with the habits and well-being of the animals in which they occur, but the parts cannot be referred to one general type, as in the case of the neuro-skeleton. We will follow prof. Owen in taking the sturgeon and armadillo as examples of a dermo-skeleton, and shall condense the remarks which he makes on their outer covering. The head of the sturgeon is defended by a case of superficial bony plates, and the body by five longitudinal rows of similar plates, one extending along the mid-line of the back, one along each side of the body, and two along the belly, between the ventral and pectoral fins. These fishes habitually swim low and grovel along the bottom, turning up the mud and sand with their pig-like snout, and feeding on the decomposing organic substances carried down by strong and rapid currents. The heavy dermal osseous plates, regularly arranged in orderly rows along the middle and sides of the body, act as well-arranged ballast. The protection which their plate-armor affords them against the logs and stones hurled along their feeding-grounds, renders needless the ossification of the immediate case of the brain and spinal marrow, and consequently all the parts of the neuro-skeleton remain in the flexible, elastic, gristly state common to all the so-called cartilaginous fishes; the weight of the dermo-skeleton requiring that the neuro-skeleton shall be as light as possible, consistently with the defensive and sustaining functions which it is called to perform. The coat of mail in which the ganoid fishes of an early period were clothed was probably subservient to the same ends as the dermal plates of the sturgeon; and in most of these fishes, as in the sturgeon, the dermal bones are coated externally with a very hard material resembling enamel. In these extinct fishes, the plates are more close-set than in the sturgeon, overlapping each other, and being fastened together like tiles by a peg of one entering a socket in the next, and conversely.

In the armadillo the dermal bones are small, usually five or six sided, smooth internally, and variously sculptured externally—the pattern, however, being constant in, and characteristic of, each species. They are united together at their margins by rough surfaces, and collectively resemble a tessellated pavement. To allow of the requisite movements of the trunk of the armadillo, which have the power of rolling themselves into a ball, a certain number of transverse rows are interposed, having an elastic yielding attachment with one another, and with the anterior and posterior fixed parts of the trunk-armor; and by this arrangement, the head and limbs can be withdrawn beneath the central case, by the action of strong subcutaneous muscles. In the colossal extinct armadillo (the *glyptodon*) the trunk-armor was not divided by bands, but was composed of one immovable piece, covering the back and sides—an arrangement by which the dermo-skeleton would afford increase protection against falling timber, the attacks of other animals, etc.

The splanchno-skeleton is at first sight less apparent than the dermo skeleton. In most air-breathing vertebrates the larynx, trachea, and bronchial tubes contain a cartilaginous framework which sometimes becomes ossified; in fishes, and in the batrachians in the tadpole state, the gills are supported upon a cartilaginous or osseous framework, developed independently of the vertebral skeleton; and in many mammals the heart contains a bone that serves as a support for its muscular and ligamentous fibers. If to these parts we add the so-called "sense-capsules"—the bony cap which is found in the outer coat of the eye in many birds and most fishes; the hard bony envelope which surrounds the internal ear, and which subsequently, as the petrous portion of the temporal bone, becomes incorporated in most vertebrates with the neuro-skeleton; and the turbinate bones of the nose—and the teeth, we have the principal parts of the splanchno-skeleton. The sclero-skeleton requires no further explanation than that which has been already given; and we therefore proceed to what may be called the skeleton proper—the neuro-skeleton.

From the nature of the subject it is impossible to avoid the introduction of a considerable number of technical terms, which will probably be new, and will sound somewhat harshly to many of our readers; and as few writers can popularize a difficult subject more successfully than prof. Owen himself (unquestionably the greatest osteologist of the present age), we shall for the most part follow the history of the neuro-skeleton, which he drew up for the benefit of general readers in *The Circle of the Sciences*. A thoughtful examination of the skeleton of any vertebrate shows that it is

arranged in a series of segments, following and articulating with each other in the direction of the axis of the body, from before backward in brutes, from above downward in man. Each complete segment, called a "vertebra," consists of a series of osseous pieces arranged according to the plan shown in Figs. 2 and 3, so as to form a bony hoop or arch above a central piece for the protection of a segment of the nervous axis; and a bony hoop or arch beneath the central piece for the protection of a segment of the vascular system. The upper hoop, N, is called the "neural arch" (Gr. *neuron*, a nerve), and the lower hoop, H, the "hemal arch" (Gr. *hama*, blood); while their common center, C, is termed the centrum. The neural arch is formed by a pair of bones, *n, n*, called "neurapophyses" (Gr. *apophysis*, a projecting part or process), and by a bone, *ns*, sometimes cleft or bifid, called the "neural spine;" it also sometimes includes a pair of bones, *d, d*, called "diapophyses" (Gr. *dia*, across). The hemal arch is formed by a pair of bones, *pl, pl*, called "pleurapophyses" (Gr. *pleuron*, a rib); by a second pair, *h,*

FIG. 1.—TYPICAL VERTEBRA
(ideal).
(The signification of the letters is fully given in the text.)

FIG. 2.—ANOTHER MODIFICATION OF A TYPICAL VERTEBRA.
C, the centrum, giving off *d, d*, the diapophyses, and *p, p*, the parapophyses; the neural arch N, inclosing the spinal cord, is formed by *n, n*, the neurapophyses, and *ns*, the neural spine; the hemal arch H, inclosing the great centers of the circulation is formed by *h, h*, the hemapophyses, and *hs*, the hemal spine. From both the neurapophyses and the hemapophyses may be given off the zygapophyses, *z, z*. The lateral arches which may inclose the vertebral arteries *O, O*, are completed by the pleurapophyses, *pl*.

called "hemapophyses;" and by a bone, *hs*, sometimes bifid, called the "hemal spine." It also sometimes includes parts or bones called "parapophyses" (Gr. *para*, transverse). Bones, moreover, are developed, which diverge as rays from one or more parts of a vertebra. Prof. Owen divides the various parts of a vertebra into (1) the autogenous and (2) the exogenous parts. The autogenous parts are those which are developed from independent centers of ossification (q.v.), and are termed the elements of the vertebra; while the exogenous parts are those that grow from parts previously ossified, and are termed processes. The line between those two sets of parts cannot be strictly drawn, since parts which are usually exogenous are sometimes autogenous, and *vice versa*. The autogenous parts or elements are the centrum, C; the neurapophyses, *n, n*; the neural spine, *ns*; the pleurapophyses, *pl, pl*; the hemapophyses, *h, h*, and the hemal spine, *hs*; while the exogenous parts or processes are the diapophyses, the parapophyses; the zygapophyses (Fig. 2), *z, z* (Gr. *zygos*, a junction); the anapophyses (Gr. *ana*, backward); the metapophyses (Gr. *meta*, between); the hypapophysis (Gr. *hypo*, below); and the epapophysis (Fig. 1), *e* (Gr. *epi*, upon). These individual parts may be united with each other in various ways, and may occur in various degrees of development; sometimes they (or some of them) remain entirely disjointed even in the adult animal, while in other cases they are united into a single piece, so that their real distinctness can only be recognized by tracing the history of their development. In most instances some one or more of these parts will be found to be altogether deficient, while in other cases one set of parts is exaggerated to a great degree. Thus, in the third or parietal segment of the human skeleton the neural arch is much expanded, while the hemal one is contracted; while more commonly, as in the thoracic segment or vertebra of a raven, the hemal arch is much expanded and the neural one contracted; while sometimes again, as in the tail of the crocodile and of many other animals, both neural and hemal arches are simultaneously contracted. The segments are commonly simplified and made smaller as they approach the end of the vertebral column or axis, one element or process after another being removed until the vertebra is reduced to its centrum, as in the diagram of the archetypal vertebral skeleton. If we glance at the typical vertebra represented

in Fig. 2, we observe the diapophyses projecting above a canal that serves for the passage of a blood-vessel, and parapophyses which form the lower boundaries of this canal. These elements never attain any high development in mammals, birds, or reptiles; thus, in the human cervical vertebra, they form the two roots of the transverse process surrounding the foramen for the passage of the vertebral artery, while in the thoracic vertebra of the bird the diapophyses form the transverse processes, and the parapophyses, reduced to mere rudiments, form the articular surfaces with which the heads of the ribs come in contact. In fishes, however, they are much developed, and in the cod tribe are even larger and broader than the pleurapophyses or true ribs. The ordinary function of these lateral processes is to afford attachment to muscles, to protect the lateral vascular trunks (as in the case of the vertebral artery), and to give support to the pleurapophyses, *pl. pl.*, whose development varies extremely in different parts of the same vertebral column, as well as in different animals. Then, in the human cervical vertebra, they form the short bifid transverse processes which are ankylosed at their base to the diapophyses and parapophyses, which surround the vertebral canal. In the thoracic segments they are developed separately, and constitute the ribs which form the greater part of the circumference of the hemal arch. Proceeding to the consideration of the parts below the centrum, we often find the entire hemal arch wanting, as in the cervical and lumbar vertebrae of man and mammals; but in the tail of some mammals and of reptiles a hemal arch, protecting the caudal artery and vein, and closely resembling a neural arch, is found. It is in the thoracic region of mammals, birds, and reptiles that we find the greatest expansion of the hemal arch; the hemapophyses here articulating with the extremities of the ribs instead of with the centrum, and the arch surrounding the entire visceral cavity. In man and mammals the hemapophyses remain unossified, and are known as the cartilages of the ribs; but in birds and reptiles they are ossified, and constitute the sternal ribs. The hemal spine, *hs*, presents great variety of form, and is often altogether absent. In the mammalian thorax it occurs as a flat sternum; in birds the flatness is replaced by a prominent keel on the mesial line, so that a transverse section almost resembles a neural spine; while in reptiles, again, the hemal spine or sternum is flattened laterally, as in mammals. The hemapophyses and hemal spine are absent in the abdominal region of mammals and birds, but are continued backward in the saurians or lizard-like reptiles, whose hemal arch is, notwithstanding, incomplete, from the absence of pleurapophyses. In serpents the hemal arches are wanting through the whole trunk, the ends of the ribs being free; and in fishes generally the hemapophyses and hemal spine are absent or unossified.

Having noticed, as fully as our space permits, the modifications which the typical vertebra undergoes in various animals, and in different parts of the same animal, we now

FIG. 3.—DIAGRAM OF ARCHETYPE VERTEBRATE SKELETON, composed of the following parts:

- 1, Basioccipital; 2, Exoccipital; 3, Supraoccipital; 4, Parietocapital, constituting the neural arch of the first or occipital vertebra of the head (the occipital arch); 5, Basispinoid; 6, Alisphenoid; 7, Parietal; 8, Mastoid, constituting the neural arch of the second or parietal vertebra (the mesencephalic arch); 9, Presphenoid; 10, Orbitosphenoid; 11, Frontal; 12, Nasal, constituting the neural arch of the third or frontal vertebra (the prosencephalic arch); 13, Vomer; 14, Prefrontal; 15, Nasal, constituting the neural arch of the fourth or nasal vertebra (the rhinencephalic arch); 16, Petrosal, or otic capsule; 17, Sphenoid, or otic capsule; 18, Sphenoid, or otic capsule; 19, Ethmoidal, or olfactory capsule; 20, Palatine; 21, Maxillary; 22, Premaxillary, constituting the maxillary hemal arch; 23, 27, being its diverging appendages; 28, Tynaptic; 29-32, Mandibular or lower jaw, constituting the mandibular hemal arch; 33, 37, Opercular, being the diverging appendages of this arch; 38, Stylohyal; 39, Epiphyseal; 40, Ceratohyal; 41, Basihyal; 42, Glossohyal; 43, Urohyal, constituting the hyoidian hemal arch; 44, Branchiostegal, being its diverging appendages; 45, Suprahyal; 51, Scapula; 52, Coracoid; 53, Episternum; 54, Anterior member, constituting the scapular hemal arch, with its diverging appendages; 55, Clavicle; 56, Ilium; 57, Ischium; 58, Pubis, the hemapophysis of one of the lumbar vertebrae; 59, 63, Posterior extremity, constituting the hemal arch of the sacral vertebra skeleton, with its diverging appendages.

come to the more difficult subject of "the archetype vertebrate skeleton," which is made up of a series of vertebrae arranged in a continuous row. The accompanying scheme or diagram represents prof. Owen's conception of the common pattern or archetype of the vertebrate skeleton. It is difficult at first sight to see any resemblance between this figure and the human skeleton; but, in fact, the human skeleton, of all others, recedes the furthest from the common pattern; and if we turn to fishes, which were the first form of vertebrate life introduced into this planet, we find that they deviate the least from the archetypal idea. If proof be demanded that a given bone in the human skull is an element of a particular vertebra, it is afforded by tracing the same bone through its various modifications in mammals, birds, reptiles, and fishes, till the simple archetypal form is arrived at. The skull is found to be but a continuation of the backbone, and to consist of four vertebrae or segments, corresponding to the four consecutive enlargements of the nervous system, which we call the brain. These segments, reckoning them from behind forward, are termed the occipital, the parietal, the frontal, and the nasal segment. Each segment consists of a neural and a hemal arch.

The neural arches are:

N. I. Epencephalic arch (bones Nos. 1, 2, 3, 4 in figure). N. II. Mesencephalic arch (bones Nos. 5, 6, 7, 8 in figure). N. III. Prosencephalic arch (bones Nos. 9, 10, 11, 12 in figure). N. IV. Rhinencephalic arch (bones Nos. 13, 14, 15 in figure).

The hemal arches are:

H. I. Scapular arch (Nos. 50-52). H. II. Hyoidcan arch (Nos. 38-43). H. III. Mandibular arch (Nos. 28-32). H. IV. Maxillary arch (Nos. 20-22).

The jaws are the modified hemal arches of the first two segments; and the mouth opens at the interspace between these arches. The position of the vent varies (in fishes), but always opens behind the pelvic arch, S 62, 63, *p*, where this is ossified. Outlines of the chief ossified developments of the dermo-skeleton, in different vertebrates, are added by prof. Owen to the neuro-skeletal archetype; as, for example, the median horn, supported by the nasal spine, 15, in the rhinoceros; the pair of lateral horns developed from the frontal spine, 11, in most ruminants; the median folds, DI, DII, above the neural spines, one or more in number, constituting the dorsal fin or fins in fishes and cataceans, and the dorsal hump or humps in the buffaloes and camels; similar folds are sometimes developed at the end of the tail, constituting the caudal fin, C, and the anal fin or fins, A, of fishes.

It has been already remarked that bones which diverge as rays are formed from one or more parts of a vertebra. These "diverging appendages" are mainly connected with the hemal arches, and those which especially concern us are the pectoral appendages of the scapular arch, which become developed into fore-limbs or arms, and the pelvic appendages which are attached to their supporting hemal arch, 63, *hs*. If we examine the skull of a cod-fish, in which the bones have been arranged according to the segments or vertebrae to which they belong, we observe that the occipital vertebra has a widely expanded hemal arch, consisting of three pairs of bones with diverging appendages. The special names given by Owen to the various elements of that hemal arch, from above downward, are "suprascapular," No. 50; "scapula," No. 51; "coracoid," No. 52. The scapular arch thus formed supports and protects the heart or center of the hemal system, and in most fishes supports the pectoral fin, while in other animals the appendage that here becomes a fin is modified into a fore-leg, a wing, an arm, and a hand. Some of the special names originally employed in human anatomy are retained and applied to like parts in the pectoral fin of the fish; but it will be observed that prof. Owen designates each bone not only by a name but by a numeral. Of the two flat bones connecting the fin with the coracoid, the upper one is the "ulna," No. 54; the lower, the "radius," No. 55, the row of short bones joined with these are the "carpals," No. 56; beyond which are the metacarpals and phalanges. Ascending from fishes to reptiles, we find that, in the lower batrachia (as the *amphiuma*), the scapulæ are detached from the occiput, and that other important modifications have occurred. The coracoids are well expanded, three segments of the diverging appendage are ossified, and two of these segments are bifid, showing a simple beginning of the radiating multiplication of parts. The first segment is the seat of these modifications, which have acquired for it the special name of "humerus;" the two divisions of the next segment of the appendage are called "ulnar" and "radius;" the gristly mass is the carpus, and the two bony divisions are the digits or fingers. We have here got so distinct a rudimentary arm, separated from the head, although, according to the views propounded in this article, an appendage of the occipital segment of the cranium, that it is unnecessary to trace the further modifications that ensue, which lead finally to the arm and hand of man. It is only necessary to remark that in mammals, except amongst the non-placental orders, the coracoid bone is reduced to a mere rudiment, being known as a process of the scapula, and that its function—namely, that of keeping the shoulders apart—is performed by the clavicle, which, according to Owen, is the hemapophysis (58) of the first cervical vertebra (see fig. 3). With regard to the pelvic arch, we have only space to add that it must be regarded as the hemal arch of one or more of the pelvic vertebrae; and there is undoubted evidence to show that the pelvic and scapular arches are constructed on the same plan; the "ileum" answering to the scapula, the "ischium" to the coracoid, and

the "pubis" to the clavicle; and the same remark applies to the pelvic and scapular appendages.

"Of this," says Mr. Holden, probably our best authority on human osteology, "a student may rest assured that, however minutely he may have scrutinized the bones, he cannot understand them unless he knows something of the 'vertebrate archetype.' Without this knowledge he is like one who speaks a language fluently, but is ignorant of its grammar. The 'archetype' may be said to be the grammar of all osteology."

SKELETON (*ante*). The chemical composition, structure of bone and cartilage, and their relations, will be found in the articles **BONE**, **CARTILAGE**, **OSSIFICATION**, and **SKELETON**, *ante*. The human skeleton is composed of 200 distinct bones, exclusive of the 32 teeth and the three ossicles in each tympanum. See **EAR**, *ante*. It is conveniently, and not unnaturally, divided into four regions: 1. the skull, composed of 22 bones; 2. the trunk, composed of 54 bones; 3. the upper extremities, composed of 64 bones; and 4. the lower extremities, composed of 60 bones. In some respects it is more natural to count 62 bones in the lower extremities, including the hip bones, as they are connected with the hip joint in much the same manner as the clavicle and shoulder-blade are with the shoulder joint. These hip bones, however, form a part of a very distinct and functionally important part of the skeleton, viz., the pelvis, and for this reason it is well to keep this division of pelvis distinct. See **PELVIS**, *ante*. The skull is described under that title. The trunk may be divided into ribs, 24; vertebræ, 24; and pelvis, 4, the two lower bones of the spinal column, viz., the sacrum and coccyx, being included in the pelvis. If we include the vertebræ and sacrum and coccyx in one division, the spinal column, and the two hip bones with the lower extremities, we shall, in this view, eliminate the pelvic division. A consideration of the fact that the spinal nerves enter the sacrum and pass through orifices having the same anatomical relations as the orifices in the vertebræ, would point to the propriety of placing the vertebræ and the sacrum and coccyx together, but the physiological connection of these latter bones with the pelvis present sufficient reasons for the division here made. The trunk has also 1 sternum, or breast bone, and 1 hyoid, or tongue bone (see **HYOID BONE** and **TONGUE**), making in all 54 bones. The ribs are described under that title. They are shown in the cut, 12 on each side; 7 true and 5 false or floating ribs. The true ribs are joined to the sternum, which is seen to consist of 3 pieces, viz., the manubrium, the gladiolus, and the ensiform cartilage. The manubrium is the heart-shaped piece to which the internal ends of the clavicles or collar-bones are joined, their external ends being articulated with the shoulder-blade, or scapula, at the shoulder joint, as seen in the cut. See **CLAVICLE**, *ante*, and **SCAPULA**, *ante*. The gladiolus is the middle piece of the sternum, with which the 7 true ribs articulate. The ensiform cartilage is the small spatula-shaped piece seen pointing downward into the triangular space between the cartilages of the 5 floating or false ribs. The vertebræ are described in the article **SPINAL COLUMN**, *ante*. The pelvis (basin) is seen in the middle of the figure supporting the vertebral column, and forming with the thigh bones the hip joints. The upper extremity is divided into bones of the shoulder, 2, clavicle and scapula; of the arm, 1, the humerus (q.v.); of the fore-arm, 2, the radius and the ulna; of the wrist or carpus, 8; of the metacarpus, 5; and of the phalanges or finger bones, 14 = 32 bones in each upper extremity, or 64 in both. For a description of the bones of the upper extremity see **HAND**, *ante*. Passing to the lower extremities, we observe the femur (q.v.). Its condyles are seen to be partly covered in front by the knee-pan or patella (q.v.). Below this are seen the bones of the leg. The strong bone on the inner side of each leg is the tibia. Its upper expanded extremity or head forms with the condyles of the femur the knee joint, and its lower expanded extremity forms with the astragalus, one of the instep bones, the greater part of the ankle joint. See **LEG**, *ante*, and **FOOT**, *ante*. There are 7 bones in each instep, or tarsus, 5 in the metatarsus, and 14 in the toes, or phalanges, making in all 26 bones in each foot. These, with the leg, patella, and femur, comprise 30 bones for each lower extremity, or 60 for both.

SKELLIGS, THE, three rocky islands on the west coast of Ireland, about 8 m. west of Bolus Head, co. Kerry, in long. 10°32' west. The lights on the Great Skellig are the first visible to ships crossing the Atlantic.

SKELTON, JOHN, an early English satirical poet, is supposed to have been born about the year 1460, but whether in Norfolk or Cumberland is uncertain. He studied at both Cambridge and Oxford, and received from each the academical honor of laureate. His sovereign, Henry VII., appointed him tutor to the young prince Henry, afterward king Henry VIII.; and Erasmus, in allusion to his learning, styled him the light and grace of British scholars. At this time Skelton had produced some translations, written elegies on Edward IV. (1483) and the duke of Northumberland (1489), and was author of some stiff court masques and allegorical poems of little or no merit. He entered the church in 1498, and became rector of Diss in Norfolk, shortly after which he seems to have struck into that vein of original vernacular poetry, addressed to the multitude, for which he is unique among our elder bards, and which helped to fix our language. It consists in a flow of rattling voluble verse, unrestrained satire and jocularity, and a profusion of grotesque imagery mixed up with Latin and slang phrases. At times Skelton has gleams of bright fancy and snatches of pleasant description. Of this higher

class is his *Philip Sparrow*, being a poetical lamentation made by a young maiden (whose charms the poet describes with great gusto and minuteness) over the loss of a pet bird slain in a convent of black nuns at Carowe near Norwich. The most humorous of his pictures of low life—often coarse enough—are found in the piece entitled *The Tun-ing* [or brewing] of *Eynor Rummyng*, an ale-wife at Leatherhead in Surrey. This poem was highly popular, and was often reprinted in black-letter, garnished with a rude wood-cut representation of the fat hostess. His best satires are *Colin Clout*, and *Why Come Ye not to Court?* The former is a general satire on the clergy; and the latter, a virulent attack on cardinal Wolsey, whom the unscrupulous poet had previously flattered, but who had disappointed him of a prebend which he coveted. In this scurrilous lampoon, Wolsey is not only charged with arrogance, avariciousness, and incontinence, but is reminded of his “base original” and “greasy genealogy,” having been “cast out of a butcher’s stall.” The enraged cardinal ordered his libeler to be arrested, but Skelton took refuge in the sanctuary at Westminster, and received the protection of abbot Islip. From this retreat he did not dare to emerge, but continued silent under its sacred shelter till his death in 1529. The “pithy, pleasaunt, and profitable workes of maister Skelton, Poete Laureate” were collected and published in 1568, and reprinted in 1736. An edition, carefully edited by the rev. A. Dyce, was issued in 1843, in 2 vols. 8vo.

SKEPTICISM (Gr. *skeptomai*, “I consider”) strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering over subjects of thought. Skepticism is therefore the opposite of dogmatism (see **DOGMA**). The notion of “disbelief” is quite a secondary meaning of the term. Among the Greeks a *skeptikos*, “skeptical,” was originally only a thoughtful person, and the verb *skeptomai*, never acquired any other signification than “to consider.” But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision or cooler head are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled by the violent shock given to their reason to “doubt,” it may be to “disbelieve” what they hear affirmed by the multitude with indefensible emphasis of speech. Thus it is that in common parlance a skeptic has come to mean an infidel, and skepticism infidelity. But the field of thought in which skepticism properly so-called has preferred to exercise itself is not religion but philosophy. Philosophical skeptics in all ages and countries have generally denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. In ancient times Pyrrhon (q.v.), in modern, David Hume (q.v.), are the most characteristic representatives of this kind of skepticism.

SKERRIES, THE (skerry is a term for any isolated sea-girt rock), small islands about 2 miles off the n.w. coast of Anglesey, having a light-house 117 ft. high. See also **PENTLAND FIRTH**.

SKERRYVORE is the chief rock of a reef which lies about 10 m. s.s.w. of the s.w. point of the island of Tiree (q.v.), and 24 m. w. of Iona. This reef, which stretches from 8 to 10 m. in a w.s.w. direction, is composed to compact gneiss, worn smooth by the constant action of the waves, and was long a terror to mariners, having caused the loss of one ship annually for forty years previous to 1844. The northern light-house commission had long intended the erection of a light-house on Skerryvore, the only point of this dangerous reef which could afford the needful foundation; but the difficulty of landing on the rock, from the immense force (three tons to the superficial foot) with which the Atlantic waves beat upon it, caused the delay of the scheme till 1834, when preparations were made in earnest. The design and superintendence of the construction of the building were intrusted to Mr. Alan Stevenson, who commenced operations on the rock in 1838, following generally the mode adopted by his father, Mr. Robert Stevenson (q.v.), in the construction of the Bell rock (q.v.) light-house; and, in spite of occasional disasters from tempests, completed his work in 1844. The light-house is 138½ ft. high; at the base 42 ft., and at the top 16 ft. in diameter. The light, a revolving one, is produced by the revolution of eight large annular lenses round a lamp of four wicks, according to Fresnel’s first dioptric system, and can be seen at a distance of 18 miles. The cost of erection was close upon £87,000. Skerryvore light-house is nearly ½ higher than that on the Bell rock, and more than twice as high as the Eddystone. A small group of rocks belonging to this reef, and situated 3 m. westward of the light-house, is known as Stevenson’s rocks.

SKEW, a sloping water-table—as on the set-off of a buttress, the cope of a gable, etc. This term is more generally used in Scotland than in England. The large stone at bottom is called the skew-putt.

SKEW-BRIDGE, a bridge placed obliquely so as to cross a road or river at an angle not a right angle. Such bridges, built of stone, are not easy of construction, owing to the peculiar twisted forms which the voussoirs assume, and were scarcely ever used till the necessities of railway curves compelled their introduction. They are evidently a

great improvement on the old-fashioned mode of twisting a road, first to the right, and then to the left, in order to get the bridge at right angles to the place to be crossed. Since the introduction of iron girders as the supports of bridges, skew-bridges have become easy of construction, and are now quite generally used.

SKIBBEREEN, a market-t. of the county of Cork, Ireland, and situated in lat. 51° 34' n., long. 9° 16' w., distant from Cork 52 m. s.w. It is a place of little commerce, and almost entirely without manufactures. The pop. in 1871 was 3,695, of whom 3,209 were Roman Catholics.

SKID, in military and naval language, is any timber which is used as a base to keep one object from resting on another. Thus, a row of cannon in store will be kept from the ground by skids.

The term is also applied to the drag which is put on the wheels of carriages in going up hills, to prevent rolling backward.

SKID DAW, a mountain in Cumberland, near the center of the county; height, 3,022 feet. A few miles to the s. lie Derwent Water and the town of Keswick.

SKIMMER, a name applied to several species of the genus *rhynchops* of the gull family (*Laridae*, q.v.). The genus has the following characteristics: Bill longer than the head, nearly or quite straight, compressed laterally to the end. Lower mandible nearly one inch longer than the upper, and square at the point. Upper mandible grooved for the reception of the lower. The mechanism is remarkable, being adapted to cut like scissors, and the bird is sometimes called *scissor-bill*. The wings are very long and narrow, with the first quill the longest; tail moderate and forked; feet moderately long and slender, with an indented web; hind toe elevated, and claws curved and sharp. *R. nigra* is the *bec-en-ciseaux*, and *coupeur d'eau* of the French; shear-water, cut-water, skimmer, and black skimmer of the United States, and the *piscator* of the Chilians. The male is about 19 in. long; closed wings extend 4 in. beyond the tail; alar expansion, 44 inches. Length of the lower mandible four and a half inches; upper, three and a half; both mandibles red, tinged with orange and tipped with black. Upper part of the head, neck and back, and scapulars black; wings the same except the secondaries, which are white on the inner vanes, and also tipped with white. The forked tail having black feathers, broadly edged on either side with white; tail coverts white on the outer sides, black in the middle, front, cheeks, neck below the eye, throat, breast, and all the lower parts white. Legs and webbed feet red. The female is 16 in. long, with 39 in. wing expansion; plumage similar to that of the male, except the tail, which is white shafted and broadly centered with black. Mr. Nuttall says that it is a bird of passage in the United States, appearing in New Jersey, its most northern limit as he thinks, from its tropical quarters in early May; and he believes it passes the breeding season along the whole of the southern coast of the United States. Their nests have been found along the shores of Cape May about the beginning of June. They are made by scratching a hollow in the sand. There are usually three eggs, which are nearly two inches long by one in diameter; white with brown blotches, some of them large. Sometimes a bushel of eggs are collected from a single sand bar.

SKIN. Considered in its general physiological and histological (or textural) relations, the skin is merely a part of the great mucous system to which the mucous membrane and secreting glands also belong, and which consists of two essential elements—a *basement tissue*, composed of simple cutaneous membrane, and an *epithelium* of nucleated particles resting on it—while beneath the basement membrane are vessels, nerves, and connective tissue. See **EPITHELIUM** and **MUCOUS MEMBRANES**. In the skin, the hard and thick epithelium is termed *cuticle* or *epidermis*, and the true skin below it is termed the *derma* or *cutis vera*, and is chiefly formed of modified and very dense connective (or areolar or cellular) tissue.

The external surface of the skin formed by the cuticle is marked by furrows of different kinds. Some (termed furrows of motion) occur transversely in the neighborhood of joints, on the side of flexion; others correspond to the insertion of cutaneous muscles; while others, of quite another kind, are seen in aged and emaciated persons, and after the subsidence of any great distention of the integument; and besides these coarse lines, most parts of the skin are grooved with very minute furrows, which assume various courses in relation to one another. These minute furrows are most distinctly seen on the palmar aspect of the hand and fingers, and on the sole of the foot. The outer surface of the skin also presents innumerable pores for the discharge of the contents of the sudoriferous and sebaceous follicles, or the sweat and fat glands; and the modifications of epidermis known as hair and nails occur on the same surface.

The deep layer of the skin consists of connective tissue, in which both the white and yellow fibrous elements are considerably modified as to the proportions in which they occur, and smooth muscles are present in no inconsiderable quantity in some parts of the skin. Where great extensibility, with elasticity, is required, the yellow (elastic) element predominates; and where strength and resistance are specially required, as in the sole of the foot, the *cutis* is chiefly composed of a dense interweaving of the white (inelastic) element. The thickness and strength of this layer differ greatly in different parts, according to the amount of resistance required against pressure. The skin is

thicker on the hinder surface of the body than in front, and on the outer than on the inner sides of the limbs. "It is unusually thin over the flexures of the joints. It is particularly delicate in the eyelids, and proportionably so in some other situations where great mobility is demanded. In regions which are most subject to external pressure, as the soles of the feet, it is firmly united by very dense laminae to the sub-cutaneous fascia; and the intervals between these are provided with pellets of fat, forming a cushion, as an additional means of protection to the delicate organs it incloses and covers. Among the lower animals we may notice numberless examples of an analogous kind."—Todd and Bowman's *Physiological Anatomy and Physiology of Man*, vol. i. p. 407. The blubber of the whale merely represents, in a very exaggerated form, the layer of fat which generally occurs in the sub-cutaneous areolar tissue of man and most animals, serving as a soft bed on which the skin may rest, and gives the appearance of plumpness and symmetry to the outline of the body. It is on the external surface of the cutis that the *tactile papillæ*, or true organs of touch, are developed. Kölliker divides the true cutis into the "reticular" and "papillary" portions, the latter being the reddish-gray external superficial layer which contains the upper portion of the hair follicles and cutaneous glands, and whose most important element is these tactile papillæ. They are most abundant and largest in the palm of the hand* and the sole of the foot, while in the back and in the outer sides of the limbs they are almost entirely absent. They occur as small, semi-transparent, flexible elevations, which are usually conical or club-shaped in form; but in certain parts, as the palm of the hand, present numerous points (in which case they are termed compound papillæ).

The thickness of the true skin varies, according to Kölliker, from $\frac{1}{4}$ of a line to a line and a half. In its chemical characters it agrees with those of the connective tissue, of which it is principally composed. The gelatine which it yields on boiling is derived mainly from the white fibrous tissue, and it is probably this element which is principally concerned in the changes which skin undergoes in the process of tanning. Arteries from the sub-cutaneous connective tissue freely enter into the structure of the skin, and are distributed to the fat-lobules, the sudoriparous and sebaceous (presently to be described), the hair follicles, the papillæ, etc. In these several parts they terminate in a close network of capillaries. Those parts of the skin which border upon the epidermis are for the most part very freely provided with nerves, while in the deeper parts the nervous filaments are comparatively scanty. How they terminate is still a subject of dispute; but the view most generally adopted is that they end in loops.

The glands occurring in the skin next claim our consideration. They are the *sudoriparous* or *sweat glands*, the *sebaceous* or *fat glands*, and the *ceruminous glands*. The *sweat glands* exist in almost every part of the human skin. They lie in small pits in the deepest parts of the true skin, and sometimes entirely below the skin. Their orifices can be seen in the middle of the cross grooves that intersect the ridges of the papillæ on the hands and feet, their arrangement being here necessarily regular, while in other parts they are irregularly scattered. Their size and number in different regions of the skin correspond with the amount of perspiration yielded by each part; thus they are nowhere so much developed as in the axilla or armpit. In that part of this region, which in the adult is more or less covered with hair, they form a layer of a reddish color, of about an eighth of an inch thick. They are soft, and more or less flattened by their pressure on one another, being imbedded in delicate connective tissue, and covered and permeated with a net-work of capillaries. On isolating one of these glands, and highly magnifying it, it is found to consist of a solitary tube, intricately raveled, one end of which is closed, and hidden within the glandular mass, while the other emerges from the gland. The wall of the tube consists of an outer or *basement membrane*, with which the blood-vessels are in contact, and an *epithelium*, lining the interior, the former disappearing when the tube reaches the surface of the papillæ. The duct, on leaving the gland, follows a meandering and rather spiral direction through the reticular portion of the cutis to the interval between the papillæ, when it becomes straight; and it again assumes a spiral course in perforating the cuticle. It is not easy to explain how or why so beautifully regular a spiral form should be given to the cuticular portion of the duct, which is rather wider than the rest, the average diameter of the duct being $\frac{1}{17.09}$ of an inch.

The *sebaceous glands* are small whitish glands, which exist in almost every part of the skin, except the palms and soles, and are especially abundant in the scalp, face (the nose being particularly rich in them), and about the anus. They are usually connected with the hairs, and consist of a duct terminating in a blind pouch-like or pear-shaped extremity. The *basement membrane* of these glands is lined by an epithelium, in the particles of which are included granules of fatty or sebaceous matter, which, having become detached, constitutes the secretion. These glands are the seat of the parasite known as *acarus folliculorum*.

The *ceruminous glands* are brown simple glands, in external appearance like the sudoriparous glands, occurring in the cartilaginous portion of the external meatus of the ear. They yield an adhesive bitter secretion, which protects the membrane of the tympanum from the access of dust, insects, etc.

*In one square line of the palm of the hand, E. H. Weber reckons that there are 81 compound, and from 150 to 200 smaller papillæ, arranged in tolerably regular rows.

We shall conclude by taking a brief survey of the functions of the skin, omitting, however, its most important function, touch (q.v.). Regarded as a protective covering, the skin possesses the combined advantages of toughness, resistance, flexibility, and elasticity; the connective framework being the part which mainly confers these properties, although the epidermis co-operates with it. The subcutaneous layer of fat, and the modifications of epidermis in various forms, as hairs, wool, feathers, scales, etc., serve for the preservation of warmth, and occasionally (when they occur as claws, talons, etc.) as means of offense or defense. The skin is the seat of a twofold excretion, viz., of that formed by the sudoriparous glands, and that formed by the sebaceous glands. The fluid secreted by the sudoriparous glands is usually formed so gradually that the watery portions of it escape by evaporation as soon as it reaches the surface; but in certain conditions, as during strong exercise, or when the external heat is excessive, or in certain diseases, or when the evaporation is prevented by the application of a texture impermeable to air, as for example oiled silk, or the material known as mackintosh, or india-rubber cloth, the secretion, instead of evaporating, collects on the skin in the form of drops of fluid. When it is stated that the sweat contains urea, lactates, extractive matters, etc., and that the amount of watery vapor exhaled from the skin is, on an average, $2\frac{1}{2}$ lbs. daily (according to Valentin's observation), the importance of the sudoriparous glands as organs of excretion will be at once manifest. Moreover, there is reason to believe, from the experiments of Scharling, Gerlach, and others, that the importance of the skin as a *respiratory* organ is far from inconsiderable, very appreciable quantities of carbonic acid being exhaled hourly by the external surface of the body. In the amphibia, in which the skin is thin and moist, the cutaneous respiration is extremely active; and that the respiratory function of the skin in the higher animals is also considerable, is proved not only by measuring the excreted carbonic acid, but by the fact that if the skin is covered with an impermeable varnish, or if the body be inclosed, all but the head, in a caoutchouc dress, animals soon die, as if asphyxiated, their heart and lungs being gorged with blood, and their temperature before death gradually falling many degrees. The secretion of the sebaceous glands is a semi-fluid oily mass, which often solidifies into a white viscid tallow-like matter on the surface or in the glandular ducts, from which it can be removed by pressure, in a form resembling that of a small whitish worm or maggot. Under the microscope, cells containing fat, free fat mixed with epidermic scales, and sometimes crystals of cholesterin, are observed. Its chemical constituents, in addition to water, are a peculiar nitrogenous matter resembling casein, fat (consisting of palmitin and olein, soaps composed of palmitic and oleic acids), cholesterin, earthy phosphates, and chlorides and phosphates of the alkalis. Its purpose seems to be that of keeping the skin moist and supple, and by its oily nature, of hindering too rapid evaporation. Moreover, considered as an excretion, it must take a share in the purification of the blood.

The skin is, moreover, an organ of absorption: mercurial preparations, when rubbed into the skin, have the same action as when given internally. Potassio-tartrate of antimony, when rubbed into the skin in the form of ointment or solution, may excite vomiting, or an eruption extending over the whole body, and many other illustrations might be given. The effect of rubbing is probably to force the particles of the matter into the orifices of the glands, where they are more easily absorbed than they would be through the epidermis. It has been proved by the experiments of Madden, Berthold, and others, that the skin has the power of absorbing water, although to a less extent than occurs in thin-skinned animals, such as frogs and lizards. This fact has a practical application. In severe cases of dysphagia—difficult swallowing—when not even fluids can be taken into the stomach, immersion in a bath of warm water, or of milk and water, may assuage the thirst. Sailors, also, when destitute of fresh water, find their urgent thirst allayed by soaking their clothes in salt water.

The *diseases* of the skin, and their classification into genera and species, have occupied the attention of many of the most eminent physicians during the last century; but none of the proposed classifications are very satisfactory. The more important affections are noticed in special articles. See ECZEMA, and ECTHYMA.

SKINK, or SCINK, *Scincus officinalis*, a saurian reptile, found in the north of Africa, and in some parts of Asia. It is from 6 to 8 in. long, generally of a reddish-dun color, with darker transverse bands, a wedge-shaped head, and four pretty strong limbs. It has been in great repute for imaginary medicinal virtues from remote times; it was largely imported on this account into ancient Rome, and is still in high esteem in the east, dried skinks finding a ready sale in many places, as Cairo and Alexandria. There is almost no disease for which it has not been supposed to be a cure.—The skink belongs to the family *scincidae*, which is interesting as one of the connecting links between saurians and serpents. The skink itself is in general appearance quite lizard-like; but in some of the allied genera, the limbs become rudimentary, or nearly so. In some, one of the pairs is wanting; and even the slow worms (*anguis*) are by many naturalists reckoned in this family, in which the limbs are not manifest externally, although they may be observed on careful dissection. Among the genera in which the four limbs are all externally manifest, although very small and imperfect, is *seps*, sometimes made the type of a separate family, *sepsidae*, in which the body is much elongated and snake-like.

SKIN-MOTH, a name given to certain coleoptera which attack skins and furs, and prepared animals in zoological collections. The most common are *dermestes vulpinus*, *dermestes lardarius*, and *anthrenus muscorum*. The two first mentioned of these insects are less than a quarter of an inch long, and are very destructive, both in the larval and imago condition. The *anthrenus* is only about one-tenth of an inch long. The best antidote for them all is benzine. As a preventive the skins should be treated with arsenic during the tanning or preparing process.

SKINNER, THOMAS HARVEY, D.D., LL.D., 1791-1871; b. N. C.; graduated at Princeton college in 1809; studied law for 18 months; was licensed to preach in 1812; was colleague of Dr. Janeway, Philadelphia, 1813-16; pastor of the Fifth Presbyterian church, Philadelphia, 1816-32; professor of sacred rhetoric at Andover theological seminary, 1832-35; pastor of Mercer st. church, 1835-48; professor of sacred rhetoric and pastoral theology in Union theological seminary, New York, from 1848 to his death. He published *Religion of the Bible*; *Aids to Preaching and Hearing*; *Hints to Christians*; *Religious Life of Francis Markoe*; Vinet's *Pastoral Theology* and *Homiletics* (translated); *Discussions in Theology*.

SKIPS, large square baskets, lined with leather or skin, used in spinning-mills for carrying the bobbins of yarn; sometimes they are made entirely of thick hides. Wood or basket-work would be apt to catch and break the delicate threads.

SKIPTON, a market t. of England, county of York, is finely situated in a broad and fertile valley, near the river Aire, about 38 m. w. of York, and 16 n.n.w. of Bradford. Skipton carries on manufactures of cotton and woolen goods, and is a station on the Leeds and East Lancashire railway and on the Midland line. Pop. '71, 6,042.

SKIRMISHERS are soldiers operating in loose array, two together—i.e., front and rear, with a lateral distance of about six paces between the files. When the army advances, the ground in front, and for some distance on each flank, is usually covered by skirmishers, to prevent surprise. If cavalry come suddenly on them, they rush together, and form small squares, called rallying squares. Skirmishers fire independently at their own discretion; but the rule is, that one of the two men composing a file should always have his rifle loaded. Orders are communicated by the sound of bugle.

SKIRRET, *Scum skarum*, a perennial plant of the natural order *umbellifera*, a native of China and Japan, but which has long been cultivated in gardens in Europe for the sake of its roots, which are tuberous and clustered, sometimes 6 in. long, and of the thickness of the finger. They are sweet, succulent, and nutritious, with a somewhat aromatic flavor, and when boiled, are a very agreeable article of food. A kind of spirituous liquor is sometimes made from them. Good sugar can also be extracted. Skirret was at one time more cultivated in Britain than it is at present, although there seems to be no good reason for its having fallen into disrepute. It is propagated either by seed or by very small offsets from the roots. It has a stem of 2 to 3 ft. high; the lower leaves pinnate, with oblong-serrated leaflets, and a heart-shaped terminal leaf, the upper ones ternate with lanceolate leaflets.

SKIETING, the board round the bottom of the walls of rooms. When large, it is called a base-plinth.

SKITTLES, a game very popular in England among the frequenters of public-houses. It is usually played in a covered shed, called a skittle alley, about 60 ft. in length. The skittles are made of hard wood, and they are placed upon the floor of the shed in a square with one corner toward the player. The player throws a wooden ball, and tries to knock down the whole of the skittles in a given number of throws. The rules of the game vary in different places. It is sometimes called "ninepins," from the number of skittles used.

SKOPIN', a t. of Russia, government of Riazan, and 160 m. s.e. of Moscow, is situated on the Verda, a tributary of the Oka, which is itself a tributary of the Volga. It has manufactures of Russian leather, and a trade in corn and cattle. Pop. '67, 9,511.

SKU A, or **SKUA GULL**, *Lestrís*, a genus of birds of the family *laridae*, also known by the name JÄGER (Ger. hunter), and differing from the gulls in having the upper mandible more hooked at the tip, and the nostrils larger and further forward in the bill, the base of which is covered with a cere. The skuas are bold and powerful birds, and generally obtain their food by pursuing gulls or terns, and causing them to disgorge the fish which they have captured, which they dart upon and seize in the air. They also eat eggs and small birds. The **COMMON SKUA** (*L. cataractes*) is fully 2 ft. in length, of a brown color, with lighter streaks on the head and neck. It inhabits the northern seas, and breeds in some of the Shetland isles.

SKULL. The skull is divided into two parts, the cranium and the face. In human anatomy, it is customary to describe the former as consisting of 8 and the latter of 14 bones; the 8 cranial bones, which constitute the brain-case, being the *occipital*, *two parietal*, *frontal*, *two temporal*, *sphenoid*, and *ethmoid*; while the 14 facial bones are the *two nasal*, *two superior maxillary*, *two lacrymal*, *two malar*, *two palate*, *two inferior turbinated*, *vomer*, and *inferior maxillary*. The bones of the ear, the teeth, and the Wormian bones are not included in this enumeration. The morphologist, however, who wishes to trace

out the fundamental similarity of type in the structure of the various modifications of the vertebrate skull, will not be content with this arrangement, in which, as, for example, in the occipital, temporal, and sphenoid bones, the human anatomist considers as a single bone an osseous mass consisting primarily in man, and persistently in some of the lower vertebrates, of several distinct pieces or elements. Postponing to the close of this article any remarks on the structure of the vertebrate skull generally, we shall proceed to notice the ordinary anatomical relations of the human skull. The development of the skull is a subject of great interest, not only in itself, but as throwing light on many points which the study of the adult skull would fail to explain. At a very early period of fetal existence, the cerebrum is inclosed in a membranous capsule external to the dura mater, and in close contact with it. This is the first rudiment of the skull, the cerebral portion of which is consequently formed before there is any indication of a facial part. Soon, however, four or five processes jut from it on either side of the mesial line, which grow downward, incline toward each other, and unite to form a series of inverted arches, from which the face is ultimately developed. Imperfect development or ossification of these rudimentary parts of the face gives rise to the peculiarities known as "hare-lip" and "cleft-palate," or in very extreme cases to the form of monstrosity termed "Cyclopean," in which, from absence of the frontal processes, the two orbits form a single cavity, and the eyes are more or less blended in the mesial line.

The following is a brief summary of the succession of events that occur in the ordinary or normal development of the skull. Cartilage is formed at the base of the mem-

Fig. 1.—Side view of Human Skull.

1, Frontal bone; 2, Parietal bone; 3, Occipital bone; 4, Temporal bone (squamous portion); 4*, Do. (mastoid portion); 5, Sphenoid bone; 6, Malar bone; 7, Nasal bone; 8, Superior maxillary or jaw bone; 9, Inferior maxillary or jaw bone.

Fig. 2.

1, Anterior fontanelle; 2, Posterior fontanelle; 3, Sagittal suture; 4, 4, Coronal suture; 5, Lambdoidal suture; 6, 6, Parietal bones; 7, 7, Two halves of the frontal bone, still ununited; 8, Occipital bone.

branous capsule, which has been already described as thrown round the brain, and capable of enlarging with it. This is speedily followed by the deposition of ossific matter at various points of the capsule, which soon becomes converted into flakes of bone, which afford protection for the brain, while the intervening portions, which remain membranous, permit the skull to expand as its contents enlarge. The formation of these bony flakes on the convexity of the cranium is soon followed by the appearance of osseous nuclei in the cartilage at the base, corresponding to the future occipital and sphenoid bones. Lastly, the various bones, some originating in membrane, and some in cartilage (as described in the article *OSSIFICATION*), approach one another by gradual enlargement, and become united in various ways, so as to form a continuous, and ultimately an unyielding bony case, which, in the words of Dr. Humphrey, "is admirably adapted for the defense of the brain, for the accommodation of the organs of special sense, and for the attachment of the ligaments and muscles by which the skull is supported and moved on the spine."—*The Human Skeleton*, p. 185. At the period of birth most of the principal bones have grown into apposition with their neighbors, forming the *sutures* (q.v.), but one large vacancy remains at the meeting-point of the parietal and frontal bones, which is termed the anterior fontanelle,* which does not close till the second year after birth, and sometimes remains open much longer. The deficiency of the osseous brain-case at this position not only facilitates the act of delivery, but also acts, according to Humphrey, to some extent like a safety-valve during the first months of infantile life, at which time the brain bears an unusually large proportion to the rest of

* So called from the pulsations of the brain, which may be here seen, resembling the rising of water at a spring or fountain. There are two fontanelles in the mesial line, as shown in Fig 2, and two lateral fontanelles on either side, as shown in Fig. 3.

the body, and is liable to sudden variations of size from temporary congestion, sudden wasting of its substance, and other causes. The sutures remain distinct long after the closure of the fontanelles, and probably serve a purpose both in permitting an increase of the size of the cranium by the growth of the bones at their edges (although the enlargement of the cranial cavity does not entirely depend upon this growth at the edges), and in diminishing and dispersing vibrations from blows, and thus contributing to the security of the brain.

The number of centers of ossification in the skull is tolerably constant; each bone having a certain number. (Thus the occipital has 7 centers, the temporal 5, the sphenoid 12, etc.; the total number being about 59). In addition to these, centers frequently occur in the course of the sutures, giving rise to independent pieces, which are called the *ossa triquetra*, or the *Wormian bones*. They are regarded by Humphry as stop-gaps, developed in the membranous covering of the brain, when the extension of the regular osseous nuclei is likely, for some reason, to be insufficient to cover in the cranial cavity; and this view is supported by the observation that, in cases of rickets and hydrocephalus, the Wormian bones are especially abundant.

After the sutures have been formed, and the skull has acquired a certain thickness, a process of resorption commences in the interior of the bones, and reduces the originally dense structure to a more or less cellular or cancellated state. The interior thus altered is called the *diploe*, and by this change the weight of the skull is much diminished, while its strength is scarcely affected.

The *diploe* usually begins to be apparent about the tenth year, and is most developed in those skulls which are thickest. Dr. Humphry has observed it to be especially thick in idiots, and where the brain is small. "Hence," he observes, "the propriety of the term *thick-headed*, as a synonym for *stupid*, derives some confirmation from anatomy." A continuation of the same process of resorption, which causes the *diploe*, gives rise to the formation of the cavities known as the frontal and sphenoid sinuses. The formation of the *diploe* divides the walls of the cranium into three layers, viz., an outer tough layer; an inner dense, brittle, and somewhat glass-like layer, known as the vitreous table or layer; and the intervening cancellous *diploe*. The vitreous table being more brittle than the outer layer, is apt to be fissured to a greater extent in fracture of the skull; and is even sometimes broken while the outer layer, which received the blow, has remained entire; although the *diploe* must have great power in lessening the concussions transmitted from the outer to the inner layer of the skull. The growth of the skull after the seventh year proceeds slowly, but a slight increase goes on to about the age of twenty. The skull-bones are freely supplied with blood from arteries which pass from the dura mater internally and the pericranium externally, through the numerous foramina observed on both surfaces; the blood being returned by veins which take various directions.

The fact that concussion of the brain scarcely ever proves fatal, unless there is also fracture of the skull, affords the most distinct evidence that the skull is constructed in such a manner that so long as it maintains its integrity, it is able to protect its contents from serious lesion. This marvelous protective power is due to its rounded shape whereby its strength is increased, and in consequence of which blows tend to glide off it, without doing material damage. Moreover, the curved lines or ridges which may be traced round the skull tend to strengthen it. The weakest part of the skull is at the base. Hence, notwithstanding its removal from exposure to direct injury and the protection afforded by the soft parts, fracture takes place more frequently at the base than at any other part of the skull, fracture often taking place here even when the skull was not broken at the part struck. There are two points in the architecture of the bones of the face which deserve especial notice, viz., (1) the great strength of the nasal arch, and (2) the immobility of the upper jaw, which is fixed by three buttresses, the nasal, the zygomatic, and the pterygoid.

The base of the skull, whether seen from within or from below, presents many objects of physiological interest in relation to the nervous system. As seen from within, the base presents on each side three fossæ, corresponding to the anterior and middle lobes of the cerebrum and to the cerebellum. These fossæ are marked, as is the whole skull-cap, by the cerebral convolutions, and they contain numerous "foramina" and "fissures" which give passage to various sets of nerves and blood-vessels. The external or outer surface of the base of the skull, if we consider it from before backward, is formed by the palate processes of the superior maxillary and palate bones; the vomer; the pterygoid and spinous processes of the sphenoid and part of its body; the under surface of the temporal bones, and by the occipital bone. The most important of the parts which it presents are named in the description of Fig. 3.

The anterior region of the skull, which forms the face, is of an irregularly oval form, and the bones are so arranged as to inclose the cavities for the eyes, the nose, and the mouth, and to give strength to the apparatus for masticating the food. The size of the face and the capacity of the cranial cavity stand in an inverse ratio to one another, as may be readily seen by comparing vertical sections (through the mesial line) of human and other mammalian skulls; and if, in place of mammalian skulls, we take skulls of lower vertebrates (the crocodile, for example), this ratio is far more striking. In man the face is at its *minimum* as compared with the cranial cavity, chiefly in consequence

of the facial bones being arranged in a nearly vertical manner beneath the cranium, instead of projecting in front of it. The human face is also remarkable for its relatively great breadth, which allows the orbits for the reception of the eyes to be placed in front instead of on the sides of the head, and renders their inner walls nearly parallel. "This parallelism," says Dr. Humphry, "in man is associated with the parallelism of the optic axes, and contributes to that clear, accurate, and steady vision which results from the ready convergence of the eyes upon every object." Each orbit is of a pyramidal form, with the apex behind, and is composed of seven bones—viz., the frontal, ethmoid, lachrymal, sphenoid, superior maxillary, malar, and palate, which last contributes very slightly to the human orbit, but is an important constituent in the orbit of many animals. The nasal cavities have been sufficiently described in the article Nose.

The different varieties of mankind present certain well-marked and characteristic peculiarities in the form of the skull. There are *three typical forms* of the skull which seem to be well established from the examination and comparison of a large number of crania—viz., the *prognathous*, the *pyramidal*, and the *oval or elliptical* cranium. When the upper jaw slopes forward, the insertion of the teeth, instead of being perpendicular, is oblique. A skull with this peculiarity is *prognathous* or *prognathic* (Gr. *pro*, forward, and *gnathos*, a jaw); the opposite condition being termed *orthognathous* or *orthognathic* (Gr. *orthos*, upright). The negro of the Guinea coast and the negro of Australia present the prognathous character in its most marked form. The pyramidal form is characterized by the breadth and flatness of the face, which, with the narrowness of the forehead, gives this shape to the head. The Mongolian and Esquimaux skulls belong to this type. The oval or elliptical type is that which is presented by the natives of western or southern Europe, and which is not distinguished by any particular feature so much as by the absence of the longitudinal projection of the first type, or the lateral projection of the second, and by a general symmetry of the whole configuration. The length of the skull, which to a great degree corresponds to the degree of development of the posterior cerebral lobes, has been taken by the late prof. Retzius as a basis of classification. He arranges all the varieties of mankind into two great classes—the *dolicocephale*, or *long-heads*, whose cerebral lobes completely cover the cerebellum; and the *brachycephale*, or *short-heads*, in whom the cerebral lobes do not extend so far. Each of these classes contains *orthognathous* and *prognathous* varieties. See ETNOLOGY.

It has been already stated in the article SKELETON that the skull is only the anterior prolongation of the backbone, and that it consists of four vertebrae or segments, corresponding to the four consecutive enlargements of the nervous system which ultimately form the brain—viz., the *rhinencephalon*, the *prosencephalon*, the *mesencephalon*, and the *opencephalon*—embryonic segments giving rise to the nerves of smell, sight, taste, and hearing. These four vertebrae, taken from behind forward, are termed the occipital, the parietal, the frontal, and the nasal vertebrae. For the anatomical evidence by which these cranial vertebrae are resolved into the essential elements of a vertebra, as described in the article SKELETON, we must refer to prof. Owen's various works on the skeleton, or to the admirable summaries of them contained in Humphry *On the Human Skeleton* (for which we are indebted to many of the details introduced into this article), and to Holden's *Human Osteology*. There has been much discussion as to who originated "The Theory of the Vertebrate Skull." The claim undoubtedly rests between Goethe, the great poet, and Oken, one of the most original and distinguished comparative anatomists of the early part of the present century. We believe the truth to be that the idea of the true nature of the skull flashed across the poet's mind in 1790, but that nothing definite was published on the subject till 1807, when Oken independently arrived at and promulgated similar views. Our limited space has prevented us from noticing the skull of birds, reptiles, or fishes. On these subjects the reader is referred to Huxley's *Lectures on Comparative Anatomy*, 1864, in which the structure and development of the human skull, as well as the skulls of all the lower vertebrate animals, are most copiously and philosophically discussed.

Fracture of the skull is an accident of such importance as to demand a special paragraph. As already remarked, fracture may take place either in the vault or at the base of the skull. We shall first consider *fractures of the vault*. Here the fracture is usually direct, the bone giving way at the point at which it was struck, and the result being either a simple fissure or a breaking of the bone into several fragments (a comminuted fracture). Although fractures may be limited to the outer or to the inner surface of the skull, they most commonly extend through the whole thickness, and the broken bone is generally driven inward; and the most ordinary form of fracture with depression is that in which several fragments of a somewhat triangular form have their points driven down and wedged into each other, while their bases remain on a level with the surrounding bone. There are no signs by which we can in all cases recognize the existence of fracture of the vault. "Fissures," says Mr. Prescott Hewett, "involving the whole thickness of the vault of the skull, constantly exist without ever having been suspected during life; and even an extensive and comminuted fracture, with great depression of the fragments, may, and often does, escape notice when the broken bone lies hidden under the temporal muscle or under a large extravasation of blood."—Holmes's *System of Surgery*, vol. ii. p. 116. When, however, the fracture is accompanied by a wound leading down to the bone it may, in general, be easily detected. With regard

to treatment, it is now an established rule that simple fractures of the skull with depression, and without symptoms, are to be let alone. The depression may be so marked as to be easily detected; and yet so long as there are no symptoms all operative interference, of whatsoever form, is carefully to be avoided."—Prescott Hewett, *op. cit.* If, however, there be a wound leading down to the bone in a depressed fracture without symptoms, immediate operative interference is called for. When a depressed fracture is accompanied by primary brain-symptoms, an operation for the purpose of raising or removing the depressed fragments is usually necessary. If, however, the fracture is a simple one, and the symptoms are not urgent, milder remedial agents, as bleeding, purging, and low diet may be first tried. Cases occasionally occur in which very urgent symptoms of cerebral pressure persist for a long time, and are relieved at once on the pressure being removed. A remarkable case is recorded by Cline (*Medico-Chir. Rev.*, vol. i. p. 471), in which a sailor remained in a state of unconsciousness for 13 months in consequence of a wound causing fracture and depression of one of the parietal bones. Cline trepanned the part and elevated the bone, and on the evening of the same day, the sailor sat up in bed, and though at first stupid and incoherent, soon became rational and well, upward of a year having elapsed in which his life was a complete blank.

Fractures of the base may be direct or indirect, but in most cases are indirect, that is to say, the bones give way at a point remote from the seat of the blow, as has been already shown. At certain parts, however, the bones of the base are so thin that if direct pressure be brought to bear upon them they readily give way. Thus scissors, slate-pencils, tobacco-pipes, etc., have often been thrust into the skull through the orbits or the nostrils, and these wounds are very serious, from the readiness with which the brain may be thus injured. The only symptoms that can be depended upon as indicating a fracture of the base of the skull are connected either with an escape of the substance of the brain, or blood, or watery fluid, or with an injury done to the nerves as they emerge at the base. Out of 32 cases of fractured base observed by Hewett, bleeding from the mouth or nose occurred in 14 and bleeding from the ear in 15 cases. A copious watery discharge from the ear was, until very recently, regarded as a diagnostic sign of fracture of the base; and there can be no doubt that when such a discharge of cerebro-spinal fluid occurs either from the ear or nostrils, that it *most probably* is connected with fracture. Operative interference is very seldom required in these fractures, our treatment being directed not against the broken bones, but against the accompanying cerebral lesions.

SKULLCAP, a genus (*scutellaria*) of herbs of the mint family (*labiate*). The generic characters are: calyx bell-shaped when in flower, two-lipped, the upper lip with a helmet-like appendage; calyx splitting at the base at maturity, the upper lip usually falling away; corolla having an elongated curved ascending tube, dilated at the throat, two-lipped; stamens four; anthers approximate in pairs and bearded. The following species grow in the United States: *S. versicolor*, from 1 to 3 ft. high, stem erect, leaves heart-shaped; river banks from Pennsylvania to Wisconsin and southward: *S. saxatilis*; stem weak, from 6 to 18 in., sometimes having runners; leaves heart shaped, crenate, from 1 to 2 in. long; growing on moist shady banks in southern Ohio, Virginia, and Kentucky, and on mountains farther south: *S. canadensis*; 2 to 4 ft. high, stem-branched above, with panicle, many-flowered racemes; lance-ovate, crenate leaves, whitish, with fine soft down; upper lip of corolla shorter than lower; rich soil from Pennsylvania to Illinois and southward: *S. serrata*; stem from 1 to 3 ft. high, simple, with single, loosely flowered racemes; leaves ovate, serrate, and acuminate at both ends; corolla one inch long, lips equal; growing in woods from Pennsylvania to Illinois and southward: *S. pilosa*; stem simple, 1 to 3 ft. high; leaves oblong-ovate, crenate; racemes short; corolla rather narrow; growing on dry ground in southern New York to Michigan and southward: *S. lateriflora* is a species which has been used as a quack medicine in hydrophobia, and bears the common name of mad-dog skullcap. It has a smooth, upright stem, much branched; 1 to 2 ft. high; leaves lanceolate-ovate, coarsely serrate; growing in wet, shady places in many parts of the United States. Other species are *S. integrifolia*, *S. nervosa*, *S. parvula*, and *S. galericulata*.

SKUNK, *Mephitis*, a genus of quadrupeds of the weasel family (*mustelide*), but departing very considerably from the typical characters of that family, and approaching to the badgers and gluttons in general appearance, in habits, in the lengthened claws of the fore-feet, in the plantigrade hind-feet, and in some of the teeth. There are six incisors and two canine teeth in each jaw, eight molars in the upper, and ten in the lower; the teeth generally resemble those of the polecat. Skunks depend very much for defense against enemies on an excessively fetid fluid, which is secreted by glands near the anus; and when assailed, they turn the rump toward the assailant, elevate the tail, and discharge this fluid with considerable force. The odor proceeding from it, even when a dead skunk has been flung into an inclosure, has been known to cause nausea to the inmates of an apartment with closed windows at the distance of 100 yards. So confident does the skunk seem of the efficacy of its peculiar mode of defense, that it permits itself to be approached till it is just on the point of being seized, which, however, is only attempted by the inexperienced, when the battery is discharged. It is almost impossible to remove the odor from clothes. Dogs flee at once, and rub their

noses on the ground till they bleed. Dogs that are aware of the skunk's powers, however, kill it by leaping upon it suddenly, and in such a way that they are not exposed to danger. There is much uncertainty concerning the species of skunk, as the colors vary considerably even in the same species; but there is no doubt of the existence of a number of species. They are found only in America, where they are very widely distributed from Hudson's bay to the strait of Magellan. The COMMON SKUNK (*M. Americana* or *varianus*) is about the size of a cat, generally black or blackish brown, with white streaks along the back. It inhabits burrows which it makes in the earth, feeds on mice, frogs, etc., and also on insects and fruits; and sometimes enters houses to plunder store-rooms, where, if it is suddenly alarmed, everything is tainted with an intolerable odor. White streaks on the back, one or more, are very characteristic of this genus.

SKUNK CABBAGE, sometimes called dracontium, and by the Germans, *stinkende drachenwurzel*. It is the *symplocarpus fetidus*, a plant belonging to the arum family, growing in bogs and moist ground in many parts of North America. It blossoms in April and May. The spathe, which precedes the leaves, is hooded, shell form, pointed, rather fleshy, of a variegated purplish brown and yellow color, inclosing a short oval spadix, which is densely tessellated with fleshy flowers, and enlarges to a spongy mass, which superficially covers the globular seeds. The leaves are radical, 18 to 24 in. long, on short leaf-stalks, smooth, ovate, heart-shaped. All parts of the plant emit a fetid odor, especially when bruised, which has some resemblance to the fetid secretion of the skunk. The fruit is ripe in September, forming a roughened, globular mass 2 or 3 in. in diameter, containing many round seeds nearly half an inch in diameter, filled with a solid fleshy embryo. Skunk cabbage, or dracontium, taken internally produces vertigo, nausea, and frequently vomiting. It has been used in hysteria, chorea, and spasmodic asthma, but it is probably much less efficient than many other medicines, and is not often used by the profession. The root is the part used, and should be collected early in the spring.

SKYE (Gaelic *Skianach*, winged), the largest of the Scottish islands after Lewis, and the most northerly of the group known as the inner Hebrides, forms part of the county of Inverness, from the mainland of which it is separated by a channel scarcely half a mile in breadth at its narrowest point, Kyle Rhea. Its extreme length, from s.e. to n.w., is 47 m.; breadth, from 7 to 25 m.; but on account of the extraordinary number of inlets at all parts of the island, no point is above 4 m. from the sea. Area, 547 sq.m.; pop. 71,17,330. Skye is for the most part mountainous and moory, but it contains some pleasant tracts of arable and pasture land, and one considerable plain, formerly the bed of a lake, in the parish of Kilmuir. The principal mountains are the Coolin Hills, which stretch irregularly chiefly from s.w. to n.e., culminating in the sharp peak of Scoor-nan-Gilleann (3,183 ft.) above Sligachan. The singularly jagged outline of these remarkable hills arrests the eye at a great distance, and forms the dominant feature in the view at almost every point around the island, and far out at sea. The most famous scene in this region is loch Coiruisg, a small fresh-water lake near the head of the bay of Scavaig, all but encircled by frowning ridges of rock, shooting up at some points to the height of 3,000 feet. It has been powerfully depicted by sir W. Scott in *The Lord of the Isles*. Glen Sligachan, extending from the head of the loch of that name about 9 m. to Caumsunary, is by many as the grandest glen in the highlands. The scenery of Cuiraing, near the n. of the island, has been truly styled "unique." The coast-scenery of Skye is for the most part highly picturesque, and in many places very grand. Between Rhu-nam-Brarin and loch Staffin, the coast-line presents magnificent basaltic formations, on a scale of magnitude considerably exceeding the giants' causeway or Staffa. Over these cliffs descend many remarkable waterfalls, and their bases are frequently worn into deep caves, some of which are of historical interest. One near Portree afforded a refuge to prince Charles; another, on the w. coast, was the temporary prison of lady Grange. The largest arms of the sea are loch Bracadale, loch Dunvegan, and loch Snizort; and the chief harbors are those of Portree, Uig, Grishernish, Lochbay, Dunvegan, Pooltiel, and Harport.

The coasts abound in fish, the most important being herring, cod, ling, and saithe. Good oysters are found in several places. The herring fishery is prosecuted in the season in all the bays: the cod and ling fishery is chiefly confined to loch Dunvegan and loch Snizort; and the salmon fishery to Portree and the e. coast. Lobster-fishing is also carried on to a considerable extent. There are no rivers of any magnitude; but salmon and sea-trout are got in some of the principal streams, at Skcabost, Portree, Ose, Hammer, &c. The fresh-water lakes are also small, and few in number. Deer are not numerous, nor are grouse. An excellent breed of hardy ponies used to be extensively reared, but the cultivation of sheep now engrosses almost exclusive attention from farmers. The climate of Skye is exceedingly moist, the days throughout the year during which no rain falls being generally few in number. A register kept at Portree shows the rainfall in the years 1860-65 to have been respectively 87.99, 139.04, 111.19, 148.89, and 89.54 inches. The climate is, however, mild and healthy, and the average standard of longevity uncommonly high. Agriculture in Skye is comparatively unprofitable, owing to the moisture of the climate, and is, in fact, falling into entire neglect on some of the chief sheep-farms. The soil, however, is in many places excellent, and capable, in dry seasons, of yielding good cereal crops, while for turnips it is peculiarly suited.

The inhabitants are for the most part poor. In the districts where the men practice fishing, nearly the whole of the adult males go to the Caithness fisheries in summer, while from all parts of the island young men and women go in troops to the s. in search of field-labor. Potatoes and fish are the general diet, meat being a rare luxury. The population is chiefly Celtic, with, however, a considerable mixture of the Norse element. Gaelic is still universally spoken, but is gradually giving place to English. The chief proprietors are still, as of old, lord Macdonald, whose seat, Armadale castle in Sleat, is one of the most beautiful in all its surroundings to be seen on the Scottish coasts, and Macleod of Macleod, whose ancient castle of Dunvegan, picturesquely seated on a rock, has been pleasantly commemorated by Dr. Johnson and sir Walter Scott. Around these residences are the principal plantations to be seen in Skye. The principal port of Skye is Portree, a picturesquely situated village of (1871) 731 inhabitants, to which steamers regularly ply from Glasgow. Other villages, also calling-points of the steamers, are Kyleakin (Hakon's strait), Broadford, and Dunvegan. The principal exports are cattle and sheep, wool, fish, shell-fish, and eggs. At Portree there is a flourishing tweed manufactory, the only one in the island. The celebrated distillery of Carabost (or Talisker) is now given up. The inhabitants are, with the exception of a few families, all Presbyterians, and, as in the rest of the highlands, chiefly adherents of the free church. Of the smaller islands near Skye, the chief are Raasay (q.v.), Ronay, Scalpay, Pabbay, Soay, all of which are inhabited.

SKYROS, or **SERNO**, an island of the Grecian archipelago, the largest member of the northern Sporades, 25 m. n.e. of cape Koumi, Eubœa. Its length is 19 m.; area estimated at about 60 sq. miles. Skyros, is very mountainous and uncultivated in the s.; but the northern part, though also hilly, has several fertile plains, which produce as fine wheat as any grown in the archipelago. The only town in the island is Skyro, or St. George, which is built on a high peak on the eastern coast, the broad summit of which is occupied by the ruins of a castle, and was the site of "the lofty Seyros" of Homer. There are several relics of antiquity on the island. Pop. '70, 3,029.

SLAGS, called otherwise *scorie* or *cinders*, are fused compounds of silica in combination with lime, alumina, or other bases; and result as secondary products from the reduction of metallic ores. More or less of the metal always remains in a slag; in the early days of iron-smelting, the proportion of metal thus wasted was so great that some old slags have been profitably smelted in recent times. Slags being silicates, are of the nature of glass, and externally have a glassy, crystallized, or stone-like character. Beautifully crystallized specimens are occasionally to be met with at smelting-works. They vary very much in color, and are sometimes so prettily veined and marbled, that attempts have been made to apply them to ornamental purposes. Millions of tons of slag are annually produced at the iron-smelting works of Great Britain, but almost the only use to which it has yet been successfully applied is in the making of square blocks or bricks for building purposes. The slag is run into molds, either as it issues from the blast-furnace, or after being remelted; and it is found to be a very durable material. Broken slag is also used as a covering for roads, but its brittleness and sharpness are objectionable qualities for this purpose. Several patents, beginning so far back as 1728, have been taken out for casting slag into articles of a more ornamental kind, but hitherto they have not been commercially successful.

In an archaeological point of view, slags are interesting as pointing out the sites of ancient smelting-works, and as affording a clue to the primitive methods of obtaining the metals from their ores.

SLANDER is an injury to a person's character and reputation caused by spoken words. It is difficult to define what kind of injuries of this nature are actionable, but in general whatever imputes disgraceful, fraudulent, or dishonest conduct, or even tends to make a man contemptible in his private relations, and shunned by his friends and neighbors, is a slander. Thus, whatever imputes a crime, or indictable offense, or a contagious disease, is a slander. There are some epithets, however, which are not actionable unless some special damage is directly caused thereby, as calling a man a scoundrel, swindler, rogue, gambler, liar, etc. To call a woman a whore is also not actionable, unless she can show that she has lost offers of marriage, etc., thereby. Words imputing gross ignorance or misconduct affecting one's trade or profession are, however, actionable, as calling a man a bankrupt grocer, a quack doctor, etc. See also **LIBEL**. The remedy for slander is an action at law for damages. Though certain words when spoken will not amount to slander, yet, if printed or written, they will sometimes become so, as calling one a rogue, swindler, rascal, etc.

SLANDER (*ante*). Words actionable in themselves, without proof of special damage, must "impute," according to Heard, *Libel and Slander*, § 24, "the commission of a crime involving moral turpitude, and which is punishable by law." Words spoken of one in office and tending to cause the loss of that office, or words imputing want of ability or capacity in business, or words imputing to a man a disease or distemper which renders him unfit for society, are likewise actionable without proof of special damage. In the case of words not actionable in themselves, special damage must be specified in the declaration. To make words actionable they must be uttered without legal cause. But some communications are privileged. The slander must be com-

communicated to a third person. Malice is essential, but will be inferred in the absence of evidence to the contrary. The falsity of the charge will be inferred till the contrary is shown. A repetition of oral slander, already in circulation, without any expression of an opinion as to its truth, is actionable.

SLANG, a word originally borrowed from the gypsy tongue, where it is used for the secret language of that tribe. In its usual signification it denotes a burlesque style of conversational language, originally found only among the vulgar, but now more or less in use in this country among persons in a variety of walks in life. It is somewhat allied to, though not identical with, *cant* (in French *argot*), the language used for purposes of concealment by thieves and vagrants of all descriptions.

Slang is not exclusively of modern date. It was known in the classic ages of Greece and Rome, and abounds in the writings of Aristophanes, Plautus, Terence, and Martial. Every modern European language has its slang. In our country, the "rump," the "barebones parliament," the terms "Roundheads," "Puritans," "Quakers," all belonged to the slang of the 17th century. *Hudibras* and the dramatic works of last century abound in slang. Old English slang was coarser than that now in use, but the greater portion of its phraseology had a somewhat restricted circulation, not permeating every species of conversation to the extent that modern slang does. Toward the close of last century the slang vocabulary received large additions from pugilism, racing, and "fast life;" and its fashionable vulgarisms came into great favor during the minority of the prince regent. In the present century the growth of refinement in manners and ideas has not banished slang, but given it a more familiar and utilitarian character, while it has been introduced in some measure into circles where it was formerly unknown.

Slang consists in part of new words, and in part of words of the legitimate language invested with new meanings, such as are assigned to the verbs *cut*, *to do*. Many slang expressions are derived from thieves' cant, and some from the gypsy tongue. Their derivations are often indirect, arising out of fanciful allusions and metaphors, which soon pass out of the public mind, the word remaining, while its origin is forgotten. The origin of much of the current slang may be traced to the universities of Oxford and Cambridge, and the great public schools of England. There is not an institution connected with the university which has not its slang equivalent (e.g., "plucked," "little go").

There is a slang attached to various professions, occupations, and classes of society. The slang of English fashionable life and fashionable novels comprises a number of French words and phrases, whose application is often very different from what is current in France. *The beau monde*, a *chaperon*, a marriage being on the *tapis*, are expressions which, in their English sense, are utterly unknown in Paris. To the slang of military life Hindustani has contributed its quota of words, imported by officers who have resided long in India. We have also parliamentary slang, religious slang, literary slang, civic slang, and shopkeepers' slang.—Many curious details regarding slang in all its departments are to be found in Hotten's *Slang Dictionary* (Lond., 1865).

SLATE, OR CLAY-SLATE (Fr. *esclat*, a shiver or splinter), is a highly metamorphosed argillaceous rock, fine-grained and fissile, and of a dull blue, gray, green, or black color. It splits into thin laminae or plates, that are altogether independent of the layers of deposit; though sometimes coinciding with them, they more frequently cross them at different angles. See **CLEAVAGE**. Some rocks that split into the thin plates of the original stratification are popularly but erroneously named slate, as the thin bedded sandstones properly called flagstones or tilestones, the fissile shales of Cambrian and Silurian age, and the metaphoric, gneiss, and mica schist, whose planes of division correspond to their stratification. True slate is a very compact rock, little liable to be acted upon by atmospheric agencies. It is chiefly obtained from paleozoic strata, but it is found also among more recent rocks. It is used for various purposes, being split into thin slabs of small size for the roofing of houses, and into larger slabs for fitting up chimneys, etc., and even for making billiard-tables, and split and polished by means of pumice for writing-slates. There are extensive quarries of roofing-slate in Wales and in the western Highlands of Scotland, and in the Ardennes in France, some of which have been wrought for a long time, and give employment to a great number of workmen. A hard compact slate is best for roofing; that which is porous imbibes water, the freezing of which splits it in winter, while it affords also a soil for mosses, which soon injure the roof.

In roofing with slates it is necessary to put on the slates in two thicknesses, so that the sloping joints may be covered by the overlap of the course above. Besides this, the third course must also cover the first by an inch or two, to prevent rain from penetrating. Slates are generally laid upon boarding, and bedded in lime, and nailed with malleable-iron nails, jappeded, so as to prevent them from rusting. When large strong slates are used, they may be nailed to strong laths in place of boarding. Welsh slates are the cheapest and most generally used; but Easdale or Ballachulish slates, from the w. of Scotland, are stronger and better when the roofs are liable to be injured.

SLATE-PENCILS are either cut or turned sticks of slate, or they are made by pressing moistened slate-powder until it is firm enough to be made into pencils.

SLATER, SAMUEL, 1768-1835; b. England; apprenticed in 1782 to Strutt, Arkwright's partner in cotton spinning, and learned the business. Having heard of a United States law to promote manufactures, and of the bounty offered by the Pennsylvania legislature for the introduction of the Arkwright patents into this country, he came to New York in 1789. Going to Providence at the request of Moses Brown of that place, who had made some experiments in cotton-spinning machinery, he contracted to build and run the machinery required, and in 1790 started a mill at Pawtucket with 72 spindles and 3 carding-machines. The cotton manufacture of this country dates from that time. He afterward built cotton-mills of his own at what is now Webster, Mass., and erected woolen mills at the same place, 1815-16. He thus built up the village of Slatersville, where his descendants still carry on a prosperous business. He was a liberal employer, and established schools for the children of his workmen. He had to rely solely upon his memory to reproduce the Arkwright machinery, the English laws forbidding the exportation of models. For some time he could not recall an important mechanical detail, which finally occurred to him in a dream.

SLAVE-COAST, a division of the coast of Upper Guinea, Africa, lying between the rivers Volta and Lagos. See GUINEA.

SLAVERY. A slave is an individual who is the property, or at the disposal of another, who has a right to employ or treat him as he pleases. Such is the state of the slave in the most absolute sense of the term; but slavery has been subjected to innumerable limitations and modifications.

Slavery probably arose at an early period of the world's history out of the accident of capture in war. Savages, in place of massacring their captives, found it more profitable to keep them in servitude. All the ancient oriental nations of whom we have any records, including the Jews, had their slaves. The Hebrews were authorized by their law to possess slaves, not only of other races, but of their own nation. The latter were generally insolvent debtors, who had sold themselves through poverty, or thieves who lacked the means of making restitution; and the law dealt with them far more leniently than with stranger slaves. They might be redeemed; and if not redeemed, became free in the space of seven years from the beginning of their servitude; besides which, there was, every fiftieth year, a general emancipation of native slaves.

Slavery existed in ancient Greece: in the Homeric poems, it is the ordinary destiny of prisoners of war; and the practice of kidnapping slaves is also recognized—Ulysses himself narrowly escaping a fate of this kind. None of the Greek philosophers considered the condition of slavery objectionable on the score of morals. Aristotle defends its justice on the ground of a diversity of race, dividing mankind into the free and the slaves by nature; while Plato only desires that no Greeks should be made slaves. One class of the Greek slaves were the descendants of an earlier and conquered race of inhabitants, who cultivated the land which their masters had appropriated, paid rent for it, and attended their masters in war. Such were the Helots in Sparta, the Penestæ in Thessaly, the Bithynians at Byzantium, etc., who were more favorably dealt with than other slaves, their condition somewhat resembling that of the serfs of the middle ages. They could not be sold out of the country, or separated from their families, and were even capable of acquiring property. Domestic slaves obtained by purchase were the unrestricted property of their owners, who could dispose of them at pleasure. In Athens, Corinth, and the other commercial states, they were very numerous, and mostly barbarians. They were employed partly in domestic service, but more as bakers, cooks, tailors, or in other trades, and in mines and manufactories; and their labor was the means by which the owner obtained profit for his outlay in their purchase. These slaves were, for the most part, purchased; but few were born in their master's family, partly from the general discouragement of the cohabitation of slaves, and partly from the small number of the female in comparison with the male slaves. An extensive traffic in slaves was carried on by the Greek colonists in Asia Minor with the interior of Asia; and another source of supply arose from the practice common among Thracian parents of selling their children. In Greece in general, and especially at Athens, slaves were mildly treated, and enjoyed a large share of legal protection. According to Demosthenes, a slave at Athens was better off than a free citizen in many other countries.

The Roman condition of slavery differed in some particulars from that of Greece. All men were considered by the Roman jurists to be free by natural law; while slavery was regarded as a state contrary to natural law, but agreeable to the law of nations, when a captive was preserved, instead of being slain (hence the name *servus*, quasi, *servatus*); or agreeable to the civil law, when a free man sold himself. In earlier times, there was no restriction on the master's power of punishing or putting to death his slave; and even at a later period, when the law on this head was much modified, slaves were used with considerable rigor. The estimation in which their lives were held is illustrated by the practice of gladiatorial combats, as also by the conduct of Vedius Pollio, who, in the polite age of Augustus, flung such slaves as displeased him into his fish-ponds, to feed his lampreys, and on the matter being brought under the emperor's notice, was visited with no severer punishment than the destruction of his ponds. Old and useless slaves were often exposed to starve in an island of the Tiber. Under the empire, the cruelty of masters was in some degree restrained by law. It was enacted, that a man who put

to death his own slave without cause should be dealt with as if the slave had been the property of another; and that if the cruelty of the master was intolerable, he might be compelled to sell the slave. A constitution of Claudius declared the killing of a slave to be murder, and it was also enacted, that in sales of slaves, parents and children, brothers and sisters, should not be separated. A slave could not contract marriage, and no legal relation between him and his children was recognized. The children of a female slave followed the status of their mother. There was various ways in which a slave might be manumitted, but the power of manumission was restricted by law. The harboring of a runaway slave was illegal. The number of slaves in Rome, originally small, was increased much by war and commerce; and the cultivation of the soil came, in the course of time, to be entirely given up to them. During the later republic and empire, persons in good circumstances kept an immense number of slaves as personal attendants; and the possession of a numerous retinue of domestic slaves was matter of ostentation—200 being no uncommon number for one person. A multitude of slaves were also occupied in the mechanical arts and the games of the amphitheater. Originally, a slave was incapable of acquiring property, all his acquisitions belonging to his master; but when slaves came to be employed in trade, this condition was mitigated, and it became the practice to allow a slave to consider part of his gains, called his *peculium*, as his own, a stipulation being sometimes made that he should purchase his freedom with his *peculium*, when it amounted to a specific sum.

Though the introduction of Christianity did not do away with slavery, it tended to ameliorate the condition of the slave. Justinian did much to promote the eventual extinction of slavery; and the church excommunicated slave-owners who put their slaves to death without warrant from the judge. But the number of slaves again increased; multitudes being brought with them by the barbarian invaders, who were mostly Slavonian captives (whence our word *slave*); and in the countries which had been provinces of the empire, slavery continued long after the empire had fallen to pieces, and eventually merged into the mitigated condition known as serfdom, which prevailed all over Europe in the middle ages, and has been gradually abolished in modern times. See SERF. But though the practice of selling captives taken in war as slaves ceased in the Christian countries of Europe, a large traffic in slaves continued among Mohammedan nations, by whom Christian captives were sold in Asia and Africa; and in the early middle ages the Venetian merchants traded largely in slaves, whom they purchased on the coast of Slavonia, to supply the slave-markets of the Saracens.

The negro slavery of modern times was a sequel to the discovery of America. Prior, however, to that event, the negroes, like other savage races, enslaved those captives in war whom they did not put to death, and a considerable trade in slaves from the coast of Guinea was carried on by the Arabs. The deportation of the Africans to the plantations and mines of the New World doubtless raised the value of the captive negro, and made slavery rather than death his common fate; while it may also have tempted the petty princes to make war on each other, for the purpose of acquiring captives, and selling them. The aborigines of America having proved too weak for the work required of them, the Portuguese, who possessed a large part of the African coast, began the importation of negroes, in which they were followed by the other colonizers of the New World. The first part of the New World in which negroes were extensively used was Hayti, in St. Domingo. The aboriginal population had at first been employed in the mines; but this sort of labor was found so fatal to their constitutions that Las Casas, bishop of Chiapa, the celebrated protector of the Indians, interceded with Charles for the substitution of African slaves as a stronger race; the emperor accordingly, in 1517, authorized a large importation of negroes from the establishments of the Portuguese on the coast of Guinea. Sir John Hawkins was the first Englishman who engaged in the traffic, in which his countrymen soon largely participated, England having exported no fewer than 300,000 slaves from Africa between the years 1680 and 1700, and between 1700 and 1786, imported 610,000 into Jamaica alone. The slave-trade was attended with extreme inhumanity; the ships which transported the negroes from Africa to America were overcrowded to such an extent that a large proportion died in the passage; and the treatment of the slave after his arrival in the New World depended much on the character of his master. Legal restraints were, however, imposed in the various European settlements, to protect the slaves from injury; in the British colonies, courts were instituted to hear their complaints; their condition was to a certain extent ameliorated, and the flogging of women was prohibited. But while slavery was thus legalized in the British colonies, it was at the same time the law of England (as decided in 1772 in the case of the negro Somerset), that as soon as a slave set his foot on English soil he became free; though, if he returned to his master's country, he could be reclaimed.

Before the idea of emancipation was contemplated, the efforts of the more humane portion of the public were directed toward the abolition of the traffic in slaves. In 1787 a society for the suppression of the slave-trade was formed in London, numbering Messrs. W. Dillwyn, Thomas Clarkson, and Granville Sharp among its original members. The most active parliamentary leader in the cause was Mr. William Wilberforce, whose views were seconded by Mr. Pitt. In February, 1788, an order of the crown directed that an inquiry should be made by a committee of the privy-council into the state of the slave-trade; and an act was passed to regulate the burden of slave-ships, and otherwise dimin-

ish the horrors of the middle-passage. A bill introduced by Mr. Wilberforce for putting an end to the further importation of slaves was lost in 1791. Meanwhile, our conquest of the Dutch colonies having led to a great increase in the British slave-trade, an order in council in 1805 prohibited that traffic in the conquered colonies; and in the following year, an act was passed forbidding British subjects to take part in it, either for the supply of the conquered colonies or of foreign possessions. In the same year, a resolution moved by Mr. Fox for a total abolition next session, was carried in the commons, and on lord Granville's motion, adopted in the lords; and the following year, the general abolition bill, making all slave-trade illegal after Jan. 1, 1808, was introduced by lord Howick (afterward earl Grey) in the house of commons, and was carried in both houses, and received the royal assent on Mar. 25, 1807. British subjects, however, continued to carry on the trade under cover of the Spanish and Portuguese flags; the slave-ships were more crowded than ever, from the necessity of avoiding capture, and the negroes were not unfrequently thrown overboard on a pursuit. The pecuniary penalties of the act were discovered to be inadequate to put down a traffic so lucrative as to cover all losses by capture. Mr. Brougham therefore, in 1811, introduced a bill, which was carried unanimously, making the slave-trade felony, punishable with 14 years' transportation, or from three to five years' imprisonment with hard labor. An act of 1824 declared it piracy, and as such, a capital crime, if committed within the admiralty jurisdiction; and the statute of 1837, mitigating the criminal code, left it punishable with transportation for life. Among the philanthropic projects due to the exertions of the anti-slavery society was the establishment of the colony of Sierra Leone, on the coast of Africa, which had been formed by the British government in 1787, in order to show the possibility of obtaining colonial produce without slave-labor, and after the abolition of the slave-trade, became a settlement for the negroes captured by British cruisers.

The United States of America abolished the slave-trade immediately after Great Britain, and the same was in the course of time done by the South American republics of Venezuela, Chili, and Buenos Ayres, by Sweden, Denmark, Holland, and during the hundred days after Napoleon's return from Elba, by France. Great Britain, at the peace, exerted her influence to induce other foreign powers to adopt a similar policy; and eventually nearly all the states of Europe have passed laws or entered into treaties prohibiting the traffic. The accession of Portugal and Spain to the principle of abolition was obtained by treaties of date 1815 and 1817, and by a convention concluded with Brazil in 1826, it was declared piratical for the subjects of that country to be engaged in the slave-trade after 1830. By the conventions with France of 1831 and 1833, to which nearly all the maritime powers of Europe have since acceded, a mutual right of search was stipulated within certain seas, for the purpose of suppressing this traffic. The provisions of these treaties were further extended in 1841 by the quintuple treaty between the five great European powers, subsequently ratified by all of them except France. The Ashburton treaty of 1842 with the United States provided for the maintenance by each country of a squadron on the African coast; and in 1845, a joint co-operation of the naval forces of England and France was substituted for the mutual right of search.

The limitation of the supply of negroes naturally led, among other good results, to a greater attention on the part of the masters to the condition of their slaves. But the attention of British philanthropists was next directed toward doing away with slavery altogether in our colonies. Societies were formed with this end, an agitation was set on foot, and attempts were made, for some time without success, to press the subject of emancipation on the house of commons. At length, in 1833, a ministerial proposition for emancipation was introduced by Mr. Stanley, then colonial secretary, and an emancipation bill passed both houses, and obtained the royal assent, Aug. 28, 1833. This act, while it gave freedom to the slaves throughout all the British colonies, at the same time awarded an indemnification to the slave-owners of £20,000,000. Slavery was to cease on Aug. 1, 1834; but the slaves were for a certain duration of time to be apprenticed laborers to their former owners. Objections being raised to the apprenticeship, its duration was shortened, and the complete enfranchisement took place in 1838.

The French emancipated their negroes in 1848; as did most of the new republics of South America at the time of the revolution; while the Dutch slaves had freedom conferred on them in 1863. In Hayti slavery ceased as far back as 1791, its abolition having been one of the results of the negro insurrection of that year. Slavery still exists in the Spanish and Portuguese colonies, but recent acts have been passed for its abolition. In Brazil a law for the gradual emancipation of slaves was passed in 1871. It enacts that from that date children born of slave women shall be free; while, at the same time, they are bound to serve the owners of their mothers as apprentices for twenty-one years. A recent treaty between Great Britain and the sultan of Zanzibar secures, in promise, the speedy abolition of the slave-trade on the opposite eastern coast of Africa. The expedition of sir Samuel Baker in 1873 was announced as having put an end to the slave-trade to the s. of Egypt, as far as the equator. How far the khedive was sincere in coupling this object with the conquest of the Nile regions is doubtful; and it is certain that most of his officers, and an army of slave-hunters, are bent on defeating the attempt. In 1874 the British governor at the gold coast, where domestic slavery still existed, announced that thenceforth no person could be sold as a slave in the protectorate, or removed from it for that purpose.

In presence of the statement in the "Declaration of Independence," that "all men are born free and equal, and possess equal and inalienable rights to life, liberty, and the pursuit of happiness," the colonies which threw off the British yoke numbered several hundred thousand negro slaves, whose condition of slavery was expressly recognized in the constitution of the United States, as ratified in 1788, provision being there made for the rendition of fugitive slaves, a subject the regulation of which was delegated to the federal government, slavery being otherwise left to be governed by the laws of the states where it existed. Slavery established itself firmly in the southern states, where negro labor was required for the cultivation of sugar and cotton; and after the limitation of the supply from Africa, the breeding of slaves went on to a large extent in Maryland and Virginia for the supply of the other states of the south. The different positions of the northern and southern states regarding slavery, combined with other causes to engender that diversity of feeling and interest between north and south out of which arose the civil war. The politicians of the north, however, except a small section, by no means advocated the abolition of slavery where it already existed; they only objected to its extension to new territories. The increased consumption of cotton led to an increased demand for slave-labor; and in 1820, when Missouri was admitted to the union as a slave state, a compromise was entered into by which slavery was legalized to the south, but prohibited to the north of 36° 30' n. lat. (see MASON AND DIXON'S LINE). California, though partly lying s. of that geographical line, was admitted as a free state, the southern party obtaining in compensation the boon of an amendment of the fugitive slave law, making it penal to harbor runaway slaves or aid in their escape. A reaction against the policy of the south, and Mr. Lincoln's election as president, were the signals for a long-contemplated secession of the southern states, and the bloody war which ended in the overthrow of the principle of state-sovereignty and the consolidation of the union. In the course of the war many negroes were emancipated; and on Sept. 22, 1862, Mr. Lincoln issued a proclamation declaring all the negroes of secession masters who should not have returned to the union before Jan. 1, 1863, to be free. Since then the legislatures of the different states have formally accepted the amendment of the constitution, and passed an act for the abolition of slavery.

SLAVERY (*ante*). In 1776 there had been about 300,000 Africans imported into the British colonies in America, from the time of their first settlement. The number existing in the United States, according to the first census, 1790, was 697,897; every state in the union contributing except Massachusetts, which at this time included Maine. Ten years later the number had increased to 893,041; and in 1810 to 1,191,264. The succeeding decennial census showed the following figures as the existing number of slaves in the states at the dates mentioned:

1820.....	1,538,022
1830.....	2,009,042
1840.....	2,487,455
1850.....	3,204,313
1860.....	3,953,760

At the period of the organization of the national government the feeling of distaste for the institution of domestic slavery was strong in the southern states themselves, and prevalent throughout the union, though certain ship-owners of Boston and other parts of New England found it to their interest to foster a state of things which was to them greatly remunerative. They supplied the slave ships which transported the Africans from the points of departure on the w. coast of Africa, and grew rich on the traffic. But Vermont abolished slavery in 1777; Massachusetts in 1780; and Rhode Island and Connecticut gradually, both these states having a few slaves as late as 1840. New York finally abolished the institution in 1827; having gradually emancipated its slaves since 1799. New Jersey followed the same plan in 1804, and had 236 slaves still living in 1850. Pennsylvania commenced gradual emancipation in 1780, and in 1840 contained 64 slaves. The southern states had from the beginning found slaves more profitable to them than they could have ever possibly been in the north; and this fact alone had been sufficient to occasion the gradual centralization of the institution within the boundaries of those states. But the invention of the cotton-gin in 1793, by Eli Whitney, a Massachusetts man, increased the demand for labor, and specially increased the available uses of slave labor. In 1791 the entire cotton crop of the United States amounted to 2,000,000 pounds. In 1801 the crop was 48,000,000, of which nearly one-half was exported. In 1821 the crop was 180,000,000 pounds; in 1825, 255,000,000; and it continued to increase until, in 1860, it was 2,054,698,800 pounds. In the face of this tremendous accretion of a product representing a vast increase in the wealth of the country and of individuals, the feeble efforts of persons to oppose the continuance of what was esteemed the chief producing force, were of course futile. Washington, Jefferson, Franklin, Hamilton, and others of the leaders of public opinion in the early history of the country, were opposed to slavery on moral and religious grounds; and not less as a system calculated to become a retarding influence as to the progress of civilization and the general advancement of the people. And had not the invention of the cotton gin operated to encourage the perpetuation of the system, the opinions of such men would

have doubtless exercised their due weight in creating a profound and general public sentiment in antagonism to its existence. As it was, the question grew to be considered from this standpoint by humanitarians alone; while, having gradually become absorbed into the general party politics of the country, and connected with important points arising in relation to the accession of new territory, and its political status, its bearing eventually became national, and in a sense vital. The opponents of slavery began as early as 1775, with the formation of the Pennsylvania abolition society, their consistent resistance to the continuance and spread of slavery. By them, and from the period of the establishment of the *Liberator* in Boston, in 1831, under the leadership of William Lloyd Garrison, Wendell Phillips, Arthur Tappan, and other prominent men, a crusade against slavery was undertaken, which never ceased until victory had been achieved, and the last slave was freed. The formation of a political (free-soil) party in 1848 organized the various elements throughout the country which were in agreement on the main question; and candidates for the presidency on the broad platform of freedom for the slave assumed a position in national politics. Compromises began to be the only method for settling, even temporarily, questions whose complete recognition and conclusion seemed dangerous and impracticable in the existing and growing state of excited public feeling. The effort to extend slavery into the newly acquired territories was the rock on which the pro-slavery leaders eventually split; and the outbreak in Kansas, and the Fremont presidential campaign foreshadowed the serious character of the coming struggle. The "underground railroad," as it was called, the secret and persistent method of northern abolitionists to settle the question practically by absorbing the slaves into non-slaveholding communities, roused a bitterness of feeling in the south, which not even supreme court decisions and congressional enactments in favor of the slaveholders could allay. Missouri border ruffianism and "squatter sovereignty" were answered by Sharp's rifles, and at length the raid of John Brown at Harper's Ferry presented the "impending crisis," which the election of Lincoln made positive and present. The old antagonism between Puritan and cavalier; between manufacturing and agricultural interest; between a northern and a southern people, was now laid upon the shoulders of the institution of slavery. And the revolution which had become essential to clear the moral and political atmosphere of the country of all these varieties of antagonism, presented itself in the form of the rebellion of 1861-65; and concluded, so far as the existence of slavery was concerned, with the edict of president Lincoln of Jan. 1, 1863: see EMANCIPATION, PROCLAMATION OF. This proclamation had been suggested, and the minds of the people prepared for it, by the act of congress of March 13, 1862, which forbade the employment of military force to return fugitives to slavery; and that of July 16, 1862, authorizing the confiscation of the property of rebels, including slaves under this designation. The proclamation had but little immediate practical effect except within the lines of the federal army; but it gave system and regularity to the treatment of the whole question; which had previously, in the hands of federal commanders, been sufficiently undefined and chaotic. See also ABOLITION, ANTI-SLAVERY, KANSAS, MISSOURI COMPROMISE.

SLAVES, or SLAVONIANS (native name *Slowene* or *Slowane*, derived by some from *slawa*, fame, but better from *slowo*, a word; thus meaning "speaking," or "articulate," as distinguished from other nations, whom they called niemetz, or "mutes"), the general name of a group of nations belonging to the Aryan family whose settlements extend from the Elbe to Kamtchatka, and from the Frozen sea to Ragusa on the Adriatic, the whole of eastern Europe being almost exclusively occupied by them. They were settled in these regions before the dawn of history, and are comprehended by ancient writers under the designations of Sarmatians and Scythians. The original names of the Slavic tribes seem to have been Winds or Wends (*Venedi*) and Serbs. The former of these names occurs among the Roman writers, and later, in Jornandes, in connection with the commercial peoples of the Baltic sea; the latter is spoken of by Procopius as the ancient name common to the whole Slavic stock. The earliest historical notices extant represent the Slaves as having their chief settlements about the Carpathians, from which they spread northward to the Baltic, westward as far as the Elbe and the Saal, and later, after the overthrow of the kingdom of the Huns southward beyond the Danube, and over the whole peninsula between the Adriatic and the Black sea. These migrations ceased in the 7th c.; the division of the Slavic stock into separate branches became now more complete, and gradually they began to form into independent states. The various sections of the stock may be divided into two groups—the south-eastern and the western; the first comprehends (1), Russians; (2), Bulgarians; (3), Illyrians (Serbs, Croats, Winds); the second (1), Lechs (Poles, Silesians, Pomeranians); (2), Czechs or Bohemians (Czechs, Moravians, Slovaks); (3), Polabians, comprising the Slavic tribes of n. Germany, who are fast disappearing, by being absorbed in the Teutonic population. With the exception of Russia and, since the Berlin congress of 1878, of Serbia and Montenegro, the once numerous Slavic kingdoms (Bohemia, Bulgaria, Moravia, Poland, etc.), have lost their independent sovereignty and been incorporated in other states—chiefly Turkey, Austria, Prussia, and Saxony. The Polabians never attained any distinct political footing. The whole of the Slavic populations are estimated at upward of 80,000,000.

The Slaves are represented by ancient writers as an industrious race, living by agri-

culture, and the rearing of flocks and herds; as hospitable and peaceful, and making war only in defense. The feeling of nationality was strong among them. The government had a patriarchal basis, and chiefs or princes were chosen by assemblies. But contact with the feudal institutions of the Roman-German empire gradually altered this primitive constitution. The Slavic princes strove after unlimited power like that of the emperors; and the chiefs sought to dominate over the people like the feudal nobility. In the course of the 11th, 12th, and 13th c. nobility became a hereditary privilege throughout the Slavic states. The worst kind of feudalism fairly took root, and the people sank into the condition of serfs. Between them and the nobles there was no third or middle class, as the peculiar privileges of the nobility prevented the growth of cities. See SERF, RUSSIA.

The religion of the ancient Slaves, like that of the Teutonic nations, seems to have been, in many of its features at least, a kind of nature-worship; not, however, without the idea of a One supreme power, to whom the other agencies were subordinate. From this some authorities infer that the system was originally a monotheism which in process of time had become obscured and confused by the infusion of foreign elements, and thus degenerated into polytheism, and finally pantheism. The chief deity, whose worship seems to have been common to all the Slavic tribes, was Swiatowit, with whom were associated on a nearer footing of equality than the other gods, Perun and Radegast—if, indeed, these three names do not merely denote different personations or manifestations of the same power. In this trinity Swiatowit is considered as most analogous to Mars and Zeus, Perun to Jupiter and Thor, and Radegast to Mercury and Odin. Of the numerous gods of an inferior order we may name Prowe, god of justice; Prija (= Freya), Venus; Bjelbog, the white god, and Cernobog, the black god; together with multitudes of demons and spirits, good and bad. The images of the Slavic divinities (a stone statue of Swiatowit was in recent times discovered in eastern Galicia) had a striking resemblance to those of India. Swiatowit had four heads, Rugewit (the god of war) had seven faces, and Perun four, and so on. The Slaves seem to have been not without some crude notion of existence and retribution after death. Worship was performed in groves and temples, cattle and fruits being offered by the priests, whose office must have been originally performed by the head of the family or chieftain, as the common name for priest and prince (*kniaz*) shows.—The eastern Slaves received Christianity from Byzantium in the 9th c. through the instrumentality of Cyril (q.v.) and Methodius; the western, from Rome and Germany.—See Schafarik, *Slaw. Alterthümer* (Ger. translation, Leip. 1843).

SLAVIC LANGUAGE AND LITERATURE. The term Slavic, as applied to language or race, is a generic name (like Celtic or Teutonic) for a group of kindred languages and peoples belonging to the great Indo-Germanic or Aryan family. In its roots and structure the Slavic language exhibits a remarkable similarity to Sanskrit, but has become European, so to speak, in the course of a long literary development, begun before that of any of the other European families. Its peculiarities are quite marked. The leading characteristics of the Slavic tongues are the completeness of their system of declensions, the want of articles, the absence of pronouns in the conjugation of the verb, pure vowel-endings, the fixed quantity of the syllables, the free construction of sentences, and the richness of their vocabulary. The earliest dialect of Slavic that received a literary culture was the "old Bulgarian," better known as the "church Slavic," which, however, failed to become the literary vehicle for all the Slavic peoples, inasmuch as the special dialect of each gradually acquired a literature of its own. Altogether, writers reckon eight distinct extant dialects of Slavic—1. The "new Bulgarian;" 2. The Russian; 3. The Servian or Illyrian; 4. The Polish; 5. The Bohemian; 6. The Slovak; 7. The Wendic; 8. The Polabie. Such of these as merit special treatment have received it.—See **BOHEMIAN LANGUAGE AND LITERATURE**, **POLISH LANGUAGE AND LITERATURE**, **RUSSIAN LANGUAGE AND LITERATURE**, **SERVIAN LANGUAGE AND LITERATURE**.—In regard to Slavic literature, considering the articles just mentioned, it is only necessary to state that at present the Russian branch of the Slavic is the richest in the number of its published works; but, as regards literary merit, the Polish ranks first, having cultivated with great success almost all sorts of literature, and possessing in particular a very exquisite poetry. The Bohemian and Servian literatures both contain many fine and distinctively original productions, worthy of being more widely known than they are.—See Schafarik's *History of the Slavic Language and Literature* (1816); and Miklosich's *Vergl. Grammatik der Slaw. Sprachen* (Vienna, 1852-71).

SLAVONIA, a province of Austria, lying e. of Croatia (q.v.), with which it is now politically united. It is bounded on the n. by the Drave, on the e. by the Danube, on the s. by the long strip of marsh-land known as the Slavonian military frontier, which stretches between it and the Save. Area of the kingdom of Croatia (q.v.) and Slavonia, 8,840 sq.m.; pop. '69, 1,168,024. The greater part of the surface of Slavonia consists partly of eminences clothed with vines and fruit-trees, and partly of fertile and swampy plains. The mountains are rich in coal, marble, and mineral springs. The principal products are all sorts of grain, particularly maize and wheat, leguminous plants, and fruit in abundance, apples, pears, plums, walnuts, chestnuts, melons, wine, etc. There is little manufacturing industry in Slavonia.—The inhabitants of Slavonia belong

to the Slavic family (see SLAVES), and call their land Slavonska; themselves Slavonaz. They speak the so-called Illyrian or Serviad tongue. See SERBIAN LANGUAGE AND LITERATURE. The Slavonians proper are a handsome, tall, and slender race. The prevailing form of religion is the Roman Catholic, but the non-united Greek church also numbers many adherents. Education is still in a backward state. Capital of the country, Eszék (q.v.).

SLEAFORD, a t. of Lincolnshire, England, on the right bank of the Slea, a branch of the Witham, 17 m. s.s.e. from Lincoln, and 52 ft. above the level of the sea. It is a well-built and well-paved town, and has a fine church, built in the 13th century. Pop. '71, 3,592.

SLEEP. This term is employed to designate that state of suspension of the sensory and motor functions which appear to alternate in all animals with the active condition of those functions, and which may be made to give place to it by the agency of appropriate impressions upon the sensory nerves. This definition, which we have borrowed from Dr. Carpenter's article on "Sleep" in Todd's *Cyclopædia of Anatomy and Physiology*, may seem somewhat complex, but cannot be simplified without rendering it less stringent. The necessity for sleep arises from the fact that the exercise of the animal functions is in itself destructive of the tissues of the organs which minister to them, so that if the waste produced by their action were not duly repaired, they would speedily become unfit for further use; and it is on the nutritive regeneration of the tissues which takes place during true healthy sleep that its refreshing power depends. While the sensory and motor functions are suspended during the condition we designate as sleep, the organic functions are uninterruptedly carried on, the respiratory, cardiac, and peristaltic movements proceeding with equal uniformity during the sleeping and waking states.

There can be no doubt that the state of sleep is one to which there is a periodical tendency, and that this disposition is so arranged as to correspond in its recurrence with the diurnal revolution of the earth. Although in man and most animals night is, from its darkness and silence, the natural period for repose, yet there are numerous exceptions to the rule. For example, amongst lepidopterous insects, butterflies are active during the day, hawk-moths during the twilight, and moths during the night. Amongst birds, the goat-sucker, or night-jar, and the owls, are nocturnal, and, as a general rule, the same is the case with carnivorous animals. The causes of sleep may be divided into the direct and the predisposing. The direct cause of sleep is that feeling of exhaustion or fatigue which is usually experienced when the waking activity has continued during a considerable portion of the twenty-four hours—a feeling that the brain requires repose; and, in fact, unless the brain be in an abnormal condition, sleep will at last supervene, from the absolute inability of that organ to sustain any further demands upon its energy. Among the predisposing causes which favor the access of sleep, we must especially notice "the absence of sensorial impressions; thus darkness and silence usually promote repose; and the cessation of the sense of muscular effort which usually takes place when we assume a position that is sustained without it, is no less conducive to slumber."—Carpenter's *Human Physiology*, 6th ed. 1864, p. 592. On the other hand, persons accustomed to live where there is a continuous noise, as in the neighborhood of mills or forges, often cannot sleep if the noise is suspended. These cases, however, probably fall within the next general predisposing cause—namely, the *monotonous repetition* of sensorial impressions. Thus the droning voice of an unimpressive reader or preacher, the gentle ripple of the ocean, the hum of bees, the rustling of foliage, and similar monotonous impressions on the auditory nerves, are usually provocative of sleep. In these and similar cases the influence of the impressions is exerted in withdrawing the mind from the consciousness of its own operations, and in suspending the directing power of the will; and this is the case, says Dr. Carpenter, "even when the attention is, in the first instance, *voluntarily* directed to them, as in some of the plans which have been recommended for the induction of sleep, when there exists no spontaneous disposition to it. In other methods the attention is fixed upon some internal train of thought, which, when once set going, may be carried on automatically, such as counting numbers, or repeating a Greek verb. In either case, when the sensorial consciousness has been once steadily fixed, the monotony of the impression (whether received from the organ of sense or from the cerebrum) tends to retain it there; so that the will abandons, as it were, all control over the operations of the mind, and allows it to yield itself up to the soporific influence. This last method is peculiarly effectual when the restlessness is dependent upon some mental agitation, provided that the will has power to withdraw the thoughts from the exciting subject, and to reduce them to the tranquilizing state of a mere mechanical repetition."

The access of sleep is sometimes quite sudden, the individual passing at once from a state of complete mental activity to one of entire torpor. More generally, however, it is gradual, the mind while remaining poised, as it were, between sleep and the opposite condition being "pervaded by a strange confusion which almost amounts to wild delirium; the ideas dissolve their connection with it one by one; and its own essence becomes so vague and diluted that it melts away in the nothingness of slumber."—Macnish, *Philosophy of Sleep*, p. 21. The amount of sleep required by man is affected by so

many conditions (among which must be especially mentioned *age, temperament, habits,* and previous exhaustion), that no general rule can be laid down on the subject. The condition of the *fetus* may be regarded as one of continuous slumber: on its first entrance into the world, the infant passes most of its time in sleep, and this is particularly the case in children prematurely born, such children seeming only to awake for the purpose of receiving food. During the whole period of growth, in which it is necessary that the *constructive* operations of the body should preponderate over the *destructive* processes, an excess of sleep is required; and by the time that adult age has been attained, and the constructive and destructive processes balance each other, the necessary amount of sleep has gradually fallen to about one-third or less of the diurnal cycle. In very old age, again, in consequence of the deficient energy of the nutritive process, a larger amount of sleep is required. With regard to the influence of temperature, it is observed that a plethoric habit of body usually predisposes to sleep, while thin wiry people of a nervous temperament require comparatively little sleep. Persons of lymphatic temperament are usually great sleepers, but this is probably due, as Dr. Carpenter suggests, to the fact, that "through the dullness of their perceptions they are less easily kept awake by sensorial or mental excitement" than persons of a happier temperament. The influence of habit is by no means inconsiderable on the amount of sleep required by individuals, and this influence may be brought to act on the protraction as well as the abbreviation of the usual period: as extreme examples, we may mention that gen. Elliott, celebrated for his defense of Gibraltar, did not sleep more than four hours out of the twenty-four (which is probably the smallest allowance for rest compatible with a life of vigorous exertion); while Dr. Reid the metaphysician, could take as much food, and afterward as much sleep, as were sufficient for two days. Moreover, the influence of habit in producing an aptitude for repose, or a readiness to wake at particular periods, is well known. The sleep of soldiers during a siege, of sailors or others who must take their rest as they best can, will often come on at command; nothing more being necessary to induce it than to assume a recumbent, or, at all events, an easy position, and to close the eyes. Thus, capt. Barclay, in his celebrated match, in which he walked 1000 m. in 1000 successive hours, very soon got into the habit of falling asleep the moment he lay down.

The condition of the great nervous centers during sleep is a subject of much interest, on which considerable light has recently been thrown by the observations of Mr. Durham.* These observations were made on a dog from which a portion of bone about as large as a shilling was removed from the parietal region of the skull, and the subjacent dura mater cut away so as to expose the brain; and Mr. Durham draws the following conclusions from them: 1. Pressure of distended veins upon the brain is not, as is generally believed, the cause of sleep, for during sleep the veins are *not* distended. 2. During sleep, the brain is in a comparatively bloodless condition; and the blood in the encephalic vessels is not only diminished in quantity, but moves with diminished rapidity; and this is corroborated by the observations of Dr. J. Hughlings Jackson on the ophthalmoscopic condition of the retina during sleep, the optic disk being then whiter, the arteries smaller, and the retina generally more anemic than in the waking state. 3. The condition of the cerebral circulation during sleep is, from physical causes, that which is most favorable to the nutrition of the brain-tissue.

This article would be imperfect without a brief reference to the conditions in which there is either an excess or a deficiency of sleep. There are numerous instances on record in which sleep has been continuously prolonged for weeks, or even months. Dr. Carpenter refers to two such cases, namely, those of Samuel Chilton (*Phil. Trans.* 1694) and Mary Lyall (*Trans. Roy. Soc. Edin.* 1818). Blanchet, a French physician, has recently recorded three cases of what he terms "constitutional lethargic slumber" in the *Comptes Rendus*, 1864. In one of these cases, the patient, a lady aged 24 years, who had slept for 40 days when she was 18 years of age, and 50 days when she was 20, at length had a sleep of nearly a year, viz., from Easter Sunday, 1862, to March, 1863. During this period, a false front tooth was removed in order to feed her with milk and soup, her only food. She was motionless and insensible. The pulse was low, the breathing scarcely perceptible, there were no evacuations, and she showed no signs of leanness, her complexion remaining florid and healthy. In such cases as these, it is not a prolongation of healthy natural sleep that is present, but a condition of hysteric coma.

Again, there are certain states of the nervous system in which there is either an entire absence of sleep (and this may continue for many days, or even weeks) or incomplete sleeplessness. Complete sleeplessness is often a most important symptom of disease. It frequently accompanies certain forms of continued fever, inflammatory affections of the brain, the eruptive fevers, etc., and when it continues for many days and nights, delirium, followed by stupor, is very apt to supervene. When the wakefulness is unattended by any disorder sufficient to account for it, some serious disease of the brain is most probably impending, such as palsy, apoplexy, or insanity. Incomplete or partial sleeplessness is a symptom of far less grave import. It is of frequent occurrence in persons whose minds are much engaged, or whose occupations subject them to great mental exertion or to the vicissitudes of fortune. It is, moreover, a symptom of many

* *The Physiology of Sleep*, in Guy's Hosp. Reports, Third Series, vol. vi. pp. 149-171.

chronic diseases, as gout, chronic rheumatism, skin-diseases, disorders of the urinary organs, dyspepsia, hysteria, etc. It may also be excited by certain beverages and articles of diet; thus green tea and strong coffee often occasion wakefulness, and a full meal of animal food late in the day often disturbs the sleep of persons accustomed to dine at an earlier hour.

In the treatment of sleeplessness, or *insomnia*, as it is usually termed by medical writers, the first indication is to remove the cause, which occasions it, and "more particularly to correct a close or contaminated air; to reduce the temperature of the apartment when it is high, and the quantity and warmth of the bedclothes; to remove all the excitants to the senses; to abstract the mind from all exciting, harassing, or engaging thoughts; and to remove or counteract the morbid conditions of which this is a symptom or prominent consequence."—Copland's *Dictionary of Medicine*, art. "Sleep and Sleeplessness." A careful regulation of the secretions, by the due use of purgatives and alteratives, will often remove this symptom; and recourse should not be had to anodynes and narcotics until morbid secretions and fecal accumulations have been completely got rid of. But these medicines are of great service when the system is thus prepared for their reception. The choice of the individual drug or combination of drugs must be dependent upon the peculiarities of the case, but, as a general rule, there is no more serviceable narcotic mixture for an adult than 25 or 30 minims of the solution of hydrochlorate of morphia (of the British Pharmacopœia), and 10 minims of chloric ether, taken in half a wine-glassful of water: medicines of this class should, however, never be resorted to without the advice of a physician.

SLEEP OF PLANTS. one of the phenomena of irritability (q. v.) in plants. Light acts on plants as a powerful stimulus, essential to their active and healthful vegetation. When it is withdrawn the flowers of many plants close, and the greater number show a tendency to it, while leaves more or less decidedly incline to fold themselves up. The leaf-stalk also generally hangs down more or less, although in some plants it is more erect during sleep. The sleep of plants, however, is not always nocturnal. The flowers of some open and close at particular hours of the day. Thus the crocus is a morning flower, and closes soon after midday; while some flowers expand only in the evening or during the night. Their hours of vegetative rest are probably as essential to the health of plants as those of sleep are to animals. It was Linnaeus who first observed the sleep of plants, in watching the progress of some plants of *lotus*, the seeds of which he had sown.

SLEEPERS, timbers laid *asleep* or resting along their whole length. They are chiefly used along the top of dwarf-walls for the support of the timbers of the ground floor of houses.—The timbers supporting railway rails, and laid at right angles to them across the railway, are also called sleepers.

SLEIDAN, or **SLEIDANUS**, JOHANN, original name Philipsohn, 1506-56; b. Sleida, near Cologne; studied law at Liège, Paris, and Orleans, but gave himself to classical literature. He became a Lutheran, resided in Strasburg, was made by the council of the town professor of law, and by the Protestant princes of the Smalkallic league their historian, and sent in 1545 on an embassy to France and England. His chief work is *De Statu Religionis et Reipublice Carolo Quinto Cezare, Commentarii*.

SLEMMER, ADAM J., 1828-68; b. Penn.; graduated at West Point in 1850; in the army was promoted for gallantry in the Seminole war; assistant professor of ethics and mathematics at West Point, 1855-59. At the outbreak of the rebellion he was in command of a small garrison at Fort McRea; took possession of fort Pickens, Jan. 10, 1861, which he held until relieved by col. Brown; brig.gen. of volunteers, 1862; fought at the siege of Corinth; severely wounded at the battle of Stone river, 1862, and disabled from further service; brevetted brig.gen. for gallantry, 1865.

SLES'WICK, a duchy known till the 14th c. as South Jutland, formed part of the Danish dominions till 1864, when it fell into the hands of the Austrian and Prussian sovereigns. In terms of the treaty of 1867 it was incorporated with Prussia. The pop. in 1864 was 406,486. Within its old recognized limits it was bounded on the n. by Jutland, on the e. by the Little Belt and the Baltic, on the w. by the German ocean, and on the s. by Holstein, from which it was divided by the Eyder and the Kiel canal. The area was 3,492 sq. miles. The country consists in its eastern and central parts of a gently undulating plain, deeply indented with fiords and streams; and on its western boundary of flat marshy tracts of ground, which require to be protected from the encroachments of the sea by numerous dams.

The numerous islands which skirt the w. coast of Sleswick have probably, at some not very remote period, formed part of the mainland, for navigation is so seriously impeded by the sand-banks, that this coast is now accessible for ships by only three passages. The cluster of small islands known as the Halligers, which lie, unprotected by dams, in the midst of these submerged sand-tracts, are so constantly exposed to the action of waves and storms, that the inhabitants are compelled to raise their houses on piles. On the eastern coast of Sleswick lie the islands of Alsen, Aroe, and Femern, where the principal bays and inlets are the Haderslev and Aabenrade fiords, opening into the Little Belt; the Flensborg fiord, the Slie, the Eckernförde fiord, and the

Kieler fiord, which formed the ancient boundary between Sleswick and Holstein on the s.e., while the Eyder completed it on the s.w. The principal branches of industry are agriculture, the rearing of cattle, fishing, and ship-building. The *Slie* is the chief seat of the herring and salmon fisheries, which, although still of some importance, are very inferior to those of the middle ages, when, according to the Danish historian, Saxo Grammaticus, herrings were so plentiful in the Belts and Cattegat, that they could be caught with the bare hands. The chief towns of Sleswick are Flensburg (q.v.), Sleswick, now capital of a Prussian province, a very ancient city, and formerly the key of Denmark (pop. in '75, 14,571); Haderslev, Husum, and Tønder. In the s., and partly in Holstein, Rendsborg (pop. 11,406). Sleswick has 800 schools. With regard to the language spoken by the mixed population of the duchy, it may be asserted that rather more than the half speak Danish; and of the remainder, about 30,000 persons who belong to the islands on the western coast, which once formed part of the old province of North Friesland, still use the Frisian language, the rest of the inhabitants using either low or high German. The original Danish element of Sleswick has remained purest in the northern half of the duchy; while in the southern parts, where the inhabitants are naturally brought much in contact with Holstein, they have of late years adopted the views, tastes, and language of their German neighbors. The Lutheran is the established religion of Sleswick.

In accordance with the conditions stipulated in the treaty of Vienna, Aug., 1864, by which the duchies of Holstein and Sleswick were ceded to Austria and Prussia, the island of Aroe and other districts of Sleswick, measuring about 115 sq.m., were to be reunited to Denmark; while the latter power was to give in exchange a territory of about 130 sq.m., which, although situated within the boundary of Sleswick, had hitherto been under the jurisdiction of Jutland.

Sleswick, which forms part of the ancient Cimbrian peninsula, has from the earliest period been a debatable land between Danes and Germans; and according to the authorities of the latter, it was anciently included in the marches of the empire, having been incorporated by Henry the Fowler in 930, and reorganized by Otto I., when in 948 the latter erected bishops' sees in Aarhus, Ribe, and Sleswick. In 1037 the Danish king Knud (our Canute) obtained from Conrad II. the recognition of the independence of Sleswick, which was declared to belong unconditionally to Denmark, and thenceforth given as a Danish fief of the crown to the younger sons of the regal house. In 1232, king Valdemar Seir, whose father, prince Knud Laward, had ruled ably over the duchy, gave Sleswick—which was then, and for some time later, known as South Jutland—to his younger son Abel. The exact terms of the donation became a subject of dispute, during the successive reigns of Valdemar's sons, Eric, Abel, and Christopher, and began the long course of civil wars and family feuds which are associated with this much-contested territory. Abel, and his sons after him, backed by their kinsmen, the counts of Holstein, maintained that Valdemar had given the duchy as an hereditary, inalienable, and indivisible fief; while, on the part of the Danish crown, it was contested that South Jutland was merely a *precarious* fief, which might be recalled at the pleasure of the sovereign. Its vicinity to Holstein tended to keep up the feuds, to which the vexed question of its mode of tenure had given occasion, and which, in fact, only ceased when the resources of the conflicting parties were exhausted, although the bitterness and ill-will with which they were fed seemed to know no intermission. The following brief summary gives the skeleton of the leading events of the history of Sleswick from the dawn of its troubles till the final outbreak in 1848, when, by the influence of the neighboring Holstein nobles, the Germanized great landed proprietors of Sleswick entered upon the course of armed opposition to the mother-country, which has culminated at the present moment in the forcible separation from the Danish crown of the duchy of Sleswick, and its imminent incorporation in the Prussian monarchy. In 1386, queen Margaret (q.v.) gave Sleswick in fief to Gerhard, duke of Holstein; and on the extinction of his male heirs in 1459, it virtually lapsed to the crown, with which it was united in 1460 under the rule of Christian I. (the founder of the Oldenburg line), by a mode disastrous to the integrity of the Danish monarchy. See DENMARK. After frequent division among the younger members of the royal house, which gave rise to a great number of collateral lines of the Oldenburg family (of which the Glucksburg-Sonderborg and the Augustenburg are, with the exception of the imperial house of Russia and the ducal house of Oldenburg, the chief representatives), the ducal portions of Sleswick were inalienably incorporated with the crown of Denmark under king Frederick IV. in 1721. This act, which had the guaranty of the great powers, had resulted directly from the treasonable attitude maintained in the previous wars with Sweden by the Holstein-Gottorp princes of Sleswick, and was ratified by Russia and Sweden, no less than by England and France. The different orders of the duchy took the oaths of allegiance for themselves and their heirs, the Sleswick arms were quartered with those of Denmark proper, and the duchy was included with the latter in one common mode of administration. In 1848, the revolutionary movement of continental Europe fanned the flame of discontent in the duchies into a blaze, and the upper classes of Sleswick, who had in the course of time become strongly imbued with the German tendencies of the Holstein nobles, with whom they fraternized, joined the latter in open armed rebellion under the

chief leadership of the princes of Augustenburg. The Germanized Sleswick nobles, influenced by the principles of hatred to Denmark, which had long been gathering strength in the university of Kiel, refused to admit the difference between their relations to the crown and those of the Holsteiners, with whom they demanded to be indissolubly associated in separate legislative and executive chambers. The king refused to separate Sleswick from the monarchy; the irritation increased on both sides; the royal troops appeared in the duchies to restore order; the Sleswick-Holstein army, whose ranks were principally filled by German volunteers, took the field, aided by the confederate forces sent by the diet to co-operate with the Holsteiners. The troubles by which the German states were threatened at home led, after a few indecisive engagements had been fought, to the withdrawal of the confederate armies, and Prussia having made a special treaty of peace (after a preliminary truce with Denmark), the duchies were left to themselves, and the royal authority re-established, on the understanding that the king should submit a new form of constitution for Holstein and Sleswick to the diet, on account of the former being a member of the confederation; Sleswick being in the meanwhile put under a provisional government of Danish, Prussian, and English commissioners. By the peace with Prussia, it was solemnly guaranteed that all old treaties, including that of 1721, should be maintained in regard to Denmark; and in 1851, Austria threw an army into the duchies to aid Denmark in supporting her authority, and in dissolving the joint Sleswick and Holstein assembly. On the death of Frederick VII. in 1863, prince Christian of Glücksburg (see DENMARK), having ascended the throne as Christian IX., king of Denmark, prince Frederick of Augustenburg called upon the Sleswick-Holstein authorities to refuse the oath of allegiance to the new king, and to acknowledge himself as the rightful duke of Sleswick-Holstein, basing his claims on his descent from the legitimate and elder male line of the house of Oldenburg. This appeal was responded to by 25 members of the Holstein diet, who, on behalf of their own duchy and of Sleswick, petitioned the German diet to recognize the validity of the claims of the Augustenburg line, and to pronounce the London protocol of the act of succession devoid of force. The prince, by this step, set at naught the family compact by which his father, uncle, and himself, for themselves and their heirs, had, at the close of the war of 1848, accepted a sum of money as full indemnity for all claims on the Danish territories, and been allowed on that condition to evade all further consequences of the open rebellion in which they had stood against the throne. In the meanwhile, the fundamental law of Nov., 1863, for the kingdom of Denmark and the duchy of Sleswick, which had passed the rigsråd, and received the late king's signature shortly before his death, was published, together with a manifesto of Christian IX., stating his intention in regard to Holstein and Lauenburg. The diet, without committing itself to uphold the Augustenburg claims, put a confederate execution into Holstein; the Danish troops were withdrawn into Sleswick; and on Jan. 6, 1864, the Holstein towns did homage to the duke; while a federal commission suppressed the provisional Holstein government, which had exercised its powers since 1862, and established a ducal government at Kiel. The Austrians and Prussians, professing to act for the diet, summoned the Danish king to withdraw the constitution of November within 48 hours; in reply to which the Danish government demanded a term of six weeks to convoke the rigsråd, without whose sanction no constitutional change could be adopted. The demand was rejected, and the Austro-Prussian army entered Holstein, and hostilities commenced. For ten weeks the Danes made a gallant stand against their enemy, whose enormous superiority in strength of numbers, and in the efficiency of their artillery and small-arms, made their final victory the inevitable rather than the glorious result of the campaign. The Danes were compelled to suspend hostilities, and to submit to the terms dictated by their conquerors. A conference was held at Vienna, and, after protracted negotiations, Denmark was constrained to accept peace (Aug., 1864), on the hard terms of ceding to Austria and Prussia, Holstein, Sleswick, and Lauenburg, on the ground that the indivisibility of the two duchies must be firmly established for the German fatherland by these two great powers. Following upon this, duke Frederick of Augustenburg was in turn the favored and the rejected candidate for the throne of the new state of Sleswick-Holstein. The upper classes in small numbers in Sleswick, in Holstein almost unanimously, were in favor of his claims, while the burgher and lower classes of Sleswick appeared equally unanimous in regretting their severance from Denmark; and the decidedly expressed wishes of the Holstein party, backed by the lesser German states, to have the duke as their sovereign, the protests and counter-protests of the diet and of foreign powers, all resulted in an announcement by Austria and Prussia that according to the evidence of the commission appointed to examine the merits of the various claims of Denmark, Augustenburg, and Oldenburg to the duchies, Christian IX. was by right of succession the undoubted possessor, and that from him the duchies had passed by right of victory to Austria and Prussia. Prussia sought to annex these duchies to her dominions, and offered Austria pecuniary compensation for her assistance in the war. On the other hand, Austria advocated the independence of the duchies. Neither country would yield, and the dispute ultimately resulted in the war of 1866. According to a treaty concluded in 1867, Austria abandoned her claims in favor of Prussia, but stipulated that a part of Sleswick should be restored to Denmark. This stipulation, however, has never been given effect

to. See GERMANY. The Prussian province of Sleswick-Holstein, formed out of the duchies of Sleswick and Holstein, has an area of 7,190 sq. m. and a pop. of (1875) 1,074,812.

SLICKENSIDES are the smooth and polished, and generally glazed, surfaces of flaws in rocks. They are considered to have been produced by the friction of the two surfaces during some movement of the rock. But the two surfaces of the flaw are almost always so uneven that it is impossible to conceive that they could have rubbed against each other; besides, the flaws are generally very small, and the true slickenside is always confined to a single stratum, never passing into the bed above or below. We believe they are the castings of liquids or gases confined in the bed, and subjected to great pressure, and are similar in origin to the glazed cavities produced by gases in slags, or, to use a very familiar illustration, by the compressed steam in breakfast rolls.

SLIDELL JOHN, 1793-1871; b. N. Y.; educated at Columbia college. Settling in New Orleans he became distinguished at the bar; was a member of Congress, 1843-45, when he was appointed minister to Mexico; was elected to the U. S. senate for a partial term in 1853, and afterward re-elected. He left the senate on the passage by Louisiana of the act of secession in 1861; the same year was appointed commissioner to France, ran the blockade to Havana, from which, with Mason, commissioner to England, he sailed on the British mail steamer *Trent*, which was boarded, Nov. 8, by capt. Wilkes, of the U. S. steamer *San Jacinto*, who arrested both the commissioners. They were confined in fort Warren, Boston, but released on the demand of the British government, and sailed for England. Slidell succeeded in obtaining some help for the confederates in Paris. He settled in London at the end of the war.

SLIDING RULE, an instrument invented by the rev. William Oughtred, an English divine and mathematician, for the purpose of solving arithmetical problems mechanically, consists of three pieces of wood, of which two are fastened together by slips of brass at a sufficient distance from each other to permit of a third sliding between them. The size of instrument which best combines convenience with accuracy is one about 2 ft. long, 2 in. broad, and $\frac{1}{4}$ in. thick. One side of the rule has the following scales marked on it in order: a line of tenths of in., of equal parts divided into tenths and hundredths of ft.; three lines of numbers, each line consisting of the numbers from 1 to 10 twice repeated; a line of sine rhumbs (logarithmic sines of each quarter-point of the compass); a line of meridional parts; and a line of equal parts. Of these, two of the lines of numbers are on the middle piece or *slider*. On the other side are—two lines of *natural scales*, including sines, secants, tangents, equal parts, etc.; two lines of logarithmic sines, two lines of logarithmic tangents, a third line of logarithmic sines, and a line of versed sines. Of these, one line of logarithmic sines and one of tangents are upon the slider. The scale in most common use is that of numbers, and a description of the way in which it is used will give a key to the whole working of the instrument. It is necessary, however, to notice as a preliminary, that the scale of numbers is not evenly divided, as in this case only addition and subtraction could be performed, but is divided in proportion, not to the numbers, but to their logarithms, so that 3, whose logarithm is very nearly the half of that of 10, stands almost half-way between 1 and 10; and similarly of the other numbers. All questions of numerical proportion can thus be easily worked by means of the line of numbers on the slider, and the adjacent and corresponding one on the fixed part of the rule. To find a fourth proportional to three given numbers, we place the first term (on the slider) opposite to the second term (on the fixed scale), and opposite the third term (on the slider) is the fourth or number required (on the scale). Multiplication is performed by making 1 the first term of a proportion, and division by making it the second or third. The other scales marked on the rule are useful in the solution of trigonometrical, geographical, and nautical problems, and the results obtained are much more accurate than one at first sight would believe. Sliding rules of circular form have been made by the French, but they are not in any way preferable to the ordinary straight form.

SLIDING SCALE, a provision in some of the statutory restrictions formerly in force on the trade in corn, by which, in order to encourage importation when prices were high, and discourage it when low, the import duty was diminished as the price rose, and at famine-prices grain came in duty free. By the act of 1828 wheat was allowed to be imported on payment of a duty of £1 4s. 8d. when the average price over England was 62s. a quarter. For every shilling less of price, a shilling was added to the duty; and for a rise of price, the duty decreased. In 1842, while the agitation regarding the corn-laws was going on sir Robert Peel introduced and carried a modification of the sliding scale, which, however, did not succeed in mitigating the popular hostility to the corn-laws. By the sliding-scale act of 1842, the duty per quarter was fixed at £1 when the price of corn was under 51s., and diminished as the price increased, till on the quarter of wheat attaining the price of 73s. it fell to 1s. See CORN LAWS.

SLIGO, a maritime co. of the province of Connaught, Ireland, bounded on the n. by the Atlantic and the bay of Donegal, s. by Roscommon and Mayo, e. by Roscommon and Leitrim, and w. by Mayo. It is 41 m. from e. to w., and 38 from n. to s.; the total area is 461,796 acres, of which about 320,000 are under tillage or in pasture, and

140,000 uncultivated. Thé pop. in 1861 was 124,845; in 1871, 115,493, of whom 104,429 were Roman Catholics, 9,185 Protestant Episcopalians, and the rest of other denominations. The coast-line is indented with numerous bays, and except in the bay of Sligo, dangerous for navigation. The surface rises gradually from the coast eastward as far as an elevated range called Slieve Gamph and the Ox mountains, the highest point of which rises to 1800 feet. Sligo contains comparatively few and unimportant lakes, but some of these, however, are extremely picturesque, especially lough Arrow and lough Gill. Only three of its streams are navigable—the Moy, the Owenmore, and the Garrogue, and they are all inconsiderable. The county is traversed by a railway, which is a branch of the Midland Great Western, and connects the county town of Sligo (q.v.) with Dublin. The mineral products of the county, although not very rich, are various, and consist of copper, lead, iron, and manganese. The climate is variable, and although rain is frequent, it is, on the whole, mild and healthy. The soil in the n. is mossy and sandy, both being occasionally intermixed, and at times alternating with a gravelly loam. The plain of Sligo is a deep rich loam; and in the southern portion of the county are found large tracts of corn-land and pasturage. The occupations of the people are mainly agricultural, and until some years back, they were chiefly engaged in tillage; but the land is now chiefly used for pasturage. The number of acres under crops of all kinds in the year 1877 was 89,231. The cattle in that year numbered 93,295; sheep, 59,404; and pigs, 25,932. The number of holdings ten years before 1852 had been 13,992, which is now somewhat reduced. The extent of coast-line has led a considerable number of the population to engage, at least partially and occasionally, in fishing. The Sligo fishery district comprises 112 m. of coast, and kept engaged in 1876, 159 registered vessels, employing 650 men and 38 boys. The principal towns are Sligo (q.v.), Ardarae, and Tobercurry. The number of primary schools in the county in 1871 was 206; superior schools, 12. In 1875 there was, at the national schools, an attendance of 22,345 pupils, of whom 20,978 were Catholics.

Sligo was anciently the seat of the O'Connors, and was the scene of many conflicts between the several branches of that family. The domestic feuds of the O'Connors were among the causes which facilitated the first inroads of the Anglo-Normans. The district contains many remains both of the Celtic and of the Anglo-Norman period. Of the former, there is one very interesting called the Giant's Cairn, near Sligo; and there are many raths, cromlechs, and ancient caverns. The county of Sligo sends two members to the imperial parliament.

SLIGO, chief t. of the co. of the same name, situated on the river Garrogue; distant from Dublin, with which it is connected by a branch from the Midland Great Western railway, 131 m. n.w. Pop. '61, 13,361; '71, 10,670, being a decrease in ten years of 2,691. There were 8,220 Roman Catholics. Sligo had its origin in the erection of a Dominican abbey in the 13th c. by Maurice Fitzgerald, earl of Kildare, around which—and a castle also built by him—a town was gradually formed. In the reign of James I. it received a charter. The modern town stands within a bend of the river, chiefly on the left bank. It is for the most part well built, and contains several handsome public edifices. It possesses few important manufactures, but is a place of considerable commerce, which is directed with judgment and energy by a body of town and harbor commissioners. In 1877 923 vessels, of 145,633 tons, entered and cleared the port. The exports are chiefly of corn, flour, meal, butter, provisions, and yarn. Steamers ply regularly between Sligo and Glasgow, Liverpool, and Londonderry. Sligo formerly returned a member to parliament, but was disfranchised in 1870.

SLING, a weapon much in use before the introduction of firearms, consisted of a piece of leather, with a round hole in the middle, and two cords of about a yard in length. A round pebble being hung in the leather by the cords, the latter were held firmly in the right hand, and swung rapidly round. When the stone had attained great speed, one string was disengaged, on which the stone flew off at a tangent, its initial velocity being the same as it had at the last moment of revolution. This velocity gives far greater range and force than could be imparted in mere throwing.

SLIP, in a dockyard, is a smooth, inclined plane, sloping down to the water, on which a ship is built. It requires to have a very solid foundation. Among modern inventions is a slip on which a sort of truck runs on numerous rails. This truck is run under a ship as she floats; the water is diminished till she rests on it, and it is then hauled up the slip by steam power until she is high and dry. Such a slip takes the place of a dry dock. See also LAUNCH and SHIP-BUILDING.

SLIPPED, in heraldry, a term of blazon applied to a leaf, branch, or flower, which is represented with a stalk, and torn from the parent stem.

SLOAN, SAMUEL, b. Ireland, 1817; brought to New York, 1819; received a common school education; after holding office in King's co., N. Y., was elected president of Hudson River railroad company, 1855; and president of the Delaware, Lackawanna, and Western railroad company, 1863; which last office he still holds. He is also president of railroads in Michigan and Texas.

SLOANE, Sir HANS, an eminent physician and naturalist, of Scotch parentage, his father having been the chief of the Scottish colony which was settled in Ulster by

James I. of Great Britain, was born at Killyleagh, in county Down, Ireland, April 16, 1660. He devoted himself during his boyhood to natural history and medicine, and in spite of an attack of hæmoptysis, which lasted from his 16th till his 19th year, he arrived in London in 1679, with an excellent knowledge of the first of these sciences, and a fair acquaintance with the second. His apprenticeship to Stafforth, a pupil of Stahl (q.v.), and the acquaintance, subsequently ripened into close friendship, which he formed with Boyle and Ray, two of the most celebrated naturalists of their time, did much to encourage and advance him in his favorite studies. During a brief sojourn in France he attended the lectures of Tournefort and Du Verney, obtained on his return, by the active support of Sydenham (q.v.), a footing in London as a physician, and was elected a member of the royal society in 1685, and of the royal college of physicians in 1687; but in September of the latter year, he accompanied Monk, duke of Albemarle, to Jamaica, and investigated the botany of that and the adjoining islands with such zeal and diligence during the 15 months of his stay, that his herbarium numbered 800 species. Resuming his professional practice on his return, he became physician to Christ's hospital (1694-1724), president of the college of physicians (1719-1755), secretary to the royal society (1693), foreign associate of the French academy of sciences (1708), and succeeded sir Isaac Newton as president of the royal society in 1727. He had been created a baronet and physician-general to the army in 1716; and in 1727 received the further honor of being appointed royal physician. Though of remarkably delicate constitution he lived to the great age of 92, dying at Chelsea, Jan. 11, 1753. The chief point to be remarked in Sloane's moral character was his benevolence, as shown in the charitable uses to which he applied the whole of his salary as physician of Christ's hospital, in his zealous promotion of the various schemes for affording medicine and attendance gratuitously to the poor, and his support of the foundling hospital, of which he was one of the founders. By long-continued perseverance he succeeded in forming a most extensive museum of natural history, a library of 50,000 volumes, and 3,560 MSS., which he directed to be offered at his death to the nation for £20,000 (about one-fourth of its real value), and which formed the commencement of the British Museum (q.v.). He also contributed numerous memoirs to the *Philosophical Transactions*, whose publication he superintended for a number of years. But his great work was the *Natural History of Jamaica* (fol. 1707-1725), containing also an excellent account of the topography, meteorology, and population of the island, which book was the means of introducing into the pharmacopœia a number of excellent drugs, hitherto unknown.

SLOAT, JOHN DRAKE, 1780-1867; b. New York city; entered the navy as sailing-master, 1800; was in the engagement between the *United States* and the *Macedonian*, 1812. He participated in the expedition against the West Indian pirates, 1824-25; commanded the Pacific squadron, 1846-52; was commandant at the Norfolk navy yard, and superintended the building of Stevens's battery at Hoboken; retired with the rank of commodore, 1862; rear-admiral, 1866.

SLOCUM, HENRY WARNER, b. N. Y.; 1827; graduated at West Point, 1852; was lieut. in various military services, 1852-56; became a lawyer at Syracuse, and was in the state legislature, 1859; appointed col. of the 27th N. Y. regiment, which he led at Bull Run where he was severely wounded; made brig.gen. of volunteers, and after his recovery commanded a brigade in Franklin's division of the army of the Potomac in campaign of 1862; was at the siege of Yorktown; commander of the division on Franklin's transfer to the 6th corps; at the battle of Gaines's mill rendered important service; at Glendale and Malvern Hill held the right of the main line; maj.gen. of volunteers July 4th, and engaged at second battle of Bull Run, South mountain, and Antietam; in October made commander of 12th corps which he led at Chancellorsville and Gettysburg in command of the right wing of the army; April, 1864 was placed in command of the district of Vicksburg; in August succeeded gen. Hooker in command of 20th corps; in Sherman's march to the sea, commanded the left wing of the army—participating in all the engagements to the surrender of Johnson. After the war was a member of the 41st and 42d congress.

SLOBODSK', or SLOBODSKO', a t. of Russia, in the government of Viatka, is situated on the river Viatka, about 16 m. n.e. of the town of the same name. Pop. '67, 6,904.

SLOE, or SLOE-THORN, *Prunus spinosa*, a shrub of the same genus with the plum, and perhaps really of the same species with it and the bullace. It is generally a shrub of 4 to 10 ft. high, sometimes becoming a small tree of 15 to 20 feet. It is much branched, and the branches terminate in spines. The youngest shoots are covered with a fine down. The flowers are small, snow-white, and generally appear before the leaves. The fruit is ovate, or almost globose, pale blue with blackish bloom, and generally about the size of the largest peas. The sloe is abundant in thickets and borders of woods, and in arid places in Britain and almost all parts of Europe. The shoots make beautiful walking-sticks. Although spiny, the sloe is not suitable for hedges, as its roots spread, and it encroaches on the fields. The bark is bitter, astringent, and tonic. The flowers, with the calyx, are purgative, and are in some places much used as a domestic medicine. The leaves are used for adulterating tea. The unripe fruit dyes black. The fruit is very austere. It is much used on the continent of Europe for making a preserve, also in some places for making a kind of brandy. An astringent extract, called *German aceacia*,

is prepared from it, which was once much employed in cases of diarrhea and mucous and bloody discharges. The juice is much used to impart roughness to port wine, and in the fabrication of spurious port.

SLO'NIM, a t. of European Russia, in the government of Grodno. and 72 m. s.e. of the town of that name. It has large manufactures of cloth. Pop. '67, 10,166.

SLOOP is a one-masted cutter-rigged vessel, differing from a cutter, according to old authorities, in having a fixed bowsprit and somewhat smaller sails in proportion to the hull. The terms "sloop" and "cutter" appear, however, to be used nearly indiscriminately. In the British navy, a sloop-of-war is a vessel, of whatever rig, between a corvette and a gun-boat, and ordinarily constituting the command of a commander. In the days of the sailing navy, sloops-of-war carried from 10 to 18 guns; but, with the introduction of steam, the number of guns has ceased to be distinctive.

SLOPS, in the navy, are somewhat more extensive than "necessaries" in the army. They comprise the clothes and bedding of a sailor. Within certain limits, government, acting through the ship's paymaster, supplies the men with slops at cost-price. When a sailor dies, his slops are sold by auction for the benefit of his representatives.

SLOTH, *Bradypus*, a genus of mammalia, of the order *edentata*, and family *tardigrada*. The name was given from observation of the very slow and awkward movements of the animals of this genus on the ground; but a better acquaintance with their habits, and observation of their movements among the branches of trees, for which their conformation peculiarly adapts them, have shown it to be by no means appropriate or descriptive. In like manner, Buffon's notion that they are creatures of imperfect organization, and doomed to a miserable existence, has been completely exploded. Their structure, like that of every other creature, is admirably adapted to their mode of life. They feed on the leaves, buds, and young shoots of trees, among the branches of which they are born and spend their whole life, rarely and unwillingly descending to the ground. They do not walk upon the branches, but cling beneath them, with the back downward. The fore-legs are much longer than the hinder ones, and are used for embracing a branch, or for drawing in the branches on the foliage of which they are to feed, and both the fore and hind feet are furnished with very long, curved, and sharp claws. The pelvis is very wide; and the hind-legs, thus widely separated, also diverge from one another. The structure of the wrist and ankle-joints is such that the palm or sole is turned toward the body, so that upon the ground, the animal is compelled to rest on the side of the hind-foot, while the length of the fore-legs causes it to rest on the knee or elbow of them, struggling forward by a shuffling movement, and dragging itself along by stretching out the fore-legs alternately and hooking the claws into the ground, or grasping some object. But in a dense tropical forest, sloths generally find it easy to pass from the branches of one tree to those of another, often taking advantage for this purpose of a time when branches are brought within their reach by the wind. Where the trees are more distant from each other, they will eat up the whole foliage of a tree ere they descend from it. The hair of sloths is coarse and shaggy, of a very peculiar texture, inelastic, and much like grass withered in the sun, but affords an excellent protection from insects, while it also gives them such an appearance that they are not readily observed except when in motion. The muzzle of sloths is short, and the tail is short. There are no incisor teeth, but sharp canine teeth, and eight molars in the upper, six in the lower jaw. The molars are cylindrical, penetrated by no laminae of enamel, and adapted merely for crushing, not for grinding, the food. For this, however, there is compensation in the stomach, which is somewhat imperfectly divided, by transverse ligatures, into four compartments, for the longer retention and more thorough digestion of the food, although there is no rumination. The female sloth produces only one young one at a birth, which clings to its mother till it becomes able to provide for itself. The voice of sloths is a low plaintive cry. Their chief enemies are large snakes, but against these they defend themselves by their powerful fore-legs and claws. A sloth has been known to grasp a dog round the neck and strangle it. There are very few species. One species has the fore-feet furnished with only two toes; the others have three. These, with other differences, have been made the ground of a recent division of the genus into two. The **TWO-TOED SLOTH** or **UNAU** (*Bradypus* or *Cholepus didactylus*) is about two ft. in length, of a uniform grayish-brown color, often with a reddish tint. The best known species of **THREE-TOED SLOTH** is the **AI** (*Bradypus* or *Acheus tridactylus*), which is smaller than the Unau, has a more obtuse muzzle, and is generally brownish gray, slightly variegated with hairs of different tints, the head darker than the body. All the sloths belong to the tropical parts of America.

SLOT TING-MACHINE, a machine for cutting slots, or square grooves, in metal. It is of great importance in mechanical engineering, and many very ingenious inventions have been made for facilitating the process. The principle is, however, very simple, and is the same in all. It consists of a cutting tool, or chisel, held very firmly in an arm, which is pressed down and raised alternately. The tool is thus made to pare off a thin portion of the metal each time it descends, until it has cut a slot of sufficient size. Water is continually thrown on to prevent the metal from becoming overheated by the friction.

SLOUGH, a village of England, in the county of Buckingham 18 m. w. of London, by the Great Western railway. On the road between Slough and Windsor, which is distant about 2½ m., lived sir William Herschel, and at the observatory which he erected here, in which was placed his great telescope, many of his important astronomical discoveries were made. Pop. '71, 4,509.

SLOVAKS, THE, are the Slavic inhabitants of north Hungary, who in the 9th c. formed the nucleus of the great Moravian kingdom, but who, after the bloody battle of Presburg (907 A.D.), were gradually subjugated by the Magyars, to whom even yet they bear no friendly feeling. The Slovaks who are of a soft, pliant disposition, and industrious character, number about 1,900,000, and are mostly Catholics. The Slovaks whose character probably comes nearest to that of the old Slavic type, travel in great numbers over Germany and Poland as pedlers. Their language is a dialect of Bohemian. Among the most notable of the Slovak authors are the poets Holly and Kollar (q.v.); Matth. Bel (1684-1749); Stephan Leschka (1757-1818), editor of the first Slovak journal; Bernolak, author of a Slovak grammar; Palkovitsh (died 1835); and Tablitsh, who published four volumes of poetry (1806-12). A fine collection of popular Slovak ballads has been published by Kollar (2 vols., Ofen, 1834).

SLOVENTZI, or VINDS, a south Slavic race found in Hungary and other Austrian provinces, numbering 1,260,000 chiefly Roman Catholics of the Latin rite. They are sometimes confounded with the Wends, who are a distinct though remotely kindred people. The language, related to the Servian, is written in Roman characters, and at the rise of the reformation, was beginning to receive literary culture. There is some recent literature, chiefly religious.

SLOW-MATCH, a combustible material, such as cotton, hemp, tow, etc., often dipped in a solution of nitrate of potash (saltpeter), and formed into a thin rope. It is used for exploding gunpowder in various ways on account of its slow, steady way of burning, a sufficient length being taken to enable the operator to remove to a safe distance before the explosion. Slow-match was much used by artillerymen for firing of cannon, but it has generally given way to friction fuses and percussion caps.

SLUBBING. See SPINNING.

SLUG, *Limax*, a genus of gasteropodous mollusks, of the division *monæcia* (hermaphrodite), and of the family *limacidae*, which is closely allied to the snail family, *helicidae*, but has no external shell. There is, however, a rudimental shell, generally concealed within the mantle, placed over the respiratory cavity. The *limacidae* are diffused over the whole world. They commit great ravages among field and garden crops during moist weather. In frosts they become dormant, taking shelter under clods and at the roots of plants. They lay eggs in clusters in moist places, often at the roots of grass. The eggs resemble small oval bags of jelly. The body is generally oval or oblong, elongated. The foot is not distinct from the body. There are four retractile tentacles; the eyes are at the tips of the longer pair. Slugs often climb trees in quest of decaying vegetable matter on which to feed, and let themselves down by means of mucous threads, for the formation of which there is a small aperture at the hinder end of the body. Of British species, one of the most common is the GRAY SLUG (*limax agrestis*), which is of a whitish ash color; another is the GREAT GRAY SLUG (*L. maximus* or *antiquorum*), the largest British species; another is the BLACK SLUG (*L. ater*), often popularly called the black snail. The RED SLUG (*agrium agrestis*) is also very plentiful. Careful gardeners often gather slugs by the aid of a lantern at night, and destroy them. They may also be killed by watering the ground with a weak solution of ammonia.

SLUR, in music, an arch drawn over two or more notes *not* on the same degree, to indicate that these notes are to be played *legato*, or smoothly and fluently

In vocal music, a slur is placed over all the notes that are to be

sung to the same syllable, unless where they are grouped together by a common line. A slur must be distinguished from a *tie*, which is a similar arch drawn over two notes on the same degree, and denoting that instead of the two notes written, one is to be played of the length of both.

SLUTSK, a t. of European Russia, in the government of Minsk, about 63 m. s. of the town of that name, near the source of the lesser Slutch. With the exception of its public buildings, the houses are almost entirely of wood. Pop. '67, 9,647.

SMACK is a generic term for small decked or half-decked vessels employed in the coasting and fishing trade. The majority of smacks are, however, rigged as cutters, sloops, or yawls. According to Wedgewood the *m* in this word is a corruption of *n*; the Anglo-Saxon has *snakk*, a small vessel, and there is a corresponding form in the other Teutonic and Scandinavian tongues.

SMALCALD. See SCHMALKALD, *ante*.

SMALL-ARMS, in the modern acceptation, consist of the weapons actually carried by a man. They have been described under their respective heads, BAYONET, FIRE-ARMS, LANCE, SWORD, PISTOL, etc.

SMALL-ARMS FACTORIES, ROYAL, are the establishments through which all the small arms of every description are supplied to the regular army, the militia, yeomanry, and volunteers. The headquarters are at Entfield, where there is a vast manufactory; and at Birmingham there is a considerable establishment for viewing the arms supplied by contractors. For many years there had been a small ordnance factory at Entfield lock, where a few thousand muskets were laboriously forged by hand each year; but when the sudden introduction of the rifle, and the demands of the Russian war, called for a supply of arms, which the trade of all Europe and America was unable to meet, government determined to erect machinery for the fabrication of arms. For this purpose the factory at Entfield was entirely remodeled; machinery of great power and delicacy was adopted; and now, when in full work the factory can turn out daily 1000 complete and proved rifles, besides a corresponding complement of other small-arms. At the same time the accuracy of workmanship is so great that a hundred rifles might be taken entirely to pieces, the several portions thrown promiscuously together, and a hundred complete rifles could be forthwith re-formed without any difficulty from the same pieces. Much of the merit of this great establishment was due to maj. gen. Manky Dixon of the royal artillery, who long superintended the factory after it was remodeled. The success of the factory has reduced in a remarkable degree the cost of rifles, and has brought down correspondingly the price charged by the trade for the large quantities still intrusted to it. The successive adoption of the Snider and Martini rifles has been the means of producing a great change in the plant at Entfield.

The cost of the factories when in full operation is of course considerable. In the year 1874, when the army was being armed with the Martini rifle, the charge was £173,837; in 1873, £153,673.

SMALL DEBTS is a phrase current in Scotland to denote debts under £12, recoverable in the sheriff court. See SHERIFF. In England the same debts are recoverable in the county court (q.v.).

SMALL-POX, or **VARIOLA**, is one of the most formidable of the class of febrile diseases known as the *exanthemata* (q.v.). All cases of regular small-pox are divisible into three stages—viz.: (1), that of the initial or eruptive fever; (2), that of the progress and maturation of the specific eruption; and (3) that of the decline. Some writers make a primary stage of the period of incubation, or of the time intervening between the reception of the poison into the system, and the first appearance of febrile symptoms; but this is not entitled to be regarded as a stage of the disease, seeing that no symptoms of disorder have begun to show themselves. The *first stage* begins with rigors, followed by heat and dryness of the skin, a quickened pulse, furred tongue, loss of appetite, pain in the pit of the stomach, with nausea, vomiting, headache, and often pains in the back and limbs. The violence of the pains in the back, and the obstinacy of the vomiting, are frequently very well marked and characteristic symptoms. In children, the disease is often ushered in by convulsions; while delirium sometimes attends its outset in adults. On the third day, minute red specks begin to come out first on the face, then on the neck and wrists, and on the trunk of the body, and lastly, on the lower extremities. The fever usually begins to subside as soon as the eruption appears, and by the beginning of the fifth day, when the eruption is generally completed, the fever has entirely disappeared. The *second stage* commences when the eruption is fully out. Upon the second or third day of the eruption, a little clear lymph is seen in each pimple, which has increased considerably in size since its first appearance, and which is thus converted into a *vesicle*. The vesicles gradually increase in breadth, and become converted into *pustules*, which are at first depressed in the center, but by the fifth day of the eruption become turgid and hemispherical; the suppuration on the face being complete by about the eighth day from the commencement of the fever, and the same process rapidly following in the other parts of the body in the same order of succession as that in which the eruption originally appeared. The pustules then break, and scabs or crusts form over them, which usually fall off after four or five days' existence. The number of pustules in any special case and the severity of the disease, stand in a direct ratio to one another; for the number of pustules indicates, in the first place, the quantity of the variolous poison which has been reproduced in the blood; and, in the second place, it is also a direct measure of the extent to which the skin suffers inflammation. Sometimes there are not more than half-a-dozen pustules; sometimes there are many thousands. If all these were collected into one, it would be an enormous phlegmon. For both these reasons, the system suffers commotion, distress, and peril, in proportion to the quantity of the eruption."—Watson's *Lectures*, etc., 4th ed. vol. ii. p. 857. The progress of the pustules is usually accompanied with swelling of the skin of the face, with a painful sensation of heat and tension; the scalp is often swollen; soreness of the mouth and salivation usually supervene; and the patient exhales a peculiar and disagreeable odor. About the eighth or ninth day of the disease, a recurrence of the fever, known as "the fever of maturation," sets in with varying degrees of intensity, according to the number and arrangement of the pustules. When the pustules are numerous, they run together; when they are few, they keep

separate. Hence the division of small-pox into the two great varieties of *distinct* and *confluent*, or *variola discreta* and *variola conflens*; and this division is of the highest importance, because the distinct form of the disease, in which the pustules are isolated, is scarcely ever dangerous; while the confluent form, in which they coalesce, is never free from danger. The *third or declining stage* is, in the distinct variety, little more than a period of convalescence. About the eleventh or twelfth day, the pustules on the face become brown and dry at the top, or some of them break, and the fluid which oozes out solidifies into a yellowing crust; and from this time the process of *desiccation* goes on, the swelling of the face subsides, and at last only dry scabs remain, which gradually fall off about the fourteenth day. It is not till three or four days after the scabs have formed on the face, that the same process is completed over the whole body. The scabs are usually completely gone by the twenty-first day, leaving behind them blotches of a reddish brown color, which sometimes continue for some months before they quite disappear; and some of the pustules, in consequence of ulceration of the true skin, leave pits, especially on the face, which remain permanently. The period of scabbing is accompanied by various symptoms of improvement: the tongue becomes clean, the appetite returns, and by the time that the scabs have fallen off, the patient may be regarded as restored to health; so that the entire course of a case of distinct or discrete small-pox occupies about three weeks. In the confluent form of the disease, the eruptive fever is more violent, the pain in the back is more severe, and the sickness more obstinate, and the eruption comes out earlier and less regularly than in the distinct variety which we selected for description as representing the more natural course of the disease. Moreover, the pustules do not fill so completely, nor are they of the normal yellow purulent hue, being whitish, brown, or even purple. But the most important difference between the two forms is in the *secondary fever*, which sets in when the pustules are mature. This fever, which is slightly marked in distinct small-pox, is usually intense, and highly dangerous in the confluent form; and it is at this period of the disease that death most commonly occurs. Statistics show that the eighth day of the eruption is the most perilous *day*, and the second week the most perilous *week*. The early occurrence of death—that is to say, during the first week—denotes a peculiar malignancy in the disease. "The nervous system," says Dr. Watson, "appears to be overwhelmed by the force of the poison. During the second week, the disorder proves fatal chiefly in the way of apnea; from some affection of the respiratory passages. After that period, the characters of asthenia commonly predominate, the patient sinks under some casual complication, or the powers of life are gradually worn out by so much irritation of the surface, and so large an amount of suppuration."—*Op. cit.*, vol. ii. p. 869.

The above are the essential symptoms of small-pox, both in the distinct and confluent form. This disease is, however, often accompanied by other symptoms, which we have merely space to name; such as sore throat (which often depends upon pustules situated there), salivation, and (in the confluent form, during the secondary fever) erysipelatous inflammation, leading to the formation of abscesses, glandular swellings, sloughing sores on the sacrum, etc. In pregnant women, the disease often causes abortion, which is most commonly followed by death. The dead child occasionally, but not often, is covered with pustules.

The *cause* of small-pox is universally allowed to be a specific contagion, of whose nature we are in the most profound ignorance. There is probably no disease so contagious as this. Dr. Hygarth stated (in 1793) that, during his long attention to this subject, not a single instance has occurred to prove that persons liable to small-pox could associate in the same chamber with a patient in the distemper without receiving the infection; and he was informed by an American physician of an instance in which the poisonous effluvia crossed a river 1500 feet wide, and affected 10 out of 12 carpenters who were working on the other side. The contagion acts either through the air, or by contact with the skin, or by inoculation; and the disease may be caused by the dead body, even when it has not been touched. What products of the diseased body are contagions is not exactly known, but the contents of the pustules and the dried scabs certainly are so. Opinions are divided as to the period at which the disease begins and ceases to be contagious. It is safest to maintain that it is capable of self-propagation as soon as the febrile symptoms have exhibited themselves. How soon the patient ceases to be dangerous, cannot be decided with accuracy; but the stability of the contagious principle may be inferred from the fact, that clothing will retain it for months, and it is said for years, when confined. Like all the contagious exanthemata, small-pox appears in an epidemic form, at irregular, and, in our ignorance, it would almost seem capricious intervals. After an extraordinary exemption, perhaps for years, a district is suddenly invaded by it, and continues to suffer for a longer or shorter period, after which the disease spontaneously disappears—dies out, as it were—and does not reappear perhaps for years. Different epidemics vary very much in their severity, and isolated cases are usually milder than those occurring when the disease is epidemic. Race has much to do with the severity of the disease; the constitution of the dark races, the negro and the red Indian, being singularly susceptible of the contagion, and exhibiting very little power of resisting the fatal tendency of the disease.

It is universally admitted that the discovery of *vaccination* (q.v.), by which small-pox is deprived of its danger, is the greatest triumph of modern medicine. *Inoculation* (q.v.)

protected the individual, but increased rather than diminished the total number of deaths, while vaccination has the advantage of protecting both the individual and the community. Although, in the great majority of cases, vaccination affords perfect protection against small-pox, it not very unfrequently happens that vaccinated persons, when exposed to the contagion of small-pox, get the disease in a modified form, milder and shorter even than after inoculation, and therefore incomparably milder than in the natural form. The disorder occurring under these circumstances has received the various names of *modified* or *post-vaccinal* small-pox, or the *varioid* disease. As Dr. Wood observes: "It is impossible to describe minutely all the shapes which the varioid disease assumes. There is every shade between the slightest symptoms, scarcely recognizable as having affinity with small-pox, and the nearest possible approach to the regular disease."—*Practice of Medicine*, 4th ed., vol. i., p. 380. In whatever form the varioid disease appears, it wants the peculiar odor of small-pox, and secondary fever is very rare. The constitutional disturbance which, for the first week, may have been as severe as in the true disease, usually subsides entirely when the eruption has reached its height, and the patient is convalescent at the period when, if he had not been vaccinated, he would have been in the greatest danger.

With regard to prognosis, it may be stated generally, it is a very fatal, and was formerly an extremely destructive disease—one death occurring in every four cases. Modified small-pox is very seldom fatal, although instances of death are occasionally reported. Small-pox is more fatal at the two extremes of life than in the intervening period, and, as has been already noticed, is especially dangerous in pregnancy. In olden times, it was believed that the eruption was an effort of nature to get rid of the noxious matter, and hence heating and stimulating measures were adopted with the view of promoting the eruption. To Sydenham (q.v.) belongs the credit of first recommending an entirely opposite or cooling mode of treatment; but his suggestions met with the most severe opposition, and it was not till long after his death that the cooling treatment was fairly established. In mild cases, and in cases of varioid disease, the physician has merely to guard the patient against hurtful influences, such as stimulating foods or drinks, too hot a room, or improper exposure to cold, and to prescribe cooling drinks during the fever, and occasional laxatives if they shall be required. In more severe cases, the fever may be combated by saline purgatives, prescribed so as to produce two or three liquid stools daily, and by free ventilation of the surface of the body. When the eruption is all out, if the pimples on the face are few and distinct, the danger may be regarded as over, and no further treatment is required. If, however, the disease assume a confluent form, wakefulness and restlessness are apt to come on about the eighth day, and opiates in free doses may be prescribed with benefit. If the pustules are abnormally torpid in reaching their maturity, it may be expedient to administer strong broths, or even wine; and when the pustules are livid, and intermixed with petecchiæ (q.v.), bark and acids must then be additionally ordered, although the patient is then too often beyond the reach of help. During the secondary fever, the bowels must be kept gently open, and opiates should be prescribed once or twice each day. A more nourishing diet is now called for, and wine should be given if the pulse is very weak. The external itching is partly relieved by the opiates, but local applications are also employed: cold cream, or a mixture of equal parts of olive oil and lime-water, may be thus used with advantage. Special methods have been devised for the purpose of preventing the pitting or seaming of the face, which is often a hideous permanent disfigurement of the patient. The best application of this kind is probably that of nitrate of silver. Mr. Higginbottom, who first suggested this application, touched each distinct papula with a solid stick of lunar caustic, previously moistened; but when the spots were confluent, he washed the whole face, about the third day after the eruption, with a strong solution of this salt, containing eight scruples to the ounce of water. In the Paris hospitals, various mercurial preparations are employed, which are said to cause the pustules to abort. M. Briquet recommends mercurial ointment, simply thickened with powdered starch. Dr. Wood of Philadelphia remarks, that as the ointment sometimes salivates, it should be diluted with an equal quantity of lard before the starch is added. Prof. Bennett of Edinburgh recommends the application of calamine (carbonate of zinc) mixed with olive oil; it forms a coherent crust, and thus excludes the air.

During the period of desquamation, an occasional warm bath may be prescribed with advantage; and the patient should always resort to this measure, as a precaution against carrying the contagion about with him, before again mixing in society.

The history of this remarkable disease is clothed in considerable obscurity. There is no evidence that it was known to the Greek or Arabian writers of the 6th c., and the first accurate description of it is that of Rhazes, an Arabian physician, who flourished early in the 10th century. It appears to have reached England toward the close of the 9th c. After the crusades it prevailed in most of the temperate countries of Europe, but did not reach the northern countries of Norway, Lapland, etc., for some time later. In 1517 it was carried from Europe to St. Domingo; and three years later, it reached Mexico, where it committed fearful devastations, and whence it spread with intense virulence throughout the new world. (According to Robertson, three millions and a half of people were destroyed in Mexico alone.) In 1707, it was introduced into Iceland, when more than a fourth part of the whole population fell victims to it; and it reached Greenland still la-

ter (in 1733), when it spread so fatally as almost to depopulate the country. These cases are striking illustrations of the law that seems universally true, that a contagious disease is always most virulent on its first introduction to a new scene of action.

SMALL-POX in SHEEP, *Variola ovina*, although resembling the small pox of men, is a distinct disease, not communicable either by contagion or inoculation to men or children, or even to dogs or goats. Although common on the continent of Europe, it was unknown in this country for at least a century, until in 1817 it appeared in Norfolk and the eastern counties, and in the summer of 1862 in Wiltshire near Devizes. Variolous sheep or infected skins appear in both cases to have imported the disease from abroad. About ten days after exposure to contagion, the infected sheep become feverish, have a muco-purulent nasal discharge, and a hot, tender skin. The red pimples which first appear, in about three days become white, and afterward leave scars or ulcers. The weakness is great, and the mortality varies from 25 to 90 per cent. Good food and nursing are the appropriate remedies. Promptly and carefully must the sick be separated from the sound; but if the spread of the disorder be not thus immediately checked, the whole of the sound flock should be inoculated. The disease thus artificially produced appears in ten days, runs a mild course, occasions a loss of from two to five per cent, and in three weeks the disorder is got rid of, and all risk of contagion over.—Further details will be found in prof. Simmonds's "Report on Small-pox," in vol. 25 of the *Journal of the Royal Agricultural Society of England*.

SMALLWOOD, WILLIAM, about 1730-92; b. Md.; in the revolution commanded a Maryland battalion; was present at White Plains, in Sullivan's Staten Island expedition, and at the battle of Germantown. He refused to serve under baron Steuben, and left the army with the rank of maj.gen. In 1785 he was elected to congress, and was governor of his native state, 1785-8.

SMALT, a name applied to the colored glass compositions used for making the tesserae employed in forming mosaics. See also COBALT.

SMART, BENJAMIN HUMPHREY, b. England 1785; a teacher of elocution in London. He was considered an authority upon English orthoepy, and was a voluminous writer on many topics. Among his works may be mentioned *Grammar of English Pronunciation* (1810), *Grammar of English Sounds* (1813), and a *Pronouncing Dictionary* (1836), founded upon Walker's.

SMART, CHRISTOPHER, 1722-70; b. Kent, England, educated at Cambridge, where he took the Scatman prize for poetry 5 years in succession. In 1753 he came to London and endeavored to make a living by his pen. He translated the Psalms, Horace, and Phædrus, into English verse, and made a prose translation of Horace. His original poems show considerable talent, and were published in collected form. He became insane through dissipation and deprivations, and died in a debtor's prison.

SMART-MONEY. See RECRUITING.

SMARTWEED. See POLYGOÑEÆ, *ante*.

SMEATON, JOHN, an eminent civil engineer, was b. at Austhorpe, near Leeds, in 1724, and early showed a bent toward mechanical pursuits. At the age of 15, he had constructed a machine for rose-engine turning. About 1750, he removed to London, to commence business as a mathematical instrument maker; but we find him in the following year resuming his desultory experiments in mechanical invention; an "odometer" for ships, a compass, and improvements in water and wind-mill machinery, being the chief products of his inventive genius. His improvements on mill-work were found on trial to be of great value, increasing the effective force by one-third, and gained Smeaton the Copley medal of the royal society in 1753. In 1753, he was chosen a member of the royal society; and in the following year, to extend his practical acquaintance with engineering, he visited the Netherlands, and inspected the embankments, canals, and other remarkable works of that country. In 1755, an event occurred which was to afford him the opportunity of attaining the very summit of his profession—the second wooden light-house on Eddystone rock was destroyed by fire in December. The speedy re-erection of another beacon was of the utmost importance, and the execution of the work was intrusted to Smeaton. The new light-house was built of stone; the cutting of the rock for the foundations commenced in Aug. 1756, the building was executed between June 1757, and Oct. 1759, and the lantern lighted on Oct. 16 of the latter year. This great work, the greatest of its kind hitherto undertaken, remained 120 years a stable monument of Smeaton's engineering skill. Yet he seems to have had little employment for some time subsequently, as he applied for and obtained in 1764 the post of "receiver of the Derwentwater estate," the funds of which were applied for the behoof of Greenwich hospital; and this situation he held till 1777, by which time he was in full professional employment. The chief of his other engineering works were the construction of the greater portion of Ramsgate harbor (1744); the laying out of the line of the Forth and Clyde canal, and the superintendence of the excavation of most of it; the rendering of the Calder (Yorkshire) navigable; the erection of Spurn light-house, and of several important bridges in Scotland; together with an immense amount of mill-machinery. He also greatly improved Newcomen's steam engine, but the mighty achievements of Watt in the same field threw his labors completely into the shade. He is said to

have prevented the fall of the old London bridge for many years by sinking a great quantity of stones around one of the piers, which had become undermined by the strength of the Thames current. In 1783, his health began to decline, and he retired from active business, dying at Austhorpe of paralysis, Oct. 28, 1792. He was one of the chief promoters of the "Society of Civil Engineers," which was started in 1771, and after Smeaton's death published (1797), in three 4to volumes, his numerous professional reports, which were regarded by his successors "as a mine of wealth for the sound principles which they unfold, and the able practice they exemplify." For a large portion of his life Smeaton was in constant attendance on parliament, which, in difficult or important engineering schemes invariably demanded, and almost always followed his advice—a proof not only of his eminence in his profession, but of his caution, judgment and integrity. See the biography prefixed to his "Reports."

SMEE, ALFRED, b. England, 1818; member of the college of surgeons, 1840; fellow of the Royal society, 1841; lecturer to the Aldersgate street school of medicine, surgeon to the bank of England, senior surgeon to the royal general dispensatory; a thorough student of electricity. He invented the Smee *voltaic battery* and the method by which the bank of England notes are printed. He is a conservative politician, and author of numerous works on physiology, electricity, etc.

SMELL. See NOSE.

SMELLIE, WILLIAM, 1740-95; b. Edinburgh, Scotland; became a printer, educated himself, and in 1759 was editor of the *Scots Magazine*. In 1771, then being a publisher, he issued the first edition of the *Encyclopædia Britannica*, many of the articles being written by himself. From 1773 to 1776 he was joint editor with Gilbert Stuart of the *Edinburgh Magazine and Review*. He was the author also of *The Philosophy of Natural History* (1790-99), which was reprinted in this country.

SMELT, *Osmerus*, a genus of the salmon or trout family (*salmonide*), of which only a few species are known, differing from the salmon, trout, etc., in having long conical teeth on the jaws and tongue, and on the tip of the vomer, the rest of the vomer being destitute of teeth; two distinct rows of teeth on each palatine bone.—The COMMON SMELT (*O. eperlanus*), called *spirling* or *spurling* in Scotland, and *eperlan* in France, is a fish of 8 or 10 in. (rarely 12 in.) in length. The form is very trout-like—rather more slender—the tail larger in proportion and more forked. The lower jaw is much longer than the upper. The scales are small; the back is whitish, tinged with green; the upper part of the sides shows bluish tints, the lower part of the sides and the belly are of a bright silvery color. The smelt has a peculiar cucumber-like smell and a delicious flavor, on account of which it is highly esteemed for the table, where it often appears as an accompaniment of other fish. The smelt is partly an inhabitant of fresh water, and partly of the sea. It ascends rivers to no great distance from the sea in autumn, and descends in spring. Great numbers of smelts are taken in estuaries and near the mouths of rivers by small-meshed nets. They are also taken on the open sea-coast, chiefly on low sandy shores as that of Lincolnshire. The attempt has been successfully made to keep the smelt continually in fresh-water ponds, in which it not only thrives well without loss of flavor, but propagated abundantly. No effort has yet been made to turn this discovery—not a very recent one—to any economical account. Although found both on the eastern and western coasts of Britain, the smelt is unknown on the S. coast of England, where the name smelt or SAND SMELT is given to the atherine (q.v.).—Another British species, the Hebridean smelt (*O. Hebrideus*), was first discovered near Rothesay in 1837 and described by Yarrell. It is so rare as to be unimportant.—The AMERICAN SMELT (*O. viridescens*) is regarded as distinct from the common smelt. It has a longer body and a greener back. It is found on the north-eastern coasts of America as far S. as the Hudson.

SMELTING. See IRON.

SMERDIS, the younger son of Cyrus, put to death secretly by the order of his brother Cambyses, who was jealous of him. The governor of the palace having a brother strikingly resembling the murdered prince, set him up as the true Smerdis, and on the death of Cambyses had him proclaimed king. Some of the Persian nobles soon suspected the cheat, and were satisfied of it when they found that the false Smerdis had no ears. Seven nobles then entered the palace and killed the pretender after he had reigned seven months. After this Darius Hystaspes was chosen king B.C. 521.

SMET, PETER JOXN DE, 1801-72; b. Belgium; educated at Mechlin; came to the United States in 1821; entered the Jesuits' novitiate at Whitmarsh, Md.; was one of the founders of the university of St. Louis; superintended missions among the Pottawattamie and Flathead Indians in 1840, and had great influence over the tribes. He published *Oregon Missions; Western Missions and Missionaries; Letters, Sketches, and Residence in the Rocky Mountains*.

SMEW, *Mergellus albellus*, a bird of the family *anatidæ*, very nearly allied to the goosander and mergansers, but having a shorter bill. The whole length of the male is not quite 18 in.; that of the female, not quite 15. The smew is only known in Britain as a winter visitant, appearing in greatest numbers in severe winters, and sometimes on

inland lakes and ponds, as well as on the sea-coast. It abounds on the northern coasts of Asia, and in some parts of continental Europe.

SMIBERT, or SMYBERT, JOHN, 1684-1751; b. Edinburgh; studied art in Italy, and became a portrait-painter in London. In 1728 he came to America with Dean Berkeley, and settled in Boston. Among his more noted works are the portrait of Jonathan Edwards and the group of Berkeley's family with the artist himself, now owned by Yale college.

SMILACEÆ, a natural order of exogenous plants, ranked by Lindley in his class dietyogens (q.v.), and consisting of herbaceous or half-shrubby plants, generally more or less climbing, with reticulated leaves, and bisexual or polygamous flowers, a 6-parted perianth, six stamens, a free 3-celled ovary, with cells one or many seeded, three stigmas, and a roundish berry. There are about 120 known species, mostly of the genus *Smilax*, scattered over the globe, but most numerous in the temperate and tropical parts of Asia and America. The root stocks (*rhizomes*) of many species yield sarsaparilla (q.v.). But some species have fleshy tubers, particularly *Smilax China*, a native of China and Japan, the tubers of which are very large and nutritious and used for food. *Smilax pseudo-China*, an American species, has similar tubers.—The roots of *Roxburghia viridiflora*, after being boiled and soaked in lime-water to remove their acidity, are preserved in syrup as an article of food in the Eastern peninsula and Malayan islands. The stems of this plant are sometimes 100 fathoms long.

SMILES, SAMUEL, b. Scotland, 1816; educated as a physician, but practiced a short time only. He was editor of the *Leeds Times*; in 1845 became connected with railway management, and continued in this until 1866. He has written many biographical and didactic books, such as the *Life of George Stephenson* (1858); *Self-Help* (1860), which attained a large circulation; and *Duty* (1880). His works are prized for practical moral and social lessons.

SMILLIE, GEORGE D., b. New York, 1840; son of James, the landscape engraver; studied painting with James M. Hart; opened a studio in 1862; exhibited for the first time, 1864. His "Sunny Brook Farm" brought him into notice, and soon after its appearance he became a member of the national academy of design. His favorite subjects are scenes from the Adirondacks and White Mountain views.

SMILLIE, JAMES D., b. New York, 1833; employed by the American bank-note company as engraver until he went to Europe in 1862 to study painting. He became a member of the national academy in 1865, having been associated with his brother George D. for the year previous. One of his most attractive pictures is "Ausable Lake," in the Adirondacks. He illustrated Bryant's poem, *Among the Trees*, with 22 plates.

SMIRKE, ROBERT, 1780-1867; b. England; began to practice his profession as an architect in London in 1805. Among his works in the classic style are the college of physicians, the post-office, the mint, and the British museum: in the Gothic style, the extension of the Inner temple, and the restoration of York minster. He published *Specimens of Continental Architecture* (1806).

SMIRKE, SYDNEY, b. England about 1800; brother of sir Robert, and himself an architect. His most important works are the Oxford and Cambridge university club, Pall Mall front, restorations in the Temple church, 1842, Peel's portrait gallery at Drayton Manor, the Carlton club, and (in connection with Mr. Panizzi, the librarian) the great British museum reading-room, of which the dome has a diameter but 2 ft. less than that of the Pantheon.

SMITH, a co. in n. Kansas, adjoining Nebraska; drained by Solomon river and several creeks; pop. '80, 13,885-13,006 of American birth. The surface, a rolling prairie, affords excellent pasture land; wheat, corn, and oats are staples. Co. seat, Smith Center.

SMITH, a co. in central Mississippi, drained by Strong and Leaf rivers; 620 sq.m.; pop. '80, 8,084. The surface is nearly level, with large forests of oak, pine, magnolia, and other trees; the soil is poor and sandy. The main productions are cotton, rice, Indian corn, sweet potatoes, and wool. Sheep and swine are raised in large numbers. Co. seat Raleigh.

SMITH, a co. in n. Tennessee, intersected by Cumberland river and Caney Fork; 300 sq.m.; pop. '80, 17,799. The surface is hilly, with large forests of black walnut, oak, poplar, and tulip trees; the soil is fertile. The main productions are wheat, corn, oats, sweet potatoes, tobacco, wool, honey, butter, and sorghum molasses. Sheep and swine are raised in great numbers. Limestone is found in some parts. Co. seat, Carthage.

SMITH, a co. in n.e. Texas; drained by the Sabine river, its n. boundary, and by the Neches and Angelina; traversed by the International and Great Northern railroad; about 1000 sq.m.; pop. '80, 21,850-21,715 of American birth, 10,357 colored. The surface is rolling and heavily wooded; cotton, corn, wheat, pork, and cattle are the staples. Co. seat, Tyler.

SMITH, ADAM, the founder of political economy as a separate branch of human knowledge, was b. in the town of Kirkcaldy, in Fifeshire, on June 5, 1723. His family belonged to the respectable middle class of Scotch life; his father was comp-

troller of the customs of the port of Kirkcaldy, and his mother, Margaret Douglas, was the daughter of a small Fifeshire laird. His father died a short time before his birth, and he was the object of the care and solicitude of a widowed mother, to whom he was closely attached, and who long lived to be proud of his attainments. When he was no more than three years old, the poor woman got a sad fright, from a calamity hardly known at the present day—the child was stolen by gypsies; but he was tracked and recovered by his uncle as they were seeking a hiding-place in the neighboring wood of Leslie. This was the only adventure in his quiet life. After getting the usual burgh-school education in Kirkcaldy, he was sent, in 1737, to the university of Glasgow. He there secured an exhibition on the Snell foundation, which took him to Balliol college, Oxford. He studied there for seven years, and left traditions as of a man of large acquirements and peculiar independence of thought. It is said that he was intended for the English church, but if so, his own convictions crossed the designs of his friends. He returned to Kirkcaldy, and lived for a while with his mother there in undisturbed seclusion and study. It was said to be his practice to stand ruminating, with his back to the fire, and his head leaning against the chimney-piece—and over an old fireplace in Kirkcaldy it used to be shown how he had thus worn a piece off the paint. In 1748 he came to Edinburgh, where silently and unostentatiously he became one of the brilliant little circle of men of letters who were then rising to importance. In 1751 he got the chair of logic in the university of Glasgow, and this was changed a year afterward for that of moral philosophy. In 1759 appeared his *Theory of Moral Sentiments*; celebrated for its reference of the mental emotions to the one source of sympathy. The *Dissertation on the Origin of Languages* was published along with the later editions of this book. Both had a great reputation in their day, and although they are now among obscure books in comparison with that other by which the author's name is remembered, the position they held with respectable thinkers gave a hearing to his doctrines on political economy which they would hardly have otherwise obtained. In 1762 the university of Glasgow gave him the degree of doctor of laws. In the following year he undertook a task, which might at first seem very uncongenial to a mind like his, given to retired study and independent thought and action. He became "governor" or traveling tutor to the young duke of Buccleuch. He was then sedulously collecting materials for his great work, and no doubt the inducement to accept of the office was the opportunity it gave him for traveling and seeing for himself. He had the opportunity of being nearly a year in Paris, and of mixing in the circle of renowned wits and philosophers of the reign of Louis XV. In 1766 his function came to an end, and he returned to Kirkcaldy to live in the old house with his mother. The year 1776 was an era in the history of the world as well as that of the Kirkcaldy recluse, in the appearance of the *Inquiry into the Nature and Causes of the Wealth of Nations*. If there was any living man to whose works he was indebted for the leading principles of this book, it was David Hume, and it was from him, as best understanding the fullness and completeness of the exposition, that it had its first emphatic welcome. He wrote immediately on receiving it: "EDGE BELLE.—DEAR MR. SMITH—I am much pleased with your performance; and the perusal of it has taken me from a state of great anxiety. It was a work of so much expectation by yourself, by your friends, and by the public, that I trembled for its appearance, but am now much relieved. Not but that the reading of it necessarily requires so much attention, and the public is disposed to give so little, that I shall still doubt, for some time, of its being at first very popular. But it has depth, and solidity, and acuteness, and is so much illustrated by curious facts, that it must at last take the public attention." This was not destined to be exactly the literary history of this great work. Its startling doctrines, fine clear style, and abundant illustration from curious facts took at first; but counteracting influences arose when people saw how far the new doctrines went in playing havoc with old prejudices. The French revolution set the mind of this country bigoted against everything that breathed of innovation. It was known that the younger Pitt participated at first in Smith's free-trade notions, but he had afterward, whether from permanent connection or temporary policy, to put himself in the foremost ranks of the enemies of innovation. It was not until long after the terrors of that epoch and the nervous vicissitudes of the war had passed over, that Smith's work had an opportunity to revolutionize the public mind on matters of trade and finance. It came up, as it were, the leader of a great literary host, for expounders had crowded in numbers round *The Wealth of Nations* as the text-book of sound economy. Of a book so well known and so much read it is needless to speak. The only reproach brought against it is that it is not systematic in its form, and that its nomenclature is not exact. But its author was not arranging the results of established knowledge—he was rather pulling down existing structures, compounded of ignorance and prejudice. Nor, indeed, have those who have attempted to make an exact science out of political economy practically vindicated the reproach they have cast on him of being unmethodical. Whatever we may yet come to, very few portions indeed of political economy admit of being treated as exact science. It is too closely connected with human passions and energies, and consequently with special results and changes, to be so treated; and the best books on the subject are still characterized by the discursiveness and mixed philosophy and fact of the *Wealth of Nations*. In 1778, Smith was made a commissioner of customs. The only effect of this was to bring him to Edinburgh, and increase his means for indulging in his favorite weakness, the collection of a

fine library; for he was, as he called himself, a "beau in his books." In 1784 he suffered that affliction which was sure to come if he lived long enough for it—the loss of his worthy mother. He followed her six years afterward, dying in July, 1790.

SMITH, ALBERT, 1816-60; b. England; a surgeon, who settled in London in 1841, and became a regular writer for the press, including *Bentley's Miscellany* and *Punch*. He ascended Mont Blanc in 1851, and his "entertainments" on that subject were successful for some years. He also went to China, and on his return gave a Chinese "entertainment." His *Story of Mont Blanc* appeared in 1853; *To China and Back*, in 1859.

SMITH, ALEXANDER, poet, was b. at Kilmarnock, in Ayrshire, Dec. 31, 1830; received, as a boy, a fair English education, and passed from school into a Glasgow warehouse as a pattern designer. While following this occupation, he began to write poetry. His first volume entitled the *Life Dramat*, was published in 1853, and created something like a furore in literary circles. A reaction, however, followed, and the author had scarcely found himself famous when he began to be abused. The faults of his book were obvious enough; every page contained evidence of immaturity, and its natural result, extravagance; while a rather narrow reading having made him passionately attached to a few modern poets, as Keats and Tennyson, their peculiar turns of expression reappeared in his verse, and gave color to the charge of plagiarism, which was pushed to an absurd length. But impartial critics were not slow to perceive a richness and originality of imagery that more than atoned for all defects of taste and knowledge. In 1854, Smith was appointed secretary to the university of Edinburgh; and in the following year, along with Sydney Dobell (q.v.), produced a volume of *Sonnets on the War*. He afterward wrote *City Poems* (1857), *Edwin of Deira* (1861), and several prose works, as *Dreamthorp* (1863), *A Summer in Skye* (1865), and *Alfred Hugart's Household* (1865). Smith was perhaps not less distinguished as a writer in prose than in verse, his prose style being marked by picturesqueness, polish, and originality. He died in 1867.

SMITH, ANDREW JACKSON, b. Penn., 1814; graduated at West Point. Before the war of the rebellion he served on the frontier against hostile Indians; col. 2d California cavalry, 1861; brig.gen. vols., 1862. He was chief of cavalry in Missouri and Mississippi, in the army of the Tennessee, and in the Yazoo expedition; and was at Chickasaw Bluffs, the capture of Jackson, and the capture of Mobile. He was mustered out of the vol. service in 1863, and retired from the regular army, 1869. For gallantry in Mississippi and Tennessee, brevetted col., brig.gen., and maj.gen.

SMITH, ASA DODGE, D.D., LL.D., 1804-77; b. Mass.; graduated at Dartmouth college in 1830, and at Andover theol. seminary in 1834; pastor of Fourteenth street Pres. church, New York, 1834-63; became president of Dartmouth college in 1863; resigned in 1877, and died in Hanover the same year. He published *Letters to a Young Student*; *Importance of a Christian Ministry*; *The Puritan Church's Stewardship*, and other sermons. During his pastorate in New York he was one of the most prominent and successful ministers of his denomination in that city; and his presidency of Dartmouth was notable for the good work done in the college and its associated schools, and for the large amounts of money secured for it through pres. Smith's influence.

SMITH, AZARIAH, 1817-51; b. N. Y.; graduated at Yale college in 1837; studied medicine; studied theology at New Haven in 1839, and took medical degree; sailed 1842 as a missionary of the American board for the Levant; traveled extensively in Asia Minor; settled in Aintab in 1848. He contributed papers on meteorology and Syrian antiquities for Silliman's *Journal of Science*.

SMITH, BENJAMIN BOSWORTH, b. R. I., 1794; studied at Brown university; ordained, 1818; consecrated bishop of the Protestant Episcopal diocese of Kentucky, 1833. He was the editor of the *Episcopal Register*, of Vermont, 1827, of the *Episcopal Recorder*, Philadelphia, 1829. He is now residing in New York, and is the senior bishop of his church.

SMITH, BUCKINGHAM, 1810-71; b. Ga.; graduated at Harvard law school 1836; practiced for a time in Maine, but in 1850 was made *chargé d'affaires* in Mexico. From 1853 to 1859 he was secretary of the Madrid legation. He published several books and papers on the conquest of Florida, De Soto's discoveries, and kindred topics.

SMITH, CHARLES FERGUSON, 1805-62; b. Penn.; graduated at West Point and served with distinction through the Mexican war. During the war of the rebellion he was in the federal army, in which he rose to be maj.gen. He was for some time commander of the federal forces in Kentucky, and led the decisive charge at fort Donelson.

SMITH, CHARLES HENRY, b. Maine, 1827; served in the federal army through the war of the rebellion and was brevetted maj.gen. He distinguished himself in Sheridan's cavalry campaign of 1864, and in the operations which resulted in the surrender of Lee.

SMITH, DANIEL, about 1755-1818; b. Va.; one of the first settlers of Tennessee, and a revolutionary patriot. After the war he held several local offices, was member of the Tennessee constitutional convention, and U. S. senator, 1793-99 and 1806-09. In 1799 he published the first map of the state.

SMITH, EDMUND KIRBY, b. Fla., 1825; graduated at West Point, 1845; served with distinction in the Mexican war and afterward taught at the academy. He resigned in 1861 with rank of major, and entered the confederate army, serving as brig.gen. under Johnston, and heading the fresh troops which decided the battle of Bull Run. In 1862 he was made lieut.gen. and commanded at Murfreesborough. In 1863 he was with the Mississippi army, and surrendered to gen. Canby in 1865.

SMITH, EDWARD P., 1827-76; b. Conn.; educated at Dartmouth and Yale colleges, and the theological seminary of New Haven; pastor for several years of the Congregational church at Pepperell, Mass.; was field-secretary of the U. S. Christian commission during the rebellion; after the war general agent for the American missionary association in the southern states; appointed U. S. commissioner of Indian affairs, 1873; went to Africa 1875, to visit the missions of the American missionary association; reached the river Gambia, where he died. He published *Incidents of the United States Christian Commission*. He had excellent administrative ability, and earnest Christian philanthropy.

SMITH, ELI, D.D., 1801-57; b. Conn.; graduated Yale college 1821; left Andover theol. seminary 1826, and went as a missionary of the American board to Turkey; made a missionary tour, 1829, through Greece; again through Armenia and Georgia to Persia, which opened the way for a mission to the Nestorians; made with Dr. Robinson, 1837, a tour in Egypt and Palestine, ably aiding his researches in Biblical geography. A good classical and Hebrew scholar, he acquired also French, Italian, German, and Turkish; and Arabic was to him a second vernacular. He prosecuted with zeal every collateral study in order to qualify himself for what he considered his great work, a faithful translation into Arabic of the word of God. He drew for himself after careful study of the art, with utmost accuracy, models of type, and superintended the cutting, casting, and perfecting of the fonts. An account of his tours was published in two vols.

SMITH, ELIZABETH OAKES (PRINCE), b. Cumberland, Me.; descendant of gov. Prince of the Plymouth colony and pres. Urian Oakes of Harvard university; removed in infancy to Portland, Me.; married Seba Smith, an editor, while quite young, and wrote prose and verse and assisted her husband in his profession. In 1839, meeting with financial reverses, she adopted literature as a means of subsistence, and settled in New York in 1842, contributing to the magazines and reviews, corresponding for papers, writing stories, plays, and lectures. She removed to North Carolina, 1876. She published *Woman and her Needs*, 1851.

SMITH, GEORGE, 1825-76; b. England; in 1866, while examining the Assyrian paper casts in the British museum, discovered an inscription of Shalmaneser II. concerning the war against Hazael; in 1867 aided in preparing a volume of cuneiform inscriptions, and from that time devoted himself to the study of them. Among his earlier discoveries are: a notice of an eclipse, 763 B.C.; of several kings of Israel: of conquest of Babylonia, 2280 B.C.; of Chaldean account of the deluge; in 1871 published a work giving the texts, transcriptions, and translations of documents pertaining to Asshur-bani-pal (Sardanapalus). In 1873-74 he went twice to Nineveh, obtaining 3,000 inscriptions and many other important acquisitions; in 1876 went again to the east and died while exploring the Euphrates valley.

SMITH, GERRIT, 1797-1874; b. N. Y.; graduated at Hamilton college in 1818. Being heir to one of the largest properties in the country, his time was occupied chiefly in its care; but he was admitted to the bar in 1853, and practiced to some extent. He was prominent in benevolent undertakings, and associated himself with organizations such as the American colonization society and the American anti-slavery society from an early period. His personal liberality was great, and he divided more than 200,000 acres of land in free gifts, partly among public institutions, but also largely in small parcels of about 50 acres among poor persons, black and white. He also gave large sums in aid of emancipation. He was a member of congress in 1852, and there and everywhere gave the freest vent to his pronounced opinions in favor of liberty of speech, conscience, and the person.

SMITH, GOLDWIN, LL.D., son of a Berkshire physician, was b. at Reading in 1823. He received his education at Eton, from whence he proceeded to Oxford, and matriculated at Christ's church, but was soon afterward elected to a Demyship at Magdalen. His undergraduate career was one of unusual brilliancy, only equaled, indeed, by sir Roundell Palmer and prof. Conington. He gained both university scholarships, the Latin verse, and the two prize essays, and was placed in the first class in 1845. In 1847 he was elected fellow of University college, where he officiated for a time as tutor. In the same year he was called to the bar at Lincoln's inn. The ministry of the day availed themselves of Mr. Smith's services in carrying out their plans of university reform. He was nominated assistant-secretary to the first, and secretary to the second Oxford commission, by which the somewhat antiquated statutes of the university were reconstructed, and the rich endowments of the colleges opened to public competition. Mr. Smith was also a member of the popular education commission appointed in June, 1858. The chair of modern history having been vacated about this time by the resignation of prof. Vaughan, was offered by lord Derby to Mr. Smith. He accepted the offer, and discharged his professional duties with zeal and efficiency until his resignation in

1866. In 1868 he was elected to the chair of English and constitutional history in the university at Ithaca, N. Y. He has lately resided in Canada. Goldwin Smith has long been known as a publicist of the highest class, and has completely identified himself with the more advanced school of reformers. During the American war he was an earnest defender of federal interests, and combated with success in the *Daily News* and elsewhere, the singular theories of the rights of slavery and the duties of neutrals, which were then somewhat fashionable. He was also active in denouncing the Jamaica massacres, and in advocating an extended measure of reform. His lectures on "Three English Statesmen," delivered at some of the chief towns in the north, called forth the remark from Mr. Disraeli, that he was a "wild man of the cloister, going about the country maligning men and things." Mr. Smith's writings are characterized by great extent and accuracy of information, by a style singularly vigorous and condensed, and by great powers of sarcasm. Among his principal publications may be enumerated: *Irish History and Character*; *Two Lectures on the Study of History, with a Supplementary Lecture on the Doctrine of Historical Progress*; *The Empire*, a reprint from the *Daily News* of 1862-63; *England and America*, a lecture delivered before the Boston fraternity, and reprinted from the *Atlantic Monthly*; *A Plea for the Abolition of Tests at Oxford*; *Rational Religion and the Objections of the Bampton Lecture in 1858*; several pamphlets on the American question; contributions to Oxford essays; *A Short History of England*; etc. He is also the author of some of the most admired compositions in the *Anthologia Oroniënsis*.

SMITH, GREEN CLAY, b. Ky., 1820; educated at Transylvania university. He was a volunteer in the Mexican war, practiced law in Kentucky, of whose legislature he was a member, served in the federal army, 1861-63, and rose to be brig. gen. He was afterward member of congress and governor of Montana.

SMITH, HENRY BOYNTON, D.D., LL.D., 1815-77; b. Me.; graduated at Bowdoin college in 1834; was tutor in Greek and librarian, 1836-37 and 1840-41; studied theology at Bangor and Andover, Halle, and Berlin. In Germany he was honored by theologians for his learning. In 1842 he became pastor of the Congregational church, West Amesbury, Mass., filling also for two years in connection with his pastoral duties the chair of Hebrew in Andover seminary; was professor of mental and moral philosophy at Amherst college, 1847-50; of church history in Union seminary, 1850-55; and of systematic theology, 1855-73, when enfeebled by unremitting toil he retired from the chair though retained as emeritus professor of apologetics until his death. His publications are: *The Relations of Faith and Philosophy*; *Nature and Worth of the Science of Church History*; *Problem of the Philosophy of History*; *The Reformed Churches of Europe and America in Relation to General Church History*; *The Idea of Christian Theology as a System*; *History of the Church of Christ*; *Chronological Tables*. He edited for many years *The American Theological Review*, and contributed largely to the *Bibliotheca Sacra* and other reviews. He had brilliant scholarship, a fervid and deeply spiritual nature, a gentle and winning disposition; and especially in church history his work has enduring value.

SMITH, ISAAC, 1736-1807; b. N. J.; graduated at Princeton, 1755; was tutor there; studied medicine; col. of a regiment, 1776, in the patriot army, and was distinguished for his patriotism throughout the war. At its close he was appointed judge of the supreme court of New Jersey, holding the office 18 years. He was a member of congress, 1795-97; treated with the Seneca Indians as U.S. commissioner under pres. Washington, 1797; president of the bank of Trenton, 1807.

SMITH, ISRAEL, 1759-1810; b. Conn.; educated at Yale college, and settled in Vermont, where he was elected to the legislature. He was a member of congress, 1791-97 and 1801-3; chief-justice of the state supreme court in 1797, and U. S. senator, 1803-7. He was a member of the convention that adopted the federal constitution, and was active in securing the admission of Vermont as a state.

SMITH, JAMES, 1720-1806; b. Ireland; was brought to America when a child; engaged in surveying and legal study, and began practice in York, Penn. He was a member of the provincial meeting in Philadelphia, 1774, and was elected a member of the continental congress in 1776.

SMITH, JAMES, 1737-1812; b. Penn.; captured and adopted by the Indians in 1759, but afterward escaped. He was a lieutenant in Bouquet's expedition in 1764; a col. in the revolutionary war, and afterward a member of the Kentucky legislature. He wrote *Remarkable Occurrences in the Life and Travels of Col. James Smith (1799)*.

SMITH, JAMES and HORACE, authors of *The Rejected Addresses*, were sons of an eminent London solicitor. James was b. Feb. 10, 1775, d. Dec. 24, 1839; Horace was b. Dec. 31, 1779, d. July 12, 1849. James followed his father's profession, and succeeded him as solicitor to the board of ordnance; Horace adopted the profession of a stock-broker, and realized a handsome fortune, on which he retired with his family to Brighton. Both were popular and accomplished men—James remarkable for his conversational powers and gaiety, and Horace (the wealthier of the two) distinguished for true liberality and benevolence. The work by which they are best known is a small volume of poetical parodies or imitations, perhaps the best in the language. On the

opening of the new Drury Lane theater in Oct. 1812, the committee of management advertised for an address to be spoken on the occasion, and the brothers Smith adopted a suggestion made to them, that they should write a series of supposed "Rejected Addresses." They accomplished their task in the course of a few weeks—James furnishing imitations of Wordsworth, Southey, Coleridge, Crabbe, Cobbett, etc.; while Horace contributed imitations of Scott, Byron (all but the first stanza), Monk, Lewis, Moore, and others. In point of talent, the authors were about equally matched; for though James had the greater number of successful imitations, the one by Horace of Scott, is the most felicitous of the whole. It is a curious fact in literary history that a work so exceedingly popular should have had great difficulty in finding a publisher; and that the copyright, which had been originally offered to Murray for £20, and refused, was purchased by him in 1819, after the book had run through 16 editions, for £131. The authors received above £1000 from the sale of the work. James was afterward an occasional contributor to the periodical literature of the day, and author of the humorous theatrical entertainments of Charles Mathews (for which he received £1000). Horace Smith wrote several novels—*Bramblyte House*, *Tor Hill*, etc.

SMITH, JEREMIAH, LL.D., 1759–1842; b. Peterborough, N. H.; graduate of Rutgers college, 1780; distinguished as a lawyer and a scholar; member of congress, 1791–97. He was governor of New Hampshire, 1809–10, chief-justice of the superior court for several years, and intimate friend of Daniel Webster. He published *Sketch of the character of Judge Caleb Ellis*.

SMITH, JOHN, 1579–1631, b. at Willoughby, Lincolnshire, England. He was left an orphan at an early age, and his guardians permitted him to indulge the roving spirit which distinguished him. At the age of fifteen he accompanied the sons of an English nobleman on a tour of the continent as a page. But he soon left them and enlisted under the Protestant banner in France. He served as a soldier of fortune in different lands, and, according to the memoirs which he published of his life, met with a series of wonderful and romantic adventures. The coloring of romance, however, with which the narrative is imbued is too vivid to appear entirely trustworthy, and contradictions have been discovered in some of his statements. The most remarkable of these records is the account of his victory over three Turks, whom he asserts he slew in single combat under the walls of Regall, in Transylvania. For this achievement he claims to have been ennobled by the ruler of that realm, receiving a patent of nobility (which he publishes in the original Latin) empowering him to emblazon upon his shield the bleeding heads of three Turks—a privilege of which he does not appear to have availed himself. Having returned to England he was induced to take part in the colonization of Virginia, and sailed with the vessels fitted out for this purpose in 1607. He was named a member of the council to direct the affairs of the infant community in the secret list prepared before the departure of the fleet, but during the voyage he was imprisoned on a charge of sedition. On the arrival of the vessels, when the list was examined, he was not allowed to take his seat; he indignantly demanded an immediate trial, which was finally accorded. He established his innocence, but the jealousy of his comrades still excluded him from his seat. But his military reputation, his fiery spirit, tempered by prudence and sagacity, soon made his influence felt, and his advice was often sought by the authorities. With rare magnanimity, considering the injustice with which he had been treated, he did not refuse his assistance. He was sent on several expeditions for forage and discovery among the Indians, and distinguished himself by the ability with which he conducted them. It was on one of these occasions, in Dec., 1607, that Smith was captured by the Indian chief whom in his narrative he calls Powhatan. The story which he relates of the young Indian maiden, Pocahontas, who, when he was condemned to death by the savage chieftan, saved his life by her interposition, has been discredited in many of its details, though there can be no doubt that such a woman lived and was married to an Englishman of the name of Rolfe. Her blood flows in the veins of some distinguished Virginian families. Mr. Charles Deane, in his notes to Wingfield's *Discourse of Virginia* (Boston, 1859) was the first to throw doubts on the truth of this celebrated romance. Smith's influence became paramount in the little settlement, which was called Jamestown, after the reigning monarch. He was elected president of the council, Sept. 1608, and several times saved the colony from ruin by his decision, sagacity, and force of character. In his dealings with the Indians he showed himself an astute and unscrupulous politician, and a valiant soldier, who, by a species of military intuition became at once an ad-apt in all the peculiarities of Indian warfare. His services were not sufficiently appreciated, and he returned to England broken in health and poor in purse. He was sent out on various voyages of discovery, and gave to New England the name she now bears. He died in London, and was buried in the choir of St. Sepulchre's church.

SMITH JOHN, "of Cambridge," 1618–52; graduated at Cambridge, 1640; fellow of Queen's college, 1644, and for several years tutor and mathematical lecturer there; became a clergyman and was accounted "a man of great abilities, vast learning, possessing almost every grace and virtue which can adorn human nature." His *Select Discourses* were often reprinted and highly esteemed. Several biographies of him have been written by distinguished men.

SMITH, JOHN BLAIR, D.D., 1756-99, b. Penn.; graduated at Princeton, 1773; studied theology with his brother, and succeeded him as president of Hampden Sidney college, 1799; was an effective preacher in Virginia; pastor of the Third Presbyterian church, Philadelphia, 1791-95; president of Union college 1795-99; returned to his pastoral charge at Philadelphia, 1799, and died there of an epidemic disease.

SMITH, JOHN COTTON, LL.D., 1765-1845; b. Sharon, Conn., son of Cotton Mather Smith, descended from John Cotton and Richard Mather; graduated at Yale college, 1783. He practiced law in Litchfield co., 1786; member of the lower house, 1793 and 1796-1800; clerk of the house, 1799; speaker, 1800; member of congress, 1800-6. He was representative from Sharon in the state legislature, 1806-9, and member of the council. He was appointed judge of the supreme court, 1809; lieutenant governor in the same year, and governor, 1813-18. He was a contributor to the periodicals, and a member of several historical and antiquarian societies, the American board for foreign missions, and the American Bible society.

SMITH, JOHN COTTON, D.D., b. Mass., 1826; graduated at Bowdoin college in 1847; studied theology at Gambier, Ohio; ordained to the Protestant Episcopal ministry in 1849; rector of St. John's church, Bangor, Maine.; assistant minister of Trinity church, Boston in 1852; rector of Ascension church, New York, in 1860. He published essays, afterward collected in a volume entitled *Miscellanies, Old and New*. He has published several sermons and lectures. His writings show breadth of Christian spirit, and such certainty of faith as to preclude fear of new phases of truth.

SMITH, JOHN E., b. Penn.; at the beginning of the war of the rebellion, aid-de-camp to governor Yates of Illinois; in active duty at fort Henry, fort Donelson, Shiloh, and Corinth; made brig.gen., 1862; engaged in all the important battles of the Louisiana campaign. He was in the Mississippi and Atlanta campaigns in 1864, and marched with Sherman to the sea; col. 14th U. S. infantry, 1870; brevetted maj.gen. regular army.

SMITH, JOHN HYATT, D.D., b. N. Y., 1823; licensed as a Baptist preacher in 1848; pastor of the Eleventh Baptist church, Philadelphia, and of the Lee avenue church, Brooklyn, N. Y. He is a popular preacher, a favorite with the working classes, and a zealous advocate of open communion. He is now a member of congress, but retains his pastorate.

SMITH, JOHN LAWRENCE, b. S. C., 1818; graduated at the university of Virginia, and the medical school of the university of South Carolina; civil engineer on the Charleston and Cincinnati railroad. He studied 3 years in France and Germany, practiced medicine in Charleston, S. C., 1844, and gave lectures on toxicology and agricultural chemistry. In 1846-51 he was mining engineer to the Turkish government, explored Asia Minor, discovered deposits of emery and corundum in the United States; invented the inverted microscope, 1851. He was professor of chemistry in the university of Virginia, and in the university at Louisville, Ky.; U. S. commissioner to the Paris exposition, 1867, and Vienna, 1872. He received the cross of the legion of honor from Napoleon III. He is a member of many scientific societies, president of the American association for the advancement of science, 1872; author of *The Progress and Condition of Several Departments of Industrial Chemistry*, 1867.

SMITH, JOHN PYE, D.D., LL.D., 1774-1851, b. England; entered an Independent academy at Rotherham, in his 22d year; became classical tutor in the Homerton theological school (Congregational) 1800, divinity tutor 1813-43; and again classical tutor, 1843-50. He was a fellow of the Royal and geological societies. His principal works are: *Scripture Testimony to the Messiah*; *The Sacrifice and Priesthood of Christ*; *The Personality and Divinity of the Holy Spirit*; *Mosaic Account of the Creation and Deluge Illustrated by the Discoveries of Modern Science, and Scripture and Geology*.

SMITH, JONATHAN BAYARD, 1741-1812, b. Philadelphia; graduated at the college of New Jersey. He was a merchant in Philadelphia, a member of the continental congress, 1777-78, and for many years a judge of the court of common pleas.

SMITH, JOSEPH. See MORMONS.

SMITH, JUNIUS, LL.D., 1780-1853, b. Conn.; graduated at Yale, and at the Litchfield law school. In 1832 he began to urge a scheme for the navigation of the Atlantic with steamships. He organized the British and American steam navigation company in 1836, under whose direction, two years latter the little steamer *Sirius* crossed the Atlantic.

SMITH, MATTHEW HALE, 1810-79, b. Conn.; was a Universalist preacher and afterward joined successively the Presbyterians, Episcopalians, and Baptists; published reasons for some of these changes; became a lawyer, editor, politician, and business man; returned to theology; also was New York correspondent (Burleigh) of the *Boston Journal*. The latter part of his life was spent in New York and Brooklyn.

SMITH, MELANCTHON, b. N. Y., 1869; entered the navy in 1826, and through successive grades became rear-admiral (retired) in 1870. He served through the Seminole war, fought the confederate steamer *Florida* in 1861, ran the confederate ram *Manassas* ashore at the capture of New Orleans, took part in the attacks on port Hudson,

fought the ram *Albemarle* in 1864, and commanded the frigate *Wabash* in the attacks on fort Fisher.

SMITH, MILES, D.D., 1550-1624, b. England; graduated at Oxford; studied deeply patristic literature and the oriental languages; became bishop of Gloucester, 1612; was a principal translator of king James's version of the Bible, for which he wrote the preface. A volume of his sermons was printed after his death.

SMITH, MORGAN L., 1818-74, b. N. Y.; enlisted in the regular U. S. army when young, and for gallantry in the Mexican war was made sergeant. He then engaged in business and in 1861 raised and commanded a regiment from Illinois and Missouri. He was at fort Donelson and in the Shiloh, Vicksburg, and Chattanooga campaigns. He was promoted to the rank of maj. gen. and commanded a division in Sherman's march to the sea. After the war he was consul at Honolulu.

SMITH, NATHAN, 1762-1829, b. Mass.; studied medicine, and in 1798 became professor in the medical school just established at Dartmouth college. He also delivered lectures at Bowdoin college, and at the university of Vermont. He wrote *Essay on Typhus Fever* (1824); and *Medical and Surgical Memoirs* (1831).

SMITH, PERSIFER FRAZER, 1798-1858; b. Philadelphia; graduated at Princeton college 1815; studied law and practiced at New Orleans. He served in the Florida war, commanded the Louisiana brigade in the Mexican war under Taylor, and was brevetted brig. gen. and maj. gen. for gallantry at Monterey, Contreras, and Churubusco. He was a commissioner to conclude peace with Mexico, governor of Mexico, 1847, of Vera Cruz, 1848, also military commander of California and Texas.

SMITH, RICHARD, b. Ireland, 1823; when eighteen years of age came to the United States and settled in Cincinnati, where he worked in a carpenter shop for three years, when he became a reporter. In 1849 he received the appointment of superintendent of the Cincinnati chamber of commerce, and bought the *Price Current*, which he edited. In 1854 he bought into the *Gazette*, and after a few years became its managing editor, and still occupies the position.

SMITH, RICHARD SOMERS, b. Philadelphia, 1813; graduated at West Point, where he was assistant professor of drawing, 1840-56, when he resigned from the army and became professor of mathematics and drawing in the Brooklyn polytechnic institute, where he remained till 1859. He served in the war against the rebellion till 1863, when he resigned to become president of Girard college, where he remained till 1868. He has since been professor of engineering at the Pennsylvania state polytechnic college, and of drawing at the U. S. naval academy.

SMITH, ROBERT, D.D., 1732-1801; b. England; graduated at Cambridge, and obtained a fellowship there; became rector of St. Philip's church, Charleston, S. C., 1759; was a volunteer soldier during the revolution; preached in Queen Anne co., Md.; president of Charleston college, 1786-98; first bishop of the diocese of South Carolina, 1795.

SMITH, ROBERT ANGUS, PH.D., b. Glasgow, Scotland, 1817; studied at the university of Glasgow and with Liebig at Giessen. He became a professional chemist; has given much study to disinfectants, ventilation, and climatology, and has published many papers on these and kindred subjects. In 1857 he was made a fellow of the Royal society, has been president of the Manchester literary and scientific society, and is a member of other scientific associations.

SMITH, ROBERT PAYNE, D.D., b. England, 1818; graduated at Pembroke college, Oxford, 1841, obtaining there three oriental scholarships; curate of Trinity, master of the Edinburgh academy, and afterward head-master of Kensington school; sub-librarian of the Bodleian library, having charge of oriental manuscripts, 1857-65; canon of Christ-Church, Oxford, and regius professor of divinity, 1865-71; and dean of Canterbury 1871 to the present time. He was a delegate to the evangelical alliance at New York, 1873, and was a member of the Old Testament revision committee. His published writings include several works of oriental scholarship; a defense of the authenticity and Messianic interpretation of Isaiah, Bampton lectures for 1865; and commentary on Jeremiah.

SMITH, SAMUEL, 1752-1839; b. Carlisle, Penn.; son of John Smith, a resident of Baltimore, 1760, who was member of the legislature and chairman of the committee of ways and means in the revolutionary war. Samuel was educated at Carlisle, Baltimore, and Elkton; entered his father's counting-room; and visited Europe, 1771; capt. in Smallwood's regiment, 1776; performed effective service on Long Island. He distinguished himself at Harlem and White Plains; lieut. col. of the 4th Md. regiment, 1777; defended fort Mifflin, and received a sword and the thanks of congress. He was at Valley Forge and at Monmouth. He was a member of the state legislature, and member of congress, 1793-1833; for a short time secretary of the navy under president Jefferson. In the war of 1812 he was maj. gen. of the state militia, and active in the defense of Baltimore; mayor of Baltimore, 1835.

SMITH, SAMUEL FRANCIS, D.D., b. Boston 1808, graduated at Harvard college in 1829; studied theology at Andover, pastor of a Baptist church at Waterville, Me., and professor of modern languages in Waterville college, 1834-42; pastor at Newton, Mass.,

1842-54. He has published *Life of Rev. Joseph Grafton*. He edited the *Baptist Missionary Magazine* and *Christian Review*. He is the author of several favorite hymns.

SMITH, SAMUEL STANHOPE, D.D., LL.D., 1750-1819; b. Penn.; was a pupil and teacher in his father's classical academy, where he also studied theology; tutor in the college of New Jersey, 1770-73; ordained and preached in Virginia, 1774; was the first president of Hampden-Sidney college, 1775-79; appointed professor of moral philosophy in the college of New Jersey, 1779, and of theology, 1783; vice-president, 1786, and president, 1795-1812. He was an eloquent preacher and of distinguished personal appearance and manners. Among his published writings are, *Lectures on the Evidences of Christianity* and on *Moral Philosophy*; *System of Natural and Revealed Religion*, and many separate sermons and lectures.

SMITH, SEBA, 1792-1868; b. Me.; educated at Bowdoin college. After editing at Portland the *Eastern Argus*, and the *Courier*, he removed to New York in 1842. His *Life and Letters of Major Jack Downing* (1833), a series of humorous letters on political subjects, was exceedingly popular. Among his works may be mentioned *Way Down East* (1854).

SMITH, Rev. SYDNEY, a celebrated wit and humorist, and the original projector of the *Edinburgh Review*, was born at Woodford, in Essex, in 1771. His father was an eccentric English gentleman of moderate independence; his mother was the granddaughter of a French refugee; and Sydney, it was said, fairly represented both nations. He was educated at Winchester school, and New college, Oxford, and, having entered the church, became curate of Amesbury in Wiltshire. "The squire of the parish," he says, "took a fancy to me, and requested me to go with his son to reside at the university of Weimar; before we got there, Germany became the seat of war, and in stress of politics we put into Edinburgh, where I remained five years." During this time he officiated in the Episcopal chapel there, and published *Six Sermons* (1800). In conjunction with a few accomplished literary associates—Jeffrey, Horner, Brougham, Dr. Thomas Brown, Playfair, etc.—Smith started the *Edinburgh Review*, the first number of which appeared in Oct., 1802, constituting a new era in the history of periodical literature, and of independent thought and criticism in this country. In 1803 Smith removed to London, and was soon popular as a preacher, as a lecturer on moral philosophy (1804-6), and as a brilliant conversationist, the delight and wonder of society. Church preferment, however, came slowly. In 1806, during the short reign of the whigs, he obtained from lord Erskine, chancellor, the rectory of Foston-le-Clay, in Yorkshire; some eighteen years afterward the duke of Devonshire gave him the living of Londesborough, worth £700 per annum, to hold until Mr. Howard, son of the earl of Carlisle, came of age. In 1823 lord chancellor Lyndhurst presented him to a prebendal stall in Bristol, and enabled him to exchange Foston for Combe Florey, a more desirable rectory in Somersetshire. In 1831 earl Grey appointed him one of the canons residentiary of St. Paul's; and this completed his round of ecclesiastical preferments. He sighed for a mitre, but it never came; and lord Melbourne is said to have regretted this omission in his career as prime minister. The writings of Smith subsequent to 1800 were his contributions to the *Edinburgh Review*, which he collected and republished, with other miscellaneous works, in 1839; *Peter Pyndley's Letters*, written in 1807, to promote the cause of Catholic emancipation, and abounding in wit and irony worthy of Swift; *Sermons* in two volumes (1809); *Speeches on the Catholic Claims and Reform Bill* (1825-31); *Three Letters to Archdeacon Singleton on the Ecclesiastical Commission* (1837-39); *The Ballot*, a political pamphlet (1837); *Letter to Lord John Russell on the Church Bills* (1838); *Letters on Railways* (1842); *Letters on American Debts* (1843); etc. Though gay, exuberant, and witty to the last, Smith suffered from periodical attacks of gout and other complaints, and he died on Feb. 22, 1845. Ten years afterward, his daughter, wife of sir Henry Holland, physician, published a memoir of her father, with a selection from his letters.

The works of Smith were mostly written on temporary topics and controversies, yet they bid fair to take a permanent place in our literature as specimens of clear and vigorous reasoning, rich unctuous humor, and solid good sense. His jokes, exaggeration, and ridicule are all logical, driving home his argument; and his wit was sportive, untinctured with malice. His views on political and social questions were moderate, wise, and practical; and he lived to see most of them realized. He erred at times in treating sacred subjects with levity and seeming irreverence; but this fault was one of natural temperament, and had no root in infidelity. He was a sincere, benevolent, and a good man, a true patriot, and a happy Christian philosopher.

SMITH, THOMAS SOUTHWOOD, 1788-1861; b. England; educated at Edinburgh university, became a physician, and in 1820 removed to London, where he was one of the founders of the *Westminster Review*. He became eminent in his profession, published many medical treatises, and was prominent in the passing of the "anatomy act," in ameliorating the condition of children and other factory employees, and in the adoption of sanitary measures for London.

SMITH, WILLIAM, D.D., 1726-93; b. Scotland; graduated at the university of Aberdeen in 1747; came to America in 1750; had charge of a college in Philadelphia, 1751-52; returning to England was ordained in the church of England in 1753; was inaugurated

in 1754 provost of the university of Pennsylvania. His works were edited by bishop White in 8 vols.

SMITH, WILLIAM, 1769-1839; b. England; began life as a land-surveyor, became interested in the study of geology, made a careful examination into the geological strata of many parts of England, and collected a valuable museum of fossil remains, and prepared notes which have been published comparing the identity of formations where similar fossils were found. He made important geological discoveries for which he received the Wollaston medal from the geological society, 1831. He was a popular lecturer, and in 1828-34, took charge of the model farm of sir John V. B. Johnstone in Yorkshire. In 1838 he was commissioned to select the stone for the new parliament buildings, and subsequently received a government pension of £100. He pub. a treatise on *Irrigation*, 1806, *Mineral Survey or Deliniations of the Strata of England and Wales*, 1815, and other works; and also issued, 1819-24, 21 colored geological maps of English counties.

SMITH, WILLIAM, LL.D., D.C.L., b. London, 1813; graduated at the university of London, having won the first prizes in Latin and Greek; professor of Greek, Latin, and German, in Highburg and Homerton colleges (independent) and of the Greek and Latin languages and literature in New college, consolidated from the former two; classical examiner in university of London, 1853; and editor of *Quarterly Review*, 1867. He has published many approved classical school-books, an English-Latin dictionary, a Biblical and classical atlas, and a series of student's histories in which he was assisted by his brother Philip. His dictionaries of classical antiquities, biography, and mythology, of the Bible, and of Christian antiquities, have great value, and have attained a large circulation in England and the United States.

SMITH, WILLIAM FARRAR, b. St. Albans, Vt., 1824; otherwise known as "Baldy;" graduate of West Point, 1845; rose through successive grades to maj., 1863; assistant prof. of mathematics at West Point 1846-48 and 1855-56. He was assigned to the survey of the lake Superior region, Texas, and California, and was placed on the commission to decide the Mexican boundary line. At the beginning of the rebellion he was sec. of the light-house board, at Washington. He took command of the 3d Vt. vols., 1861, and was engaged in the first battle of Bull Run, on the Chickahominy, at South Mountain, Antietam, and Fredericksburg, in the latter commanding the 6th army corps. He was chief engineer of the department of the Cumberland, of the Mississippi, at Chattanooga, and Missionary Ridge. He commanded the 18th corps, army of the Potomac, 1864, and was present at Cold Harbor, and Petersburg; pres. International telegraph company 1864; brevetted col. for White Oak Swamp and Antietam; and maj. gen. for Chattanooga and gallant service throughout the war. Resigned, 1867, and for a time was on the police board of New York city.

SMITH, WILLIAM ROBERTSON, b. Scotland about 1848; graduated at the university of Aberdeen, and continued his studies at Bonn, Göttingen, and Berlin; was appointed assistant professor in the university of Edinburgh; and afterward professor of oriental languages and Old Testament exegesis in the Free church college at Aberdeen. When his article on "The Bible," in the new edition of the *Encyclopædia Britannica* appeared, it excited suspicions of heresy which in 1876 led to charges against him in the presbytery of Aberdeen, which referred the case to the general assembly. The assembly directed the presbytery to go on with the trial, and the presbytery referred the matter again to the assembly. Professor Smith having at length been suspended from his professorship and restored by the assembly, was, on the appearance of an additional article in the *Encyclopædia*, suspended again by the commission of the general assembly, and the case will again come before the assembly of this year (1881).

SMITH, WILLIAM STEPHENS, 1755-1816; b. N. Y.; educated at the college of New Jersey. He was aid-de-camp of Sullivan, Stenben, and Washington, successively; secretary of legation in London in 1785, to John Adams, whose daughter he married; surveyor of New York; a member of the assembly of that state, and of congress.

SMITH, WORTHINGTON, D.D., 1795-1856; b. Mass., graduated at Williams college, 1816; studied theology at Andover seminary, 1816-19; pastor of Congregational church at St. Alban's, 1823-49; and president of the university of Vermont, 1849-56. After his death a volume of his sermons was edited by professor Torrey.

SMITH COLLEGE, at Northampton, Mass., for the education of women exclusively, was founded in 1875 by the munificence of Miss Sophia Smith of Hadley, Mass. Its endowment amounts to \$400,000, and it has admirable buildings, valued at \$150,000. It has an ample and beautiful site in one of the most charming villages in the valley of the Connecticut. Its high standard of admission, and its curriculum, place it among colleges of the first rank. It has (1880) 24 professors and 135 students. L. Clark Seelye, D.D., president.

SMITHFIELD. This name has become so celebrated, in connection with a cattle-market in London that it has been applied to similar establishments elsewhere. Smithfield, in the 12th c., was an open spot which served the citizens as a playground and a place for a stroll. Being a little n. of Newgate, and w. of Aldersgate, it was outside the city walls. It was in Smithfield that the rebel Wat Tyler met his death in 1381. Several noted tournaments were held here; and the place is associated with trials by battle,

the burnings of martyrs, public executions during many centuries, and a variety of incidents connected with the history of the metropolis.

The most celebrated fair in England, Bartholomew fair (q.v.), was always held in Smithfield.

A cattle-market was held in Smithfield at least seven centuries ago, for Fitzstephen has mentioned it in 1150. The corporation had official control over the market for more than 500 years, dating from 1345; and the city authorities have never to this day relaxed their hold over the one only live-cattle market in the metropolis. At one time there was a project for removing the market to a field near Sadlers' Wells, at another to a spot near the n. end of Gray's Inn lane; while a spirited projector spent £100,000 in building a new market at Islington; but powerful influences prevented the removal of the cattle-market until 1855. The last market-day in the old spot was on June 11 in that year; after which the trade was transferred to the large and very complete establishment built by the corporation at Pentonville. For several years after this Smithfield was practically useless. In 1860, however, the corporation obtained an act for erecting market buildings on the site of Smithfield, and the first stone of a magnificent dead-meat market, from the designs of Mr. Horace Jones, the city architect, was laid in June, 1867. The building, which was formally opened in Nov., 1868, is 636 ft. long by 246 broad, is traversed by numerous avenues, and has about 200 shops for dealers in meat, which is partly country-killed. This arrangement has enabled the city authorities to abolish Newgate market, which had become a serious obstruction to city traffic. Under the market three railways, sunk deeply below the ground-level, traverse the area, one going eastward to Aldersgate and Finsbury, one southward to Ludgate and Blackfriars, and one north-westward to King's Cross and the n. of London. Near the middle of Smithfield is a circular spiral road descending to an underground railway goods-station. The remainder is laid out in well-paved carriage and foot ways, with a small ornamental green or garden, including paths, seats, and a drinking-fountain. There is also a new market for poultry, butter, cheese, pork, etc., distinct from the meat-market. The extensive new works and alterations have greatly improved the appearance of Smithfield, and increased its salubrity.

SMITHSONIAN INSTITUTION, at Washington, district of Columbia, was organized by act of congress in 1846, in accordance with the will of James Smithson, who bequeathed the reversion of an estate amounting to \$515,169 to the United States, to be devoted to "the increase and diffusion of knowledge among men." He was an Englishman, a natural son of Hugh, third duke of Northumberland, and Mrs. Elizabeth Macie, a niece of Charles, duke of Somerset. He devoted his life to scientific pursuits, especially to chemistry, and died at Genoa in 1829. The institution is governed by regents appointed by the federal government, and has erected a spacious edifice, with museum, library, cabinets of natural history, and lecture rooms, which occupies a prominent situation at Washington, the capital of the United States. It receives copies of all copyright books, and exchanges with other countries, and its museum is enriched with the gatherings of national exploring expeditions. A portion of its funds is devoted to scientific researches, and the publication of works too expensive for private enterprise. Under the active management of professor Joseph Henry, the secretary, have been organized departments of astronomy, ethnology, meteorology, and terrestrial magnetism. Among the publications already issued are the *Smithsonian Contributions to Knowledge*, 20 vols., 4to, distributed gratis to libraries; *Annual Reports*, and *Miscellaneous Collections*. The courses of public lectures by eminent scientific men are among the attractions of the American capital.

SMITHSONIAN INSTITUTION (*ante*), at Washington, D.C., founded on the bequest of James Smithson, an Englishman, to the government of the United States for the purpose of creating an establishment for the increase and diffusion of knowledge among mankind. The amount at first received, \$515,000, was subsequently increased by the residuary estate to \$541,000, which was deposited in the treasury as a perpetual loan, the interest to be employed forever in promoting the object of the testator. By the plan adopted, the accumulations of interest were first employed in erecting a commodious and secure building of imposing architecture as the home of the institution. The board of regents is composed of the chief-justice of the supreme court; three senators, appointed by the vice-president; three representatives, appointed by the speaker of the house; and six citizens, appointed by joint resolution of congress, two of whom must be residents of the district of Columbia, and no two can be of any one state. The regents choose one of their number as chancellor, and appoint a secretary who is director of the institution, chooses his own assistants, and conducts the active operations. Besides the regents, the president and vice-president of the United States, the cabinet officers, and such persons as they may elect honorary members, constitute the "establishment" styled the "Smithsonian Institution." When the trust was accepted widely different ideas were entertained in congress and by distinguished men throughout the country concerning the methods by which the object of the testator could be best attained. One proposed a university of the highest possible grade; another an observatory to surpass all others on the globe; another the cultivation of seeds and plants for distribution, with printing-presses, and courses of lectures on physical and moral science, government, and public law; a third, an institution for experiment and research in physical science, espe-

cially pertaining to useful arts and the development of the natural resources of the country; and a fourth, an establishment for rearing sheep, horses, and silk-worms, with a great library attached. The first secretary, the eminent Joseph Henry, at the time of his appointment professor in Princeton college, in entering on his office, drew up for the regents a scheme for the operation of the institution which they cordially adopted and have since maintained. Its leading principles are that as the testator's design was to increase and diffuse knowledge among mankind, the institution should spend its labor and resources on no object merely local, or even national; and should not devote its energies to anything which could be done as well by any existing organization. In accordance with these principles, in the progress of the institution, its library has been incorporated with the library of congress; its gallery of art transferred to the Corcoran art gallery; its meteorological observations to the U. S. signal service, of which they were taken as the foundation; its herbarium and entomological collections to the U. S. department of agriculture; and the national museum, deposited by law in the Smithsonian building, from the beginning was partly, and is now entirely, supported by the government. Having originated, developed, and finally transferred these branches of scientific pursuit, the institution devotes its energies and means: I. To the increase of human knowledge. To promote this object it issues three series of publications: 1. *Contributions to knowledge*. These are memoirs pertaining to every branch of physical science, and contain positive additions to knowledge, based on original research, but excluding everything resting on an unverified hypothesis. 2. *Miscellaneous collections*, consisting of monographs designed to facilitate the study of natural history. Papers presented for publication in either the first or second series are submitted to competent committees for examination, first, as to their being real additions to the existing knowledge of the subjects to which they pertain; second, whether as such they are worthy of publication by the institution. No restriction is made in favor of any particular branch of knowledge. The design is to stimulate men who have talents for original investigation to make researches, by offering to publish to the world an account of their discoveries, and to aid them in defraying the necessary expenses. Beyond this, apart from presenting to the author a few copies of his contribution, no remuneration is made; the publication under such favorable auspices, combined with the association of the author's name with Smithsonian's, being considered and accepted as a sufficient honorarium. 3. *Annual reports*, containing a statement to congress of the operations of the institution; with an appendix of translations from foreign books, biographies of distinguished scientists, ethnological and meteorological essays, correspondence, and accounts of unusual phenomena. II. The diffusion of knowledge is specially promoted by a system, early commenced and sedulously prosecuted, for the interchange of American and foreign scientific thought and achievement. This system has now attained great proportions. It brings nations, societies, and individuals into close communion. Through it the publications of the national government, as well as those of the institution, are exchanged. It is now familiarly known as the Smithsonian system of international exchanges, and is the medium for the exchange of scientific and literary materials between the United States and other nations. By means of it thousands of works, embracing the details of the latest inventions and discoveries, are brought to America; while, in turn, a knowledge is diffused abroad of whatever is done in the United States to advance, by the increase of knowledge, the welfare of men. There are now about 2,200 foreign societies in correspondence with the institution, besides many individuals, all freely sharing the benefits of the arrangement. The packages of exchanges are transmitted by the principal transportation companies of Christendom either without charge or at reduced rates, and are passed through all custom-houses free of duty. The actual expense of ocean transportation is borne by the institution.

In 1879 an appropriation was made by congress of \$250,000 for the erection, on the Smithsonian grounds, of a building for the national museum, which is under the charge of the institution, but has outgrown the accommodations possible in its one edifice; and of \$53,500 for several departments of the general work. The Smithsonian fund, at interest in the U. S. treasury, amounted, Jan. 2, 1880, to \$703,894. The distinguished services of prof. Henry, as the first secretary and director, extended from 1846 to his death in 1878; after which prof. Spencer F. Baird, who from 1850 had been his chosen assistant, was elected his successor, and now holds the position.

SMOKE-NUISANCE, in London, is punishable with fine. The act applies to every furnace employed in working engines by steam, and every furnace in any mill, factory, printing-house, dye-house, distillery, bake-house, etc., which is not constructed so as to consume its own smoke, or which is so negligently used that the smoke is not consumed. The penalty is from £2 to £5. The statute only applies to the metropolis and to the river Thames.—In Scotland a similar act is not confined to the Scotch metropolis.

Large consumers of fuel are naturally more anxious about how it can be best burned economically than about how the escape of smoke into the atmosphere can best be prevented. The two questions are not at all the same, although plans may be devised which will accomplish both objects at the same time. Thus with ordinary bituminous coal not only may the volatile hydrocarbons which sometimes yield 20 per cent of the heating-power pass up the chimney unburned, but nearly two-thirds of the coal may be

wasted by the conversion of the carbon into carbonic oxide instead of carbonic acid—that is if the carbonic oxide escapes as such—and yet no smoke may appear. At the same time it is the fact that the most complete combustion of the coal insures there being no smoke.

There is a great difference of opinion even about the apparently simple question of how the coal should be laid on the furnace bars. The late prof. Macquorn Rankine and others, reasoning on theoretical grounds, say that the fresh coals should be laid on the front of the fire; while Dr. Anderson, late of the Woolwich arsenal, judging from great practical experience, says that, on the contrary, they should be mainly piled up at the back of the fire. Mr. Wye Williams, again, whose name is so famous in connection with such questions, asserts that the coal is best spread evenly over the furnace bars.

Whether the fuel is heaped at the front, at the back, or spread uniformly over the fire, the end in view is the same. It is to secure that the volatile hydrocarbons are burned, and that the carbon is converted into carbonic acid, and this can only be done when these gases are conducted over a hot portion of the fire with a sufficient supply of air. If the fresh coal is laid on the front, that of a previous charge having been pushed inward, the coal vapors will of course pass over the thin layer of burning fuel at the back, and be more or less burned. When, on the other hand, the fuel is kept banked up at the back (that is at the bridge), and spread evenly over the rest of the grate, although a little smoke may be given off at first, it would, nevertheless, appear that by this plan the mass of incandescent fuel at the bridge is yet more effectual in burning these vapors. The balance of opinion would, however, seem to be in favor of the method of rapid, thin, and uniform spreading of the coal over the grate, care being taken that no part of the furnace bars are left bare.

With regard to the admission of air to the furnace, it is necessary, in order to obtain the best result, that it be admitted through small orifices, and at such a point or points where the temperature is sufficiently high for the combustion of the coal vapors, and that it be so regulated that heat is not uselessly absorbed by an excessive supply. It is of course also necessary to have sufficient air passing up between the furnace bars to burn the non-volatile coke. In the arrangement recommended by Mr. Wye Williams the fire is fed, as usual, through a door; it slopes downward to the bridge, which rises much above the fire-bars, so that the flames have to pass over it. The bridge consists of two parts, the solid masonry or brick-work and a chambered portion behind it, called the distributor. Into this a tube opens, through which a supply of atmospheric air enters, and, becoming heated, passes through a number of plates with slits, or with perforations, into the mixing chamber; here the heated air enters into combustion with the carbon in the smoke-laden flame, deprives it of that element, and greatly increases the heat by its combustion.

Smoke prevention arrangements may be classified as follows: I. Apparatus for the regular addition in small quantities and uniform application of the fuel to the fireplace of the furnace. The chief kinds are: (1) A hopper kept charged with small coal or slack, and feeding a rapidly rotating horizontal disk. (2) A hopper and rollers to reduce the size of the coals, and a screw spreader for throwing them on the fire. (3) An under grate stoker, which feeds a circular furnace by causing the fresh coal to pass from below through a central orifice into the middle of the incandescent fuel. (4) A hopper and traveling furnace bars. II. Arrangements for the admission of air above as well as below the furnace bars. This is usually done either by means of air-holes with slide or slides to cover them; or opening and shutting slits in the furnace door or above it. Another plan is to have a valve at the further end of tubular flues in the furnace to regulate the admission of air. In one or two instances a clockwork arrangement has been introduced for gradually closing the air inlets in the furnace doors after firing.

SMOKE-STACK, in a steam-vessel, is the group rising above the deck, and comprising the funnels (q.v.) and the several escape-pipes for the steam, which are beside it. In ships-of-war all these are frequently made telescopic, that they may be drawn down out of danger in action or in a strong headwind.

SMOLENSK, a government of European Russia, bounded on the e. by the governments of Moscow and Kaluga. Area, 21,554 sq. miles. Pop. 701,140,015. Smolensk, which is watered by the Dnieper, Dvina, Gshat, Oka, Iput, etc., is one of the most fertile provinces of the empire, and produces great quantities of corn, hemp, and flax. Extensive forests yield splendid timber and mast. The rearing of swine is much followed. Manufacturing industry and export trade are both largely expanding.

SMOLENSK, a fortified t. of Russia, capital of the government of the same name, is picturesquely situated on a range of steep declivities overlooking the river Dnieper, 250 m. w.s.w. of Moscow. It is one of the oldest towns in the empire, having been a place of note in the 9th c., is surrounded by massive walls (with 17 towers), and has 3 cathedrals, about 32 churches, and several monasteries, together with a diocesan seminary, a gymnasium, a military school for nobles, hospitals, etc. Smolensk carries on manufactures of linens, soap, leather, and carpets, and a considerable export trade in corn and flax. Pop. '67, 22,977. Smolensk is historically notable as the scene of a bloody repulse of the Russians, under Barclay de Tolly and prince Bagration, by Napoleon, Aug. 17, 1812, when on his march for Moscow.

SMOLLETT, TOBIAS, an eminent British novelist, b. in the year 1721, was descended from an old and distinguished family in Dumbartonshire. His grandfather, sir James Smollett of Bonhill, was one of the commissaries or consistorial judges of Edinburgh, and sat in the Scots parliament as representative of his native county. Had the novelist survived about four more years than the term of his too short life, he would, as heir of entail, have succeeded to the ancestral estate in the beautiful vale of Leven. He lost his father while very young; but he was well educated, and afterward apprenticed to a surgeon in Glasgow. He is said to have wished to enter the army, and being disappointed, to have avenged himself on his grandfather, who thwarted his inclinations, by describing sir James under the unamiable character of the old judge in *Roderick Random*. This is related by Scott and all the biographers, but it must be wrong; for sir James, the grandfather, died in 1721, when Tobias was only in his tenth year. The duty of attending to the education and settlement of the youth would naturally devolve on his widowed mother and on the laird of Bonhill, his cousin. It is certain, however, that Smollett inherited no fortune; and in his 18th year, he went to London with a tragedy which he had written on the assassination of James I. of Scotland, and which he trusted would lead to distinction, if not wealth. He was grievously disappointed, and was glad to accept the post of surgeon's-mate on board one of the ships in the unfortunate expedition to Carthage, in 1741. He soon quitted the service in disgust, although not before he had seen enough of naval life and character to be of inestimable value to him as a novelist; and returning to London, he commenced, and for the remainder of his life followed, the profession of an author. He made, indeed, repeated attempts to obtain practice as a physician, and in 1750, got a diploma of M.D. from Aberdeen; but his hasty irritable temper and independent spirit, joined to his natural propensity to satire, were fatal to his hopes. Even his literary career was a ceaseless warfare. In 1748, in his 27th year, he produced his *Roderick Random*, which was read with the utmost avidity, and seemed at once to place its author very near, if not in the actual rank of Fielding as a novelist. In 1751 appeared *Peregrine Pickle*, a more ambitious and not less successful work, and in 1753, *Ferdinand Count Fathom*, an inferior production, though containing scenes of striking adventure and eloquent description. Smollett next translated *Don Quixote* (1755), in which, it is admitted, he was surpassed by Motteux and Jarvis. He then undertook the editorship of a new Tory journal, *The Critical Review*, which was the most unfortunate of all his engagements, as it involved him in endless quarrels and personalities. For one article, an attack on admiral Knowles, he suffered three months' imprisonment, and was fined £100. In 1758 he published his *History of England*, 4 vols. quarto—a history from the descent of Julius Caesar to the treaty of Aix-la-Chapelle in 1748, but which was begun and completed in 14 months, realizing for its author a sum of £2,000. Though superficial and inaccurate, this history has passages of fine animated writing and masterly delineation of character. We next find Smollett involved in political controversy with Wilkes and others, and defending lord Bute's administration; but he wanted tact and temper for work of this description, and reaped no laurels as a politician. Another novel appeared in 1760-61, *The Adventures of Sir Lancelot Graecus*; in 1766 two volumes of querulous *Travels in France and Italy*; in 1769 *The Adventures of an Atom*, a political satire unworthy of its author; and in 1771, only a few months before his death, *The Expedition of Humphry Clinker*, the best of all the novels of Smollett; and in the opinion of Thackeray, one of the very best in the whole range of imaginative literature. Worn out with literary cares, private misfortunes, anxiety, and ill-health, the novelist retired to Italy, and died at Leghorn, Oct. 21, 1771, in the 51st year of his age.

As a novelist, Smollett is distinguished by his broad humor and burlesque, the great variety of his incidents and characters, and the excellence of his easy, picturesque style of narrative. He is often careless, but rarely dull. He does not indulge in digressions, like Fielding, and though less of a literary artist than his great English rival, his works are read with more intense interest. He had, in fact, greater imagination and poetical sensibility. He added largely to our stock of original characters and humorists—*Stap*, *Tom Bowling*, *Morgan the Welshman*, *Lismalago*, and *Matthew Bramble* are still unsurpassed. Delicacy of taste was denied to both Fielding and Smollett, and perhaps the latter is the more gross and sensual of the two. But the novelist lived in a coarse age, and possessed an exuberant fancy. There is a good deal to regret and to condemn; but to an author who has conferred so much true, healthy pleasure and enjoyment on countless generations of readers, forgiveness is easily extended, and is soon lost in admiration.

SMOLT. See SALMON.

SMORZA TO, or **SMORZANDO** (Ital. dying away), a musical term, indicating a gradual diminution in tone, till the sound altogether fades away.

SMUGGLING is the offense of importing or exporting goods prohibited, or without paying the duties imposed on goods not prohibited. The offense in general leads to forfeiture of the goods. If goods are imported to defraud the revenue, treble value of the goods is forfeited. Many of the offenses connected with smuggling are felonies, and punished with severity under the customs' consolidation act. Where high protective tariffs separate the industry of adjoining countries, smugglers are certain to abound; no prohibitory decrees can keep the goods out. It was in vain that Napoleon fulminated

the Berlin and Milan decrees for closing all continental ports against British shipping; British goods were landed at Salonica, passed on horseback through Hungary to Vienna, and thence distributed in all directions. Similarly, French manufactures reached England, often most circuitously: some a year in transit by way of Smyrna; others, *via* Archangel, after two years' journey. A vast cost was incurred in England in maintaining a coast guard and preventive service; but so long as smuggled goods could be sold at much lower prices than those at which they could be lawfully imported, so long would it be absolutely impossible wholly to suppress the traffic. The duties on French goods evaded in 1831, by the aid of smuggling, were estimated at £800,000. The true remedy for smuggling is a free, or, at least, very liberal tariff, without any prohibitive rates. Since the adoption of free trade by Great Britain, its coast-guard has ceased to have any preventive duties to perform, and has been converted into the far better institution of a defense for the coasts from foreign foes, a reserve of trained men for the sea-service, and last, though far from least, a branch of skillful auxiliaries ready to aid any ship thrown in distress upon the British coast. The leading instance of smuggling, so far as England or Englishmen are concerned, is the great amount of contraband traffic from Gibraltar into Spain.

SMUGGLING (*ante*), as a violation of those laws regulating commerce which are enacted by the U. S. congress under the powers given them in that regard by the constitution, is made a penal offense by the statutes of the general government. The main provisions of the present law (Rev. Stat., tit. xxxiv., chap. 10), are that the goods which are attempted to be introduced contrary to the tariff regulations or under false representations, shall be seized, and, on condemnation of the court, forfeited and sold, while the guilty party is liable to a fine of not more than \$5,000 and not less than \$50, and to imprisonment for not more than two years, or to both. Fines and penalties are also provided for officers of vessels conniving in smuggling or resisting the revenue officers. The procedure is in the U. S. district or circuit court, and is instituted by the district-attorney. After condemnation and sale, the proceeds minus costs and expenses are distributed, part going to the informer (if there were any such, distinct from the officers), part to the government, and part to the custom officers of the port or district. Very wide discretion and great powers are given, necessarily, to the officers employed in carrying out these laws. Their right of search extends four leagues from the coast. They may examine boxes, trunks, papers, letters, stores, warehouses, and all places where smuggled goods might be concealed. The person of a passenger is not exempt from search. Upon obtaining an order from the proper court, an officer may compel importing merchants, or others, to exhibit their books or bills of lading.

SMUT, the popular name of certain small fungi of the section *coniomycetes*, and group or family *uredines*, parasitical on plants, particularly on grasses, and notable for the great abundance of dark-colored spores which they throw off. The name smut, although somewhat variously used, is now very generally limited to the genus *ustilago*, in which the character just mentioned, of the profusion of dark-colored spores, is very remarkable. The name smut is often given to *ustilago segetum*, or *uredo segetum*, also called **DUST-BRAND**, a species very common and destructive, parasitic on wheat, barley, oats, and rye (see **ERGOT**), at the base of the germen and glumes, causing the death of the inner parts of the flower, and then converting the whole into a sooty dusty mass. At first, a fine mycelium alone is seen, which ere long produces spores. There is no disagreeable smell, as in some of the allied fungi. A remarkable kind of smut infests maize, swelling the ears to an enormous size, sometimes even a foot in length. No remedy or preventive is known for smut. It does not seem to be communicated through infected grains; but perennial plants attacked by fungi of this kind remain diseased in subsequent years. Some kinds of smut attack other parts of plants than those chosen by *ustilago segetum*. The reeds of the fenny districts of England are often much affected by a species (*ustilago typhoides*), which much impairs their quality for all purposes, and has the more remarkable property of greatly affecting the health of the laborers employed in cutting and sorting them, producing not only a sense of oppression, but swelling of the head, the formation of vesicles, and inflammation of the bowels, besides other symptoms, such as are often produced by cantharides. Mr. Berkeley says: "The subject is worth attention, not only as curious in itself, but because it is very possible that, like the ergot, the fungus may afford a valuable addition to the 'pharmacopœia.'"

SMYRNA, one of the most ancient and important cities of Asia Minor, and the only one of the Greek cities on the western coast which has retained its name and importance to the present day. The early history of Smyrna is very obscure: varying accounts represent it either as originally an Ionian colony, or as having been at first an Eolian city, which, by an act of treachery, fell into the hands of Colophonian (Ionian) exiles, and subsequently, about 700 B.C., formed part of the great Ionian league. This earliest city of Smyrna, known among the Greeks as "Old Smyrna," was situated on the banks of the little river Meles, on the n.e. side of the Hermæan gulf, now the gulf of Smyrna, and claimed the honor of being the birthplace of Homer; and here, near the source of the river, a grotto was shown, in which he was said to have composed his poems. This old city of Smyrna was destroyed, we are told, by the Lydian king Alyattes, and the place remained deserted and in ruins till after the Macedonian conquest,

when the city was rebuilt at the distance of between 2 and 3 m. s. of its original site. This city of "New Smyrna" was founded by Antigonos, and enlarged and embellished by Lysimachus; it was laid out with great magnificence, and adorned with several fine buildings, among which was the *Homereum*, where the poet was worshiped as a hero. The city had an excellent harbor; and from its admirable situation, soon became one of the finest and most flourishing in the world. In the early history of Christianity, Smyrna holds a distinguished place as one of the seven churches addressed in the Apocalypse, and as the scene of the labors and martyrdom of its first bishop, Polycarp. After various vicissitudes during the middle ages, it fell finally into the hands of the Turks, in whose possession it has since remained—the most flourishing city of the Levant.

The modern city of Smyrna (Turkish *Izmîr*) occupies the site of New Smyrna, being built partly on the plain at the head of the gulf, partly on the declivity of a hill, the ancient Mons Pagus, and, from the sea, has an attractive appearance. There are some good quays, and some handsome buildings of stone; but the greater part consists of low wooden houses, for the most part of one story high; and the streets, with a few exceptions, are ill-paved, narrow, crooked, and dirty. The city, however, in these respects is better than most other Turkish towns, and improvements have of late years been made. The pop. is estimated at 150,000; of whom 80,000 are Turks, 40,000 Greeks, 15,000 Jews, 10,000 Armenians, and 5,000 Franks. As is usual in Turkish towns, each people has its separate quarter. Smyrna contains several Greek, Armenian, Roman Catholic, and Protestant churches, and about 20 mosques. There are six journals published here in five different languages. The harbor is excellent; ships of large burden anchor close to the quays; and the trade is most important and extensive. A railway, 81 m. long, constructed mainly with English capital and by English engineers, has been recently opened to Aidin, an important inland commercial town, and is now in operation. Another railway, extending 61 m. inland (to Cassaba), was finished in 1866, and afterward extended to Philadelphia (Alasheir). The chief imports are woolen, cotton, and silk fabrics, iron, tin, lead, copper, steel, zinc, glass, and hardware goods, coffee to the amount of 6,000,000 lbs. annually, sugar, spirits, spices, indigo, cochineal, etc. The exports consist of wool, cotton, silk, carpets, hides, opium, madder, copper, valonia, olive-oil, drugs, and gums, figs, raisins, and many other articles. In 1874, 2,553 vessels (of which 355 were British), of 1,375,749 tons, entered and cleared the port; and the imports for that year amounted to £4,490,000; the exports to £3,940,000. Smyrna is regularly visited by the ships of the French, Austrian, and Russian steam-navigation companies, and by traders from Great Britain and other countries. It suffered severely from fire in the summers of 1841 and 1845, and has been often ravaged by earthquakes and the plague. The city and its territory are governed by a pasha. Of the ancient cities, not much remains. Some slight ruins mark the site of Old Smyrna. Of New Smyrna some remnants of the massive walls on the hill s.e. of the city are still to be seen; the site of the stadium in which Polycarp is supposed to have suffered martyrdom, is pointed out; there are some fragments of the ancient theater, and columns belonging to a temple; and numberless architectural fragments have been built into the walls of the Turkish town, or used in the construction of graves in the large Turkish cemetery.

SMYRNA GULF OF, an inlet of the Ægean sea, on the w. coast of Asiatic Turkey, is so called from the city of Smyrna (q.v.), which stands at its head. It is 40 m. long, is about 20 m. in greatest breadth, and contains several islands. Its waters are deep, and it affords good anchorage.

SMYTH, a co. in s.w. Virginia; drained by the three forks of the Holston river; traversed by the Atlantic, Mississippi and Ohio railroad; about 500 sq.m.; pop. '80, 12,159—12,131 of American birth, 1640 colored. The surface is mountainous and covered with forests, but the valleys are fertile; wheat, oats, cattle, and pork, are the staples. Co. seat, Marion.

SMYTH, CHARLES PIAZZI, b. 1820, England; for some time employed in the observatory at the cape of Good Hope, and afterward appointed royal astronomer of Scotland. He has long studied the great pyramid of Egypt, which, he maintains, was built by divine inspiration as a standard of weights and measures. He has advocated this peculiar theory in several books, such as *Our Inheritance in the Great Pyramid* (1864), and *Life and Work at the Great Pyramid* (1867).

SMYTH, JOHN, 1552-1610; b. England; graduated from Christ's college, Cambridge, 1575; took orders and became a fellow; but joined the Puritans after receiving a rebuke for advocating a Judaic observance of Sunday. He went to Amsterdam in 1606, became a Baptist, and was engaged in controversies with Ainsworth and others. He wrote several theological and controversial treatises, such as *A True Description of the Visible Church*; *The Character of the Beast*; and *Declaration of the Faith of the English People Remaining at Amsterdam*.

SMYTH, WILLIAM HENRY, 1788-1865; b. England; son of a loyalist of the American revolution, of New Jersey; descended from capt. John Smith; entered the British navy, 1805; served at Cadiz, 1810. He made a hydrographical survey of the coasts of Sicily,

and published *Atlas and Descriptive Memoir on Sicily*, 1824; made a survey of the coasts of the Adriatic, 1817, and of the Mediterranean, 1821; post-capt., 1824; rear admiral, 1853. He owned an astronomical observatory at his residence in Bedford, and another at his place in Cardiff. He was president of the Royal astronomical society, and hydrographer to the admiralty.

SNAIL, *Helix*, a genus of gasteropodous mollusks of the family *helicidae*, having generally a sub-globose, sometimes a depressed, spiral shell; the mouth of the shell more or less encroached upon by the last whorl but one, strengthened with an internal thickened rib, its edges more or less reflexed; the *foot* of the animal long, and pointed behind; the tentacles four, the lower pair much smaller than the upper; the tongue armed with many—often from 100 to 200—longitudinal rows of teeth. The species are very numerous, more than 1400 having been described; besides fossil species, of which also there are many. Some of the groups have been constituted into separate genera by recent authors, but all retain the popular name snail, which is indeed often extended to all the *helicidae*. As an instance of the general distribution of snails, it may be noticed that *Helix aspersa*, one of the common garden-snails of Britain, is found very generally throughout Europe, great part of Asia and the n. of Africa, and in South America.—Snails feed chiefly on vegetable substances, although they are very indiscriminate in their appetite, and even devour the dead of their own kind. The mischief which they do to garden-crops is too well known; and gardeners lay down cabbage-leaves and the like to attract them, in order that they may be destroyed; any greasy substance increasing the attractiveness of the bait.—Snails delight in warm moist weather; in dry weather their chief time of activity is during the night, and they hide themselves by day; but after rain they come forth at any hour in quest of food. At the approach of winter, or in very dry weather, they close the mouth of the shell with a membrane (*epiphragm*), formed by the drying of the mucous substance which they secrete, and become inactive and torpid. Some, as the edible snail (*H. pomatia*), make a succession of such membranes; the outer one of which is also strengthened by a quantity of calcareous matter, the secretion being at first a white viscid fluid, but quickly hardening like plaster of Paris. When this is to be removed, a fresh secretion of fluid mucus softens it at the edges. Snails retreat into crevices for the winter, or into holes which they make in the earth, and which are roofed over with earth, dead leaves, etc., agglutinated by secreted mucus.—Snails are hermaphrodite, but mutual impregnation takes place, and when they are about to copulate they excite each other by pricking or even piercing with a sharp, calcareous, glass-like style, adfixed to a peculiar muscular sac which serves for its protrusion, and which is produced by recent secretion, not being found in them on dissection, except at the season of reproduction. Extraordinary as this circumstance is, it has been the subject of much exaggeration, and in works on natural history not of very old date we read of snails throwing darts (*spicula amoris*) at each other, all which appears to be merely fabulous, although it is probable that the calcareous style may be often broken off in its use. The eggs of snails are round, and enveloped in a skin; they are generally deposited in little clusters. The eggs of the common garden-snails of Britain are about the size of peas, and are deposited just under the surface of the soil.—Snails possess in a very high degree the power of repairing injuries, not only of the shell—although the removal of the whole shell is fatal to them—but also of the soft parts. When the tentacles are cut off, they grow again; and even if the head is cut off, a new head is produced.—We do not think it necessary to describe any of the common British species, as there is nothing of peculiar interest connected with any of them; and the rarer and smaller species have still less claim to notice. The **EDIBLE SNAIL** (*H. pomatia*) of the s. of Europe is the only one that deserves to be particularly mentioned. It is found in the chalk and oolite districts of the s. of England, where it is said to have been introduced from the continent in the 17th c.; but this is very doubtful. It has a shell about 2 in. in diameter and 2 in. in height, whitish or pale tawny, with four darker bands, often not very distinct. It was much esteemed as an article of food by the ancient Romans, who fattened their snails in inclosures (*cochlearia*) made for the purpose, feeding them delicately on meal and boiled wine. It is still in much esteem for the table in various parts of Europe, and is occasionally used in England. Nor is it the only species so used; the common garden-snails are probably equally good, although not so large, and "the glassmen at Newcastle once a year have a snail-feast; they generally collect the snails themselves in the fields and hedges the Sunday before the feast-day."—Turton's *British Land and Fresh-water Shells*. Snails of different species are also an article of exportation on a small scale from England to the United States, packed in old casks, in which they are conveyed very well, fixing themselves one upon another to the cask, and leaving a vacant space in the center. Snails boiled in milk are popularly regarded as a remedy for diseases of the chest, and for this purpose they are brought to Covent Garden market. If any benefit results from the use of them, it is probably due to their nutritious qualities.—Some of the tropical species of *helix* are very large, and some have very beautiful shells.

SNAKE, a term synonymous with serpent.—The name **COMMON SNAKE** is very generally given in England to a species very abundant in most parts of that country, and throughout Europe from the s. of Scandinavia to the Mediterranean, although there is

only one doubtful instance of its having been found in Scotland. Its range extends also over great part of the n. of Asia. This species (*natrix torquata* or *tropidonotus natrix*) is also known as the RINGED SNAKE and the GRASS SNAKE. It belongs to the family *colubridæ*, and to a section of it which some naturalists constitute into the family *natrixidæ*. It grows to the length of 4 and even 5 ft., although specimens exceeding 3 ft. are rare. The female, as in serpents generally, is much larger than the male. The head is ovate, the muzzle rather narrow, the back part considerably broader than the neck; the body thickens toward the middle, and again tapers toward the tail, which is about one-fifth of the entire length, tapering to a rather sharp point; the gape is wide; the upper part of the head covered with large plates; the scales of the back have an elevated keel; those of the sides are larger, the keel merely rudimentary; the belly is covered with broad oblong plates; the under part of the tail has plates arranged in two rows. The teeth are very small, directed backward, and arranged in two rows on each side of the jaws. The upper parts are grayish brown, tinged with green; at the back of the head are two crescent-shaped bright yellow spots, forming a kind of ring or collar; immediately behind these are two broad black spots, sometimes confluent. Two rows of small black spots are arranged alternately down the back, and larger ones at the sides; but these vary much in size and other particulars. The belly is pale lead color, often marbled with black. The outer skin is changed at intervals varying according to the weather and other circumstances. Mr. Bell says: "I have known the skin shed four or five times during the year. It is always thrown off by reversing it: so that the transparent covering of the eyes, and that of the scales also, are always found concave in the exuvie. Previously to this curious circumstance taking place, the whole cuticle becomes somewhat opaque, the eyes are dim, and the animal is evidently blind. It also becomes more or less inactive, until at length, when the skin is ready to be removed, being everywhere detached, and the new skin perfectly hard underneath, the animal bursts it at the neck, and creeping through some dense herbage, or low brushwood, leaves it attached, and comes forth in far brighter and clearer colors than before." This snake is partial to damp situations, and often enters water, in which it swims with great ease, moving with singular gracefulness. It sometimes remains at the bottom for a considerable time. It sometimes climbs trees, its body, when ascending the stem, being "straight and rigid as a stick." See SERPENTS. It is very voracious; its food consists of frogs, small birds and quadrupeds, etc. Its teeth being incapable of tearing, cutting, or masticating food, the prey is always swallowed entire and living. Mr. Bell heard a frog emit a cry some minutes after it had been swallowed by a snake. The snake has no poison-fangs. It has another kind of defensive armor, in certain glands, which emit a volatile substance of most offensive and penetrating odor, which, like that of the skunk, can hardly be removed from the skin or clothes. No such odor is emitted except in moments of irritation or other passion. The common snake is oviparous: its eggs—usually about fifteen or twenty in number, whitish, with a parchment-like skin, and united into a string by a glutinous substance—are deposited in moist and warm situations, often in dunghills. The mother is said sometimes to coil herself around them, but generally leaves them unregarded. This snake is capable of being tamed, and becomes familiar with those who are kind to it, while the approach of a stranger, of a dog or cat, alarms it, and causes an emission of stench. In winter, it seeks some refuge from severe cold, and becomes lethargic or dormant. Large numbers of snakes often take refuge in one hole; but seldom so many as in an instance recorded by Dr. Carpenter, in which about 1390 were found in an old lime-kiln.

Much interest was excited in 1862 by the discovery in England of a species of snake, *coronella lavis* (see CORONELLA and SERPENTS), previously unobserved in Britain, but common in the middle and s. of Europe, and sometimes distinguished by the name of AUSTRIAN SNAKE, sometimes by that of SMOOTH SNAKE, none of the scales being ridged or keeled, as in the common snake. It inhabits much drier situations than those affected by the common snake, where it is often found in company with the sand lizard, situations more resembling those in which the viper is found. This snake is also more similar to the viper in form and appearance than the common snake, and these circumstances have probably led to its being often mistaken for the viper, and its existence in England remaining unnoticed so long. It attains a length of about 2 ft.; is of a shining brown color, ornamented with checkered irregular patches of black; a yellow mark on the back and sides of the head; the lower parts yellowish, with square black spots. The head is not flattened, as in the viper, but is narrowed in a similar way toward the neck; there is much difference in the plates of the head; the yellow mark on the head is a very characteristic distinction, and the back does not exhibit a broad zigzag pattern, as in the viper. Unlike the common snake, the *coronella lavis* is ovoviviparous, the eggs being hatched within the mother. For an illustration of the *coronella lavis*, see SERPENTS.

SNAKE-BIRD. See DARTER.

SNAKE-EEL. the popular name of the fishes forming the family *ophisuridæ* of some naturalists, included by others, with all the eels, in the family *murænidæ*, and distinguished by the want of a tail-fin, and the tail ending in a conical point like that of a serpent. They are inhabitants of the seas of warm climates. One species, *ophisurus serpens*, is found in the Mediterranean. It attains the length of about 6 ft., and the

thickness of man's arm; is brown above, silvery beneath, and has a slender and pointed snout.

SNAKE RIVER, also called **LEWIS'S FORK**, is the great southern branch of the Columbia (q.v.).

SNAKE RIVER (*ante*), or **SHOSHONE**, or **LEWIS, RIVER**. See **IDAHO**.

SNAKE-ROOT. See **POLYGALA** and **ARISTOLOCHIA**.

SNAKE-STONES, small round pieces of stone or other hard substance, popularly believed to be efficacious in curing snake-bites. A belief in their efficacy has been long and very widely diffused, and probably extended to Britain and other western parts of the world from the east. Small perforated balls and rings of various kinds of stone, ivory, etc., strung together like beads, were formerly used as snake-stones in Scotland, being given to cattle to chew when they were bitten by vipers. Of course they could only be expected to act as a kind of charm. Many of the snake-stones used in India and the further east seem to be of no greater value. Some of them, however, appear to be really efficacious, being applied to the wound and absorbing blood from it with the poison before it has entered the system. Remarkable instances are related of speedy cures thus effected. The snake-stone adheres for a short time to the wound, and then falls off. The wounded limb is meanwhile rubbed downward. Two small snake-stones, each the size of a large pea, brought from India, and which were known to have cured a man bitten by a cobra, were found by Mr. Quekett to be composed of some vegetable matter. Another, also known to have cured a cobra's bite, having been brought from Ceylon by sir James E. Tennent, was examined by Mr. Faraday, and was deemed by him to be "a piece of charred bone, which has been filled with blood, perhaps several times, and then carefully charred again."—See Buckland's *Curiosities of Natural History*, and Tennent's *Ceylon*, vol. i.

SNAKE-WEED, another name of **Bistort** (q.v.).

SNAKE-WOOD, another name of **Letter-wood** (q.v.).

SNAPDRAGON, *Antirrhinum*, a genus of plants of the natural order *Scrophulariaceæ*, consisting of annual and perennial herbaceous plants, chiefly natives of the temperate parts of the northern hemisphere. They have the calyx 5-parted; the corolla swollen at the base, but without a spur, and *personate* (Lat. *persona*, a mask), i. e., its mouth closed by the pressure of the lower against the upper lip; and the fruit is a 2-celled oblique capsule, opening by three pores at the apex. The English name refers to a peculiarity of the corolla, the lower lip of which, if forcibly parted from the upper, so as to open the mouth, shuts with an elastic spring or snap. Some of the species have very pretty flowers. *A. majus* has long been a favorite in our gardens, in which there are many fine varieties of it.

SNAPHAUNCE, an old musket of the 17th and first half of the 18th c., called also **Asnapian**. See **Lock**.

SNAPPING TURTLE, a name applied in the United States to different species of tortoises. The best known is the *chelydra serpentina*, of the northern, and most of the southern states, inhabiting small streams and marshes. It is said to sometimes attain a length of 4 feet, and to weigh 50 lbs. Its more common size is from 8 to 15 lbs. It has an immovable plastron, a large head, and is very fierce, snapping at its enemies, and its food. Another kind of snapping-turtle, known in the southern states, extending from Florida to western Texas, and up the Mississippi and Missouri rivers is the *macrochelys temminckii*, generally known as the alligator-turtle. It is said to sometimes attain a weight of 100 lbs. Both of these species belong to the family *chelydridæ*, and are distinguished from all other turtles of the United States by the long and imperfectly retractile neck and tail, and the cruciform plastron or lower shell. Both these turtles are used as food, and by some are highly prized for making soup; but they are inferior to the sea-turtle. The name of snapping-turtle is sometimes applied to soft-shelled turtles of the family *trionychidæ*, because they also snap at their food and other objects.

SNEEHATTEN. See **NORWAY**.

SNEEK, a prosperous trading and manufacturing t. in the Netherlands, province of Friesland, 13 m. s.s.w. of Leeuwarden. It is built in the form of an irregular triangle, has three canals, and good water-way to the sea. Rich meadow-lands, in some places tending to be marshy, surround the town, and in the neighborhood is a considerable lake called the Sneekmeer. Pop. (Jan. 1, 1875) 9,654—6,972 Reformed, and 1450 Roman Catholics, the remainder chiefly Baptists, except 150 Jews. Sneek is the largest butter and cheese market in the province; the quantity sold reaching 5,000,000 lbs. of butter, and 2,250,000 lbs. of cheese annually. The principal buildings are the Reformed church, town house, Baptist church, and Jewish synagogue.

SNEEZE-WOOD, *Pteryxylon utile*, a tree of the natural order *sapindacæ*, a native of South Africa, common in the eastern districts of Cape Colony. The timber rivals mahogany in beauty, takes a fine polish, is very solid, strong, and durable. It receives its English name, and its Dutch name, *nieshout*, from the sternutatory properties of its gawdust, by which workmen are often much annoyed.

SNELL, EBENEZER STRONG, LL D, 1801-76; b. Mass., graduated at Amherst college, where he has been continuously an instructor for over 50 years, and since 1834 prof. of mathematics and natural philosophy. He edited several text-books.

SNELL, WILLEBRORD, 1591-1626; b. Leyden, son of Rudolph Snell, was professor of mathematics at the university at Leyden, succeeding his father, and the discoverer, according to Huygens and Vossius, of the law of the refraction of light attributed to Descartes. He was a friend of Kepler. He published (1617), *Eratosthenes Batusus sive de Terræ Ambitus vera Quantitate*, describing his method of calculating the size of the earth, and *Cyclometricus* (1621).

SNELL EXHIBITIONS. These exhibitions were founded in the year 1677 by John Snell of Uffeton, in the county of Warwick, for the purpose of educating Scottish students at the university of Oxford. Snell was born in the parish of Colmonell, in Ayrshire, in 1629, and entered the university of Glasgow in 1644. He afterward removed to England, where after holding several offices of a legal nature, he was appointed seal-bearer to the court of chancery. He died at Holywell, near Oxford, in 1679, leaving his estate of Uffeton, near Leamington, to trustees (the vice-chancellor of the university of Oxford, the provost of Queen's college, the master of Balliol college, and the president of St. John's college), for the foundation of the scholarships which bear his name (at present 14 in number). The exhibitions have been the subject of much litigation in the court of chancery, and are now administered under a scheme settled in 1861. The exhibitioners are nominated by the college of Glasgow, and received about £110 annually each during five years. Candidates for these scholarships must have been in born in Scotland, or must be sons of fathers born in Scotland, and must have resided for two years at least in Glasgow college, or for one year in that college, and two at least in some other college in Scotland. None are admitted to examination who have completed their 21st year, or have been members of the university of Oxford of more than two years' standing from the day of their matriculation inclusive. Two exhibitioners are nominated annually after public competition. The list of Snell exhibitioners includes not a few well-known names, such as J. G. Lockhart, sir W. Hamilton, the present archbishop of Canterbury (Tait), etc.

SNIA TYN, a t. of Galicia, in Austrian Poland, is situated on the Pruth, and was formerly a frontier stronghold. It has tanneries, and a considerable trade in cattle and horses. Pop. '69, 10,598, among whom are many members of the Armenian church.

SNIDER RIFLE, a form of breech-loader which was adopted in 1866 by the British government, by altering the old Enfield muzzle-loaders in accordance with the Snider system. The main features of the Snider rifle are: that the breech-block revolves about an axis of its own, which is parallel to the axis of the bore and to its right, and that the firing-pin reaches the base of the cartridge at its center by passing obliquely from the nose of the hammer through the breech-block.

SNIPE, *Scolopax*, a genus of birds of the family *scolopacilæ* (q.v.), having a very long straight bill, with nasal grooves extending almost to the tip, which expands a little, the upper mandible slightly exceeding the lower in length, the whole bill soft and very sensitive, smooth and shining in the living bird, but soon after death becoming pitted like the end of a thumb by drying. The head is compressed; the eyes large, and placed far back in the head, an evident adaptation to the mode of life, enabling the bird to guard against danger, while its bill is plunged in the mud. The feet have three toes before, divided to the base or very nearly so, not edged by membrane, the hind-toe short. The tail is short. The genus naturally divides itself into two sections, sometimes regarded as distinct genera, the first consisting of the woodcocks (q.v.), to which the generic name *scolopax* is appropriated; the second containing the species popularly known as snipes, which receive the generic name *gallinago*, and are distinguished by their lighter form, by their longer legs, and by having a little of the lower part of the tibia bare.—The COMMON SNIPE (*S. gallinago*, or *gallinago media*) is about 11 in. in entire length, the bill almost 3 inches. The sexes are alike in plumage, but the female is rather larger than the male. The general color of the upper parts is blackish brown, finely mixed with pale brown and with a rich buff color; three pale brown streaks along the head; the neck and breast pale rust color mottled with black; the belly white. The tail consists of 14 feathers. The snipe, when flushed, changes its course several times in a zigzag manner in the air, and then darts off very swiftly, so that young sportsmen find it a very difficult bird to shoot. The snipe makes a very inartificial nest of a little dry herbage, in a depression of the ground, or sometimes in a tuft of grass or rushes. The eggs are four in number, pale yellowish or greenish white, the larger end spotted with brown. This species of snipe is plentiful in all the moory and marshy parts of Britain, and generally throughout Europe, also in some parts of Asia, and it is found in the n. of Africa. It breeds in Britain, even in the s. of England, although many of the snipes which spend the winter in Britain migrate northward in spring. The snipe is capable of being tamed, and becomes very familiar, but is difficult to keep from the prodigious quantity of worms and other such food which it requires. A tame snipe has been known to eat nearly twice its own weight of worms in 12 hours. The snipe is in high esteem for the table, and is included among game in Britain.—The habits of all the other spe-

cies of snipe correspond very nearly with those of the common snipe. The **GREAT SNIPE**, or **SOLITARY SNIPE** (*S. or G. major*), is comparatively a rare bird in Britain, but abounds in the extensive marshes of continental Europe, and is found also in Asia. Its entire length is about 12½ in., the bill not quite so long in proportion as that of the common snipe. There are 16 feathers in the tail.—The **JACK SNIPE**, or **JUPCOCK** (*S. or G. galinula*), the smallest of the British species, is like the common snipe in plumage. It is common in Britain, but mostly as a winter visitant, and is found also during summer or winter, in most parts of Europe and of the n. of Asia.—North America has a number of species. The **COMMON AMERICAN SNIPE** (*S. or G. arizonæ*) is about equal in size to the common snipe of Europe, and much resembles it also in plumage. The tail has 16 feathers. This species is abundant in summer in the northern parts of the United States and in Canada, in the more southern states in winter. It is in much request for the table, and is often caught in snares.—Snipes are found also in other parts of the world. The name snipe is extended in popular usage to include the genus *macrorhamphus*, in which the outer toes are connected at the base by a membrane. In other characters, as well as in plumage and habits, the similarity to the true snipes is very great. The **RED-BREASTED SNIPE**, or **BROWN SNIPE** (*M. griseus*), of North America has been occasionally seen in Britain and in Scandinavia. In size it is nearly equal to the common snipe.

SNIPE FISH. See **TRUMPET FISH**.

SNI ZORT, **Loch**, a large and picturesque inlet of the sea, in the n.w. of Skye (q.v.), between Trotternish point and Vaternish point. At its head, the loch is only a few furlongs broad; but it gradually expands, and at its entrance the breadth is over 7 miles. It is 13 m. long.

SNOHOMISH, a co. in n.w. Washington territory, having Admiralty inlet on the w.; drained by the Snoqualine and Steilacquamish rivers; 1500 sq. m.; pop. '80, 1387—1074 of American birth, 365 colored. The Cascade range forms its e. boundary, and on its slopes and by the streams are extensive tracts of wood land and groves of fir and spruce. Lumber is the chief source of revenue. Near the inlet are cranberry marshes, and the soil of the plains is adapted to the production of grain, and to stock-raising. Co. seat, Snohomish.

SNORRI STURLESSON, a learned historian, and a distinguished Icelandic politician, was b. in 1178 at Hvamma, in Iceland, where his family, who traced their descent to the ancient kings of Norway and Sweden, had been settled since the early colonization of the island. Snorri Sturlesson was placed at an early age under the care of Jon Loftson, the grandson of Semund Sigfusson, the learned, compiler of the old Edda, by whom he was instructed in the history, mythology, and poetry of the n., as well as in classical literature. By his marriage, at the age of 26, with a rich heiress, and the speedy death of his father, Snorri Sturlesson early attained a position of wealth and influence, and by the free choice of the people, was elected supreme judge, or chief magistrate of the island. In this post, he was distinguished for his profound knowledge of the laws and civil institutions of his native country; but his ambition, avarice, and love of intrigue embroiled him personally in sanguinary feuds, and contributed to hasten the destruction of Icelandic independence. His love of intrigue led him to take part in the intestine troubles of Norway, and thus drew upon him the suspicion and ill-will of the Norwegian king, Hakon, who sent secret instructions to Iceland for his arrest; or, if need be, his assassination. The king's intentions were carried out to their fullest extent; and his numerous enemies joining together in a plot against him, Snorri Sturlesson was attacked in his own house, and murdered in the year 1241. Snorri Sturlesson was a poet of no mean order, and composed numerous *drapas*, or laudatory poems, on the kings and jarls at whose courts he sojourned. His great work is the *Heimskringla*, or Mythic Ring of the World, in which he records the history of the kings of Norway from the earliest times to the death of Magnus Erlingsson, in 1177; and which he compiled from ancient genealogical tables and other documents. It was translated into Danish about 1559 by Peder Clauson, and published first by Olaf Worm (Cop. 1633). This translation has been republished in more recent times by Gruntvig (3 vols., Cop. 1818-22) and others. German, Swedish, and Latin versions have also been executed. Snorri Sturlesson is believed to have had a share in collecting and arranging the songs of the elder or poetic Edda (q.v.), and to have contributed very materially toward the compilation of the Skalda and other parts of the younger or prose Edda.

SNOW is the frozen moisture which falls from the atmosphere when the temperature is 32 or lower. It is composed of crystals, usually in the form of six-pointed stars, of which about 1000 different kinds have been already observed, and many of them figured, by Scoresby, Glaisher, and others. These numerous forms have been reduced to the following five principal varieties—1. Thin plates, the most numerous class, containing several hundred forms of the rarest and most exquisite beauty. 2. A spherical nucleus or plane figure studded with needle-shaped crystals. 3. Six or more rarely three-sided prismatic crystals. 4. Pyramids of six sides. 5. Prismatic crystals, having at the ends and middle thin plates perpendicular to their length. The forms of the crystals in the same fall of snow are generally similar to each other. The crystals of hoar-frost being formed on leaves and other bodies disturbing the temperature, are often irregular and

opaque; and it has been observed that each tree or shrub has its own peculiar crystals. Snow-flakes vary from an in. to $\frac{1}{100}$ of an in. in diameter, the largest occurring when the temperature is near 32° , and the smallest at very low temperatures. As air has a smaller capacity for retaining its vapor as the temperature sinks, it follows that the aqueous precipitation, snow or rain, is much less in polar than in temperate regions. The white color of snow is the result of the combination of the different prismatic rays issuing from the *minute* snow-crystals. Pounded glass and foam are analogous cases of the prismatic colors blending together and forming the white light out of which they had been originally formed. It may be added that the air contained in the crystals intensifies the whiteness of the snow. See RED SNOW. The limit of the fall of snow coincides nearly with 30° n. lat., which includes nearly the whole of Europe; on traversing the Atlantic, it rises to 45° , but on nearing America descends to near Charleston; rises on the w. of America to 47° , and again falls to 40° in the Pacific. It corresponds nearly with the winter isothermal of 52° Fah. Snow is unknown at Gibraltar; at Paris, it falls 12 days on an average annually, and at St. Petersburg 170 days. It is from 10 to 12 times lighter than an equal bulk of water. From its loose texture, and its containing about 10 times its bulk of air, it is a very bad conductor of heat, and thus forms an admirable covering for the earth from the effects of radiation—it is not unfrequently happening, in times of great cold, that the soil is $40'$ warmer than the surface of the overlying snow. The flooding of rivers from the melting of the snow on mountains in summer, carries fertility into regions which would otherwise remain barren wastes. See GLACIER.

SNOW-BALL TREE. See GUELDER ROSE.

SNOWBERRY, *Symphoricarpos*, or *Symphoria racemosa*, a bushy deciduous shrub of the natural order *caprifoliaceæ*, a native of the northern parts of North America, and now very common in British shrubberies. It has simple leaves and small flowers; berries about the size of black currants, remaining on the bush after the leaves, quite white, but uneatable.—The name SNOWBERRY is also given to *Gaultheria scrypyllifolia*, a native of the bogs of North America.

SNOW-BIRD, *Junco*, or *Fringilla hyemalis*, a North American bird of the finch family (*fringillidæ*), common from Louisiana to the fur countries, in all the eastern parts of North America. The wings are rather short, the tail slightly notched. The whole length is rather more than 6 in.; the upper parts are lead-color, the lower parts white, the two outer tail-feathers white, the next white margined with black. This bird migrates northward early in spring, and southward late in autumn. It is often to be seen in small flocks, visiting barn-yards, and hopping about with the domestic poultry. In cold weather, it retires to holes in haystacks. Its song is sweet. From its frequent familiar approach to human habitations, the snow-bird is regarded with favor throughout great part of North America, as the redbreast is in Britain. In the s., however, it is often brought to market, its flesh being very pleasant. In the western parts of North America, another, but very similar species, the OREGON SNOW-FINCH (*P. Oregona*), takes the place of this.

SNOW-BUNTING, or SNOW-FLECK, *Plectrophenax nivalis*, a bird of the bunting family (*emberizidæ*), of a genus distinguished from the true buntings by the long and nearly straight claw of the hind-toe, in this resembling the larks. There is also an approach to larks in habits; there is a similar ease and celerity in running along the ground, and the song is very different from that of any of the true buntings. The snow-bunting abounds in summer in all parts of the arctic regions, and in winter in more southern countries of Europe, Asia, and America. Linnaeus says it is the only living creature that has been seen 2,000 ft. above the limits of perpetual snow on the mountains of Lapland. Great flocks are seen in Britain, particularly in severe winters, generally frequenting uplands in mild weather, but descending to the low grounds and seashore in hard frosts. Comparatively few visit the s. of England. A few remain during summer on the highest mountains of Scotland. The nest is placed on the ground, or in a crevice of a rock. The snow-bunting is generally very fat, and is highly esteemed for the table. The Greenlanders kill great numbers, and dry them for winter use.

SNOWDON, a mountain-range in Caernarvonshire, n. Wales, stretches in a n.e.n. direction from a point 5 m. n. of Cricceith, near the head of Cardigan bay, to near Conway; but is broken up by valleys and river-courses into four mountain-groups, whose chief peaks are Carnedd-Llewelyn, 3,460 ft.; Moel-Siabod, 2,878 ft.; and Moel-y-Wyddfa ("the conspicuous peak"), the highest mountain in s. Britain, 3,571 ft. above sea-level. Seen from the top, Moel-y-Wyddfa, the "King of Snowdonia," appears to send out three ridges, which gradually divide and subdivide, giving birth to numerous valleys and corries. The ascent of the highest peak of Snowdon is effected by tourists from Llanberis (on the n.), Beddgelert (on the s.), Llyn-Cwellyn (on the w.), and Capel Curig (on the e.); the first is shortest and easiest; the last is longest, most difficult, but at the same time by far the grandest. The district of "Snowdonia" was made a royal forest by Edward I. of England, but was disafforested in 1649.

SNOW-DROP, *Galanthus*, a genus of plants of the natural order *amaryllidæ*, of the same tribe with amaryllis, snowflake, crinum, etc. The three outer segments of the

perianth spread, so as to make a bell-shaped flower; the three inner are shorter, erect, and notched at the summit. The flowers arise from a spathe. The root is bulbous, and produces two leaves and one single-flowered leafless stem (*scape*). The common snow-drop (*G. nivalis*), a plant too well known to need description, is a native chiefly of the s. of Europe, growing in woods and pastures. It is found apparently wild in some places both in England and Scotland, but is probably rather naturalized than native, having long been much cultivated in gardens. Another species of snow-drop (*G. phacelus*), with much broader leaves, is found in the s. of Russia and in Asiatic Turkey.

SNOW-DROP TREE, or **SILVER-BELL TREE**, a popular name for a genus of styrax, *Halesia tetraptera* and *H. diptera*, named after Stephen Hales, author of *Vegetable Statics*. They are shrubs or small trees, with large and veiny pointed deciduous leaves, and showy white flowers, drooping on slender pedicels in short racemes or clusters from axillary buds of the preceding year. Calyx inversely conical, 4-toothed; petals 4, united at the base, or middle, into an open bell-shaped corolla; stamens, 8 to 16; filaments united into a ring at the base; ovules 4 in each cell; fruit large and dry, 2 to 4 winged; seeds single, cylindrical. They are beautiful shrubs for cultivation. A third species grows in Florida, *H. parviflora*.

SNOW-FLAKE, a popular name for the *Leucojum vernum*, *L. aestivum*, and *L. autumnale*, species of European herbs of the amaryllis family which have been introduced into gardens in the United States. They are among the hardy bulbous plants. See **AMARYLLIDÆ**, *ante*, and **SNOWDROP**, *ante*.

SNOW-LINE. The snow-line marks that height above the sea-level below which all the snow that falls annually melts during summer; higher than this lies the region of perpetual snow. No general rule for the height of this line can be given, owing to the different causes which may determine it. These are—the situation of the slope in respect of the sun's rays, and hence, other things being equal, it is higher on the s. than on the n. side of mountains; the situation with respect to the rain-bringing winds; the steepness of the slope; and the dryness or humidity of the region. The following are the observed heights of the snow-line in English feet in different parts of the globe:

	N. Lat.	Height.
Spitzbergen.....	78	0
Sulitelma, Lapland.....	67	3,885
Kamchatka.....	59½	5,249
Unalashka, W. America.....	56½	3,510
Altai.....	50	7,034
Alps.....	46	8,885
Caucasus.....	43	11,063
Pyrenees.....	42¼	8,950
Rocky Mountains.....	43	12,467
North Himalaya.....	29	19,560
South Himalaya.....	28	15,500
Mountains of Abyssinia.....	13	11,065
Purace, Colombia.....	2¼	15,381

	S. Lat.	Height.
Nevados of Quito.....	0	15,820
Arequipa, Bolivia.....	16	17,717
Paichata, Bolivia.....	18	20,079
Portillo, Chili.....	23	1,473
Cordilleras, Chili.....	42¼	6,010
Magellan, Strait.....	53½	3,707

From lat. 0° to 20° it sinks only a very little; from 20° to 70° it continues to fall equally; but from 70° to 78° it sinks with great rapidity. To this general statement there are some important exceptions. It is about 4,000 ft. higher on the n. than it is on the s. side of the Himalaya, owing to the greater depth of snow that falls on the s. side; to the greater dryness of the climate of Tibet, which increases the evaporation and the heating power of the sun's rays; and to the naked rocks and soil of the n. absorbing more heat than surfaces covered with vegetation. It is higher in the center of continents than near the coasts (the rain being less and the heat greater), as seen on comparing the Pyrenees and Caucasus; and on the e. than on the w. coasts of continents, which is strikingly illustrated by Kamchatka (5,249) and Unalashka (3,510), situated respectively on the w. and e. coasts of the n. Pacific. South of the equator it rises from 0° to 18° very considerably, and more so on the w. than on the e. of the Cordilleras, owing to the small amount of rain and snow which falls on the w. of these mountains. It is as high in 33° s. lat. as in 19° n. lat.; but s. of this it sinks very rapidly, so that in the s. of Chili it is 6,000 ft. lower than in the same latitude in the Rocky mountains, and 3,000 lower than in western Europe. The mean temperature of the snow-line varies much from the equator to the pole—from 35° to 20° Fahr. In the Alps it is about 25°; and in Norway about 23°.

SNOW-SHOES, a species of shoe much used by the Esquimaux, Laplanders, and others who inhabit those regions where snow prevails for a great portion of the year. It consists of a flat frame, of a lanceolate form, from 8 to 14 in. in breadth at its widest part, and of great length—sometimes as much as 7, though generally about 4 feet. It is either wholly of wood or is a wooden frame filled in with wicker-work or thongs, and has cross-straps on the upper surface to attach it to the foot. The broad surface prevents the foot from sinking in the snow.

SNUFF. See **TOBACCO**.

SNYDER, a co. in central Penn., bordered by the Susquehanna river on the e., crossed by the Lewistown branch of the Pennsylvania railroad, drained by Penn's and Middle creeks; 300 sq.m.; pop. '80, 1797. The surface is mountainous and mostly covered with forests of oak, chestnut and hickory; the soil is fertile. The main productions are wheat, corn, hay, wool, clover seed, and lumber; cattle, sheep, and swine are raised. It contains large deposits of coal and iron. The Pennsylvania canal is on the e. border. It has manufactories of carriages and wagons, tanned and curried leather, also flour and saw mills. Co. seat, Middleburg.

SNYDERS, or SNEYDERS, FRANCIS, a Belgian artist, celebrated for his powers as an animal-painter, was b. at Antwerp in 1579, and was formed in the school of Henry van Baelen. Originally, he confined himself exclusively to painting fruits, and worked with Rubens. In his pictures, with figures by Rubens, Jordens, Honthorst, and Mierevelt, it is difficult to discover any difference of touch. For Philip III. of Spain he executed several hunting and battle pieces. Snyders knew how to give expression to the passions of the lower creation, and his bear, wolf, and boar fights are scarcely surpassable. The best specimens of the artist are contained in the galleries of Vienna, Munich, and Dresden, but there are also some fine pictures of his in private English collections. Snyders died at Antwerp in 1657.

SOAP (Lat. *sapo*(n), Welsh *sebon*—the Romans considered soap to be a Celtic invention). This well-known material, according to Pliny, first became known to the Romans by their conquest of Gaul. There are some notices of it in the English version of the Bible, but it is believed that the words *borith* and *nether*, there rendered into soap, really mean potash and soda.

The *chemical composition* of soap may be explained as follows: The fixed fatty bodies, stearine, palmitine, and oleine (we do not include margarine, for it is now generally admitted that the fat to which this name was applied is merely a mixture of stearine and palmitine), when heated with alkaline solutions, undergo the remarkable change known under the title *saponification*, or conversion into soap, during which process the fats yield up a clear viscid liquid, which, from its sweetness, is termed *glycerine* (q.v.). The nature of this change may be ascertained by decomposing the soap that is thus formed, and which exists as a homogeneous transparent mass, freely soluble in warm water, by the addition of some acid, such as tartaric or hydrochloric, which combines with the alkali, and forms a soluble compound with it. A fatty matter separates in flakes, which melt on the application of heat, and form an oily layer on the surface of the fluid. This substance, when cold, is found to be very different from the original fat. It has acquired a strongly acid reaction, as may be ascertained by applying test-paper to it in its melted state, and it is freely soluble in alcohol, the solution being strongly acid. It at once forms a clear solution in hot alkaline liquids, while the original fat would under similar conditions have formed a milky-looking fluid. It is, in fact, a true *acid*, capable of forming salts, the potash and soda salts being known as *soft-soap* and *hard-soap*, which have been thus generated out of the elements of the neutral fat under the influence of the alkali. Stearine, when thus treated, yields *stearic acid* (q.v.); palmitine yields *palmitic acid* (q.v.); and oleine, *oleic acid* (q.v.); while common fat, which is a mixture of the three above-named fats, affords, on saponification with an alkali, and subsequent decomposition of the soap, a mixture of the three fatty acids.

The term soap is sometimes extended in meaning, so as to include compounds of the fatty acids with other bases besides the alkalies, e.g., lime, baryta, magnesia, etc.; but these compounds being insoluble are inapplicable to the purpose of cleaning. The true soaps owe their cleaning power to their solubility, and their attraction for the matters that ordinarily constitute "dirtiness." The presence of a portion of free alkali increases the detergent power, especially in the case of greasy matter.

Manufacture.—In this country, and in the n. of Europe generally, hard-soap is made from tallow, palm-oil, bone grease, and kitchen fat, by boiling to saturation with caustic-soda. Cocoa, palm nut, and some other oils are occasionally used, chiefly in imitating superior soaps, and the only other ingredient of consequence is rosin, the residuum of the distillation of rough turpentine. In the s. of Europe, coarse olive-oil is the staple material, and from this is produced the marbled soap known as "Marseilles."

The soap-maker first dissolves in boiling water 6 to 8 cwt. of crude soda ash (see **SODA**) in a cast-iron circular vessel (contents may be 1000 gals.), furnished with a steam-pipe in its center. He then adds half the weight of *pure caustic* lime, and boils the mixture. When the lime has rendered the soda caustic, the boiling is discontinued, subsidence takes place, and the lye is ready for use.

Soap-pans are of various sizes. One of moderate dimensions may turn out from six

to eight tons, and is usually formed of four pieces of cast-iron—lower casting, say five feet in diameter; upper, eleven. Heat is applied either by means of a furnace beneath the bottom piece, or by open steam introduced by a pipe led to a circular perforated ring at the bottom of the pan. Steam boiling being now extensively adopted, our description will apply to that method.

Curd or White Soap.—20 cwt. of tallow being put into the soap-pan, and a quantity of the prepared lye, steam is turned on, and boiling continued until the lye is thoroughly incorporated with the tallow, and becomes a pasty mass. A few shovelfuls of common salt are now thrown in when the lye begins to separate. The partially formed soap is allowed to cool, and the salted lye, now deprived of its soda, subsides, and is drawn off from the bottom by a pipe, or removed by a pump. The operation of adding and boiling with lye is repeated until the tallow is saturated with soda, and the lyes show as much alkali after boiling as before. The soap is now treated with weaker lye, and by more or less water brought to the consistency the maker requires. From its tendency to thicken rapidly, it is transferred to the frame at a higher temperature than the soap next described.

Pale or Yellow Soap.—When the tallow is saponified as above described, about one-third of its weight of rosin is added, and the boilings with lye repeated, until the mass is thoroughly saponified. The practiced workman being aware that perfect soap is insoluble in strong alkali, avoids the risk of imperfect particles escaping the action of the lye from being enveloped in perfect soap, by reducing the mass with water, and adding lye gradually until the soap again floats as a curd on the liquid. The soap is then cooled down, and the lye being removed as completely as possible, it is boiled with the quantity of water necessary to bring it to the consistency required. These later operations require much experience, and the best theoretical knowledge requires the aid of tongue and eye to carry them through with success. The soap being now *finished* (the technical term), the copper is covered up, and the contents allowed to settle until the temperature falls to about 160° Fahrenheit. According to the quantity of water used, so is the deposit, called the *nigre*, greater or less. When too much water is used, the produce of soap is too small; when too little, the produce is large, but of inferior quality, from the insufficient deposit of impurities. This *nigre* is employed in making second class soap. When of proper temperature, the soap is removed, into frames, now mostly made of cast-iron, containing about 10½ cwt. each, where, after solidifying, which it does in three days, it is cut by wire into slabs, which are again cut transversely into bars ready for the market.

London mottled is made of kitchen fat (no rosin). The process described in the making of curd soap is followed here, except that when perfect the soap is, when almost boiling, put into wooden frames three or four times as high as the ordinary frame of 52 in., and the lye allowed to percolate through the soap to the lower part of the frame, producing the mottled appearance desired. As this soap, when subjected to any mixing operation, lost its *mottle*, it long enjoyed a high reputation as a genuine soap; but now that cheap imitations, having a beautifully marbled appearance, are produced from cocoa and palm nut oils, with coloring and siliceous matter, its prestige is somewhat on the wane.

The numerous patents taken out for improvements in soap-making have had for the most part more the object of cheapening, by the addition of various articles to soap in its semi fluid state, than of improving the manufacture.

Soft-soap differs from hard from having potash for its base instead of soda. The repeated changes of lye described in the manufacture of hard soap are here inadmissible, for all the lye employed remains in combination with the oily materials, and is never separated. Hence open steam, as throwing in water into the mass, cannot be applied, nor can salt, so useful an agent in the former manufacture, be used, as it would tend to separate the soap from the lye, while a thorough combination is essential. The making of soft-soap requires much experience and nicety, it being so easy to overdo the supply of alkali, which cannot happen in hard-soap. A ton of materials, consisting of 1900 lbs. of fish or other oil, with 340 lbs. tallow, is put into the soap-pan with 200 gallons of American potash lye of such strength that 6,600 grains of real potash are in each. After being boiled by the heat of a furnace, and well beat down on the surface to keep in bounds the frothy mass, a stronger lye, containing about 8,700 grains of potash per gallon, is added at short intervals, and the boiling carried on until the workman ascertains by taste and appearance that the soap is perfect. The tallow serves to give consistency to the soap, and also produces white specks of stearate of potash, which much enhance its appearance.

SOAP, MEDICAL USES OF. The only kind of soap that should be used internally is *white soda soap*. It is prepared from caustic soda and either olive or almond oil. In its purest state it is called *medicinal soap*, while in its less pure forms it is known as *Alicant*, *Venice*, or *Spanish soap*. When properly made, it should be perfectly soluble in pure water and in alcohol. It is chiefly employed to form pills of a gently aperient and antacid action. Pills containing a combination of soap and dried carbonate of soda are of great use in certain forms of gravel. Soap is often added to pills as an adjuvant, or for the purpose of preventing them from becoming hard and insoluble. White soap affords a ready antidote in cases of poisoning with the strong mineral acids. *Soft-soap* ought to

be made with olive oil and potash, and it should be of yellowish-white color, inodorous, and of the consistence of thick honey. It is of great service as an external application, either alone or in association with sulphuret of potash and other remedies, in various cutaneous affections.

SOAPBERRY, *Sapindus saponaria*, a West Indian tree of the natural order *sapindaceæ*, the pulp of the fruit of which is used instead of soap in washing. This property belongs to other species of the same genus. With the exception of *S. marginatus*, found in the southern states of North America the genus is entirely tropical. The use of the pulp as soap, if often repeated, is apt to injure linen; but it is capable of cleansing as much linen as sixty times its weight of soap. Each fruit contains a nut of a shining black color. These nuts are very hard, and were formerly imported into Europe to be made into waist-coat buttons, being tipped with silver or other metal. They were little liable either to be injured by wearing or to be broken.

SOAP-STONE. See **STEATITE**.

SOAP-TEST. This test, for which science is indebted to prof. Clark of Aberdeen, is now universally employed for determining the degree of hardness of water. Every one knows how much more readily a lather is formed—as, for example, in washing the hands—with soft than with hard water. This is accounted for by the earthy bases of the hard water displacing the alkaline bases of the soap, and forming compounds insoluble in water. This is the foundation of the soap-test. A hard water of known strength is first prepared by dissolving 16 grains of pure carbonate of lime in pure hydrochloric acid, evaporating to dryness, and dissolving the resulting chloride of calcium in a gallon of distilled water. This gallon of chloride of calcium solution accurately represents a natural water whose hardness is due to 16 grains of carbonate of lime in a gallon. A solution of soap in proof-spirit is next prepared of such strength as that a quantity of it which will fill 32 measures of a volumetric tube, each measure of which contains 10 grains, will be exactly able to convert 1000 grains' measure of the standard solution of hard water into the earthy soap described. This point is thus ascertained: The hard water is placed in a stoppered bottle, and the soap solution added to it by degrees, the bottle being shaken after each addition, when a bubble will form, which rapidly disappears so long as any lime is present; but when at last it is all used up, a froth of soap bubbles remains after hard shaking, such as to last unbroken for three minutes. If, now, a given sample of water be examined, and this point is reached at the expense of the entire 32 measures, it is a water of 16 degrees of hardness. Now, perfectly soft water consumes 2 measures of the soap solution before permanent bubbles are formed, so that a water of 16 degrees of hardness has in reality only consumed 30 measures of the soap solution. But $\frac{16}{30} = 0.53$;

hence, if any given measures of the soap-test be used in estimating the hardness of a water, we must first subtract 2 from the amount, and then multiply by 0.53; and the result will give us the degree of hardness. For example, let a given sample require 27 measures of the soap test. On subtracting 2 and multiplying by 0.53, we find its hardness to be 12.25. Clark's Soap-test Table for Hardness of Water is given in the article "Soap-test" in Knight's *English Cyclopædia*; and full details regarding the mode of working the test, to determine the amount of lime, magnesia, soda, sulphuric acid, and pure carbonic acid, are given in Dr. Parkes's *Manual of Practical Hygiene* (Lond. 1864).

SOAPWORT, *Saponaria*, a genus of plants of the natural order *caryophyllacæ*, having a cylindrical or ventricose 5-toothed calyx, without any outer calyx or attendant bractæa, five undivided petals with long claws, ten stamens, two stigmas, and a capsule opening at the top by four valves. Some of the species have very beautiful flowers. *S. calabrica* has of late become one of the most favorite annuals of our flower-gardens.—COMMON SOAPWORT (*S. officinalis*) is found on waysides, in thickets, and on the banks of streams, in most parts of Europe, although it is a somewhat doubtful native of Britain. Both the root and the leaves contain saponine (q.v.), in consequence of which they are sometimes employed for washing. The brownish-red color of the bark of the root, however, is apt to tinge white articles. The root of this plant has also medicinal properties, being aperient, resolvent, and alterative. It is sometimes sold as RED SOAP-ROOT.

Nearly allied to the genus *saponaria*, but having an angular calyx and a 5-valved capsule, is the genus *gypsophila*, some species of which are called SOAP-ROOT, and contain much saponin. Thus, the EGYPTIAN SOAP-ROOT (*G. struthium*), and the SPANISH SOAP-ROOT (*G. Hispanica*), called *Jabonera* in Spain, have been employed for washing from time immemorial, and the roots not having a dark rind can be used for washing white articles, and are to some extent an article of commerce, being used for silken and other stuffs, the colors of which will not bear the application of soap. The roots of *lychnis dioica*, one of the most common British plants, possess the same properties in an inferior degree.—The bark of *quillaja saponaria*, a Chilean tree of the natural order *Rosacææ*, contains much saponin, is generally used for washing in Chili and Peru, and there forms a considerable article of commerce.—Some of the tropical South Sea islands produce a species of vine (*Ritis saponaria*), the stem of which, especially the thicker part, cut into pieces, and softened by cooking on hot stones, produces in water a rich lather almost equal to that of soap. See also **SOLANUM**.

SOEBING is merely a modification of the ordinary movements of respiration excited by mental emotions. It is the consequence of a series of short convulsive contractions of the diaphragm, and is usually accompanied by a closure of the glottis, temporarily preventing the entrance of air into the lungs.

SOEBRAON, a village on the left bank of the Sutlej, 25 m. e.n.e. of Ferozpur, near which on Feb. 10, 1846, a most obstinate battle was fought between the British army of 15,000 men, under sir Hugh Gough, and a Sikh force numbering 30,000. The Sikhs were strongly intrenched, and vigorously resisted the attacks of their opponents, but the courage and perseverance of the latter ultimately gave them the mastery; the various earthworks were captured in succession, and the Sikhs driven across the Sutlej, with a loss in killed, wounded, and drowned of 13,000. Gough immediately followed up his victory by crossing into the Punjab in pursuit of the fleeing enemy.

SOCAGE, or **SOCAGE** (originally *hlaford-soen*, seeking a lord; whence we have also *soe*, a right of holding a court), a tenure of lands in England, of which the characteristic feature is, that the service is fixed and determinate in quality, thereby differing both from knight-service and from villeinage. It was originally peculiar to the Anglo-Danish districts of England. At the time when the allodial tenure was converted into immediate dependence on the crown, this tenure seems to have arisen out of the necessity for commendation or seeking a lord. In Domesday, soemen are often mentioned as bound "to seek a lord," or free to go with their land where they pleased. The soemen of Stamford are said to be free to seek a lord, being only liable to the king for the toll attached to them as inhabitants of a borough. The obligation of socage in its origin has been compared to the mutual bonds of allegiance of later times so common in the highlands of Scotland, and known as bonds of manrent (see **MANRENT**). Three kinds of socage have been enumerated as existing at a later period—viz., free and common socage, socage in ancient tenure, and socage in base tenure. The second and third kind are equivalent to tenure in ancient demesne and copyhold tenure (see **DEMESNE**, **ANCIENT** and **COPYHOLD**), and the first is what has generally and more properly been denominated socage, where the services were both certain and honorable. Besides fealty, which the socager was bound to do when required, he was obliged to give attendance at the court baron of his lord, if he held one, either for a manor or for a seignior in gross.

By an act passed during the commonwealth, and confirmed after the restoration by 12 Car. II. c. 24, tenure by knight-service was abolished, and all lands except church-lands held in free alms, were directed to be held in free and common socage, which is now (with that exception) the universal tenure of real property in England and Ireland.

Socage tenures are unknown in Scotland, where, unless at a very early period, they never existed.

SOCIALISM, the name given to a class of opinions opposed to the present organization of society, and which seeks to introduce a new distribution of property and labor, in which organized *co-operation* rather than *competition* should be the dominating principle, under the conviction that the happiness of the race, and especially of the classes without capital, would be benefited thereby. Historically considered, socialism, like many of the significant phenomena of our age, is a product of the French revolution. That terrible outburst of popular discontent is most properly regarded as an anarchic attack on the social system that had its roots in the feudalism of the middle ages. The furious hatred of the court and the aristocracy, the passionate love of the "people," of "humanity," of "liberty," though called forth by special circumstances, and never formally worked out into a theory of social life, virtually contained in themselves the germs of all later proposed organizations. In the middle ages, the *right* of freely and fully enjoying life, property, and political independence was limited to a favored few; while the great masses were condemned to dumb servitude, and a perpetual minority. Even the industrial population did not recognize the socialistic idea. The members of the different guilds or fraternities claimed exclusive right to exercise certain branches of industry, and probably the great majority of the inhabitants of a town remained in a disregarded and dependent state. Amid such social conditions, resting, as they did, on a belief in the necessity of different distinct ranks, the free action of individual life, and even the vital progress of the whole community, became well-nigh impossible. We have not space here to trace the course of the various minor reforms that weakened the authority of the mediæval theory of life; but we must not omit to notice the speculations of the political philosophers of the 18th c. in France, England, and Germany, as operating powerfully in favor of a new social system, in which the idea of humanity (assuming, at the French revolution, as we have observed, the concrete form of the "people") stands out prominently. Nevertheless, the first shape that the modern spirit of industry took was not socialistic, in the strict and proper sense of the term; it was rather individualistic, and found, as it still finds—for it is yet the prevailing theory—its natural expression in such proverbs as, "A fair field, and no favor;" "Every one for himself, and God for us all." But still, even this lawless individualism is to be regarded as a protest against the false *class*-legislation of preceding times, and as an assertion of the absolute right of *each member of society* to a share in the general welfare. That it has not universally commended itself to civilized mankind as a perfect system, is demonstrated by the appearance and temporary popularity of such schemes of society as those of Owen (q.v.), Fou-

riër (q. v.), St. Simon (q. v.), and the enthusiasm excited at intervals in different parts of Europe by the promulgation of extreme communistic opinions. See COMMUNISM. It is objected to socialism, under its various forms, that it makes human happiness too much dependent on material gratifications; that it robs man of that energy that springs from ambition; that it unphilosophically ignores an individualism and inequality to which nature herself has given her inviolable sanction; and that, by the abolition of social rewards and punishments, it neither holds out any hope to the industrious, nor excites any apprehension among the indolent. On the other hand, we must admit that the vigorous assertion of socialistic principles has led men to a more liberal and generous view of humanity as a whole. Moreover, it has forcibly called public attention to numerous evils that have sprung up along with the modern development of industry, for which no remedy—not even a name—had been provided; to the vital interdependence of all classes; and to the inadequacy of the individual or “selfish” system, as it has been called, to redress the wrongs or cure the evils that inevitably spring from its own unchecked operation. The recent spread of socialistic opinions in Germany, taken in connection with the two attempts made on the life of the emperor, has led, in 1878, to special and stringent legislation designed to check the growth of socialism. In 1878 it was computed that there were in Germany 75 socialistic publications, with 135,000 regular subscribers. See COMMUNISM.

SOCIAL SCIENCE, a name that has of late years been given to the study of all that relates to the social improvement of the community. A society called “the national association for the promotion of social science” was first organized at a meeting which was held under Lord Brougham’s auspices in July, 1857, to consider the best means of uniting together all those interested in social improvement. The annual meetings have been held each year at a different place. The association as now constituted comprises five sections—1. Jurisprudence and amendment of the law (sub-section, repression of crime); 2. Education; 3. Health; 4. Economy and Trade; 5. Art. The association aims at promoting improvement in all matters falling within these departments, by means of bringing together, for free discussion, societies and individuals interested in social problems.

SOCIOLOGY is the somewhat barbarous name that has of late been used to denote the study of the origin, organization, and development of human society.

SOCIAL WARS—wars with *socii* or allies. The most important social war was between Rome and the Italian peoples, such as the Samnites, Peligni, Marsi, etc., who desired to be admitted to the rights of citizenship. M. Livius Drusus, who had been the advocate of the Italian nationalities, was assassinated B.C. 91. The Italian allies of Rome at once revolted, and the three years’ war that followed—during which over 300,000 men are said to have lost their lives—though the Romans, under Marius and Sulla, inflicted terrible losses upon the allies, was substantially a victory for the latter, who eventually were granted the rights demanded. Athens had two social wars, the first with the allied cities of Cos, Chios, and Byzantium, whose independence was secured B.C. 357–55; the second between Athens and the Ætolian and Achaean leagues B.C. 220–17.

SOCIETIES are associations of individuals for the promotion or accomplishment of some particular object. Such objects are numerous, including the promotion and investigation of almost every well-recognized branch of science, art, and literature; the diffusion of knowledge, religion, and morality; intercourse between those of the same profession or trade; the removal of legal grievances; mutual aid in case of distress; and an abundance of other aims, which are either beneficial to the general public or to the members of the society alone. In Great Britain any number of persons may agree to constitute themselves a society if the object of their union is legal. Those whose objects are scientific or literary are occasionally called *academies* (q. v.), and under this or their own special names will be found notices of the chief societies at present existing. “Secret” societies for the accomplishment of some object which involves a subversion of existing political arrangements, spring up from time to time in France, Ireland, Italy, etc.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE. A society formed in 1698 in the English church, having for its object Christian education in England and Wales, and the spread of the Bible in the colonies. The originator of it was a clergyman, Dr. Thomas Bray. In 1709 this society aided the Danish mission at Tranquebar. The Tanjore mission in 1726, and that at Trichinopoly in 1762, where Schwartz labored, were sustained by it. After the organization of other societies for the express purpose of propagating the gospel in foreign lands this society confined itself to the circulation of Bibles, tracts, prayer-books, etc. It has branch societies in various parts of Great Britain.

SOCIETY ISLANDS, a small archipelago in the South Pacific ocean, in lat 16° to 18° s., long. 148° to 155° w., is formed of a number of islands, of which the greater number are under French rule. Exclusive of islets, the group is formed of 13 islands—Tahiti or Otaheite, Maïtia, Eimeo, Maïaoiti, Tetuaroa, Otaha, Marua, Tuba, Lord Howe’s island, Scilly island, Huahine, Raiatea, and Borabora. The three last, with their dependencies, are not under the French protectorate, but are each an independent state. Area esti-

mated at 580 sq. m.; pop. about 20,000. All the islands closely resemble each other in appearance. They are mountainous in the interior, with tracts of low-lying and extraordinarily fertile land occupying the shores all round from the base of the mountains to the sea. They are surrounded by coral reefs, are abundantly watered by streams, and enjoy a temperate and agreeable climate. Almost every tropical vegetable and fruit known is grown here, but agriculture is in a backward state. The animals are those usually found in the South Sea islands. The inhabitants belong to the Malay race, are affable, ingenious, and hospitable, but volatile and sensual. The practice of tattooing has almost wholly disappeared, and the native costume now closely resembles that of civilized nations. There are now no native manufactures, these having been entirely superseded by imported goods. Cocoa-nut oil, oranges, lime-juice, kauri shells, and pearl shells are the principal articles exported; and cocoa-nuts are the general article of barter throughout the islands for calicoes, cotton cloth, knives, cordage, groceries, etc., which are imported chiefly from Tahiti. The exports from Tahiti, the principal island, amounted in 1871 to £110,000, and the imports to £120,000.

Tahiti is said to have been visited as early as 1606. Capt. Cook reached it in 1769, and discovered many of the other islands of the archipelago, to which he gave the name of Society islands in honor of the Royal society of London. In 1797 the first mission-ship fitted out by the newly formed London missionary society arrived at Tahiti. After 19 years of apparently fruitless labor the influence of the missionaries began to be felt, and soon afterward became so powerful as to be almost paramount. A quarrel between the Protestant and Roman Catholic missionaries, who thought it better to enter upon ground already occupied by Protestants than to take up new ground for themselves, occasioned the interference of France in favor of the latter, and the island of Tahiti was taken possession of in the name of Louis Philippe by a strong French force in 1844. All the possessions of the native ruler—who, however, still enjoys nominal authority—were afterward placed under the protection of France, and the Society islands, though still nominally a protected state, may be considered as virtually a French colonial possession. Many of the Protestant missionaries left the island in consequence of the interference of the French authorities with their labors. Some, however, remained, and the congregations continued to meet. An application to the British government procured a concession on the part of the French government of some of the rights of religious liberty, which had been taken away by the local authorities.

SOCINUS, the name of two celebrated heresiarchs, uncle and nephew, who have given name to a sect of Christians, the Socinians, better known, however, as Unitarians (q.v.). —**LÆLIUS SOCINUS**, the elder of the two, was b. at Sienna, in Tuscany, in 1525, and belonged to a family that had long been distinguished for its cultivation of literature and science. His father, Marianus Socinus, was an able lawyer, and designed his son for the same profession. But Lælius soon displayed a strong preference for theological inquiry, and in order to better prosecute his biblical studies he made himself familiar with Greek, Hebrew, and Arabic. The only result of his legal training that one can discern is an obstinate aversion to believe anything "unreasonable." The principles of the reformation had slowly found their way into Italy, and in 1546 a secret society was formed at Vicenza for the discussion of religious questions. It was composed of 40 persons, distinguished by their rank, their occupations, and their titles. Socinus was admitted a member. The conclusions at which they arrived were unfavorable to the dogma of the Trinity, which they held to have been borrowed by the early church from the speculations of Greek philosophers. The purpose of their meetings together having been discovered, the society broke up. Some of the members were arrested and put to death, others sought safety in flight. Among the latter was Socinus, who traveled in France, England, Holland, Germany, and Poland, making the acquaintance, and acquiring the esteem, of many transalpine scholars, and finally settled in Zürich, where he died in 1562, when only 37 years of age. Lælius Socinus, unlike most heretics, was a prudent and reticent man. His speech at least never betrayed him; but in his correspondence with his Italian relatives and friends he showed himself an ardent and eloquent disputant, and made not a few proselytes. Once, in a moment of mistaken confidence, he disclosed himself to Calvin, who grimly warned him to get rid of his "itch of inquiry," lest he should "draw on himself great torments." In the same year occurred the murder of Servetus.—See Ilgen's *Vita Lælii Socini* (Leip. 1814), and *Symbolæ ad Vitam et Doctrinam Lælii Socini* (Leip. 1826).

SOCINUS, FAUSTUS, nephew of the preceding, was the son of Alessandro Socinus, and was also born at Sienna, Dec. 5, 1539. By the mother's side he was very highly connected, but having lost his parents while still young, his education was carelessly conducted; and he himself, at a later period, lamented the imperfection of his scholastic culture. His want of learning, however, only induced him to speculate the more freely, and thus it happened, partly from native bias, and partly from his uncle's epistolary arguments, that Faustus was a heretic and anti-Trinitarian before he was out of his teens. In 1559, when only 20 years of age, he found it advisable to seek an asylum in France, and was living at Lyon when he got news of his uncle's death. He immediately proceeded to Zürich, and possessed himself of his relative's MSS., after which he returned to Italy. He entered the service of the grand duke of Tuscany, and during twelve years

seemed to forget, amid the cares of office and the dissipations of a court, the thorny questions of theology. But at the expiry of that period, he was seized with a stronger desire than ever to investigate the truths of religion, and in spite of all remonstrances, proceeded to Germany—the center of theological activity. In 1574 he retired to Basel, to prosecute his studies more closely; but a disputation which he had with a certain Fr. Pucci (1578), obliged him to leave Switzerland. At the request of George Blandrata, he visited Transylvania, where anti-Trinitarians were numerous, especially among the nobles, and eagerly sought (not without success) to make converts to his opinions. In 1579 he went to Poland. Anti-Trinitarianism was even stronger there than in Transylvania, and Socinus soon obtained a great influence. He preached, and disputed, and wrote with a zeal that Socinianism has seldom displayed since. His position in relation to the reformers was, that Luther and Calvin had rendered great services to the cause of religion, but that they had not gone far enough, that the only solid basis on which Protestantism could rest was human "reason," that everything that contradicted it should be rejected as false and incredible, and that dogmas that were absurd should not be allowed to shelter themselves from criticism because their defenders chose to call them "mysteries." The Protestants were alarmed, and the ablest among them undertook publicly to confute Socinus. A disputation was held in the college of Posna, which ended in Socinus reducing all his opponents to silence; but they retaliated (after the unscrupulous fashion of the times) by trumping up against their vanquisher a charge of sedition, which, although ridiculously groundless, made it necessary for Socinus to withdraw from Cracow. While living in retirement on the estate of a Polish noble, Christopher Morsztyn, he married the daughter of his protector. She seems to have been a tender and affectionate wife; and when Socinus lost her in 1587, he almost broke his heart through grief. About this period his property in Italy was confiscated; but he had powerful and wealthy friends in Poland, who proved generous to him in his needs. In 1588 he took part in the synod of Brest (on the borders of Lithuania), and combated all the principal dogmas of the church—the divinity of Christ, propitiatory sacrifice, original sin, human depravity, the servitude of the will, and justification by faith. In 1598, on the publication of his *De Jesu Christo Servatore*, his enemies stirred up the populace of Cracow against him; and Socinus was pulled from a sick-bed, and nearly murdered. Soon after, he left the city, and found a refuge with one of his friends in the village of Lucлавie, where he died, Mar. 3, 1604. Socinus's works are no longer read; but his opinions have never wanted advocates in any Protestant country. He and his uncle may be regarded as precursors of that spirit of rationalism which has rooted itself so deeply in the thought of the modern world. See Przypcow's *Life of Socinus*, prefixed to a collection of his works in the *Bib. Frat. Polonorum* (Amst. 1656); Bayle's article in the *Dictionnaire*; and Toulmin's *Memoirs of the Life, Character, etc. of F. S.* (Lond. 1777).

SOCLE, a plain plinth, forming a pedestal for the support of a statue, column, etc.

SOCORRO, a co. in central New Mexico, having the state line of Arizona for its w. boundary, and that of Texas for its eastern; 11,500 sq. m.; pop. '70, 6,603—6,384 of American birth. It is drained by the Rio Grande del Norte, the Pecos, and the headwaters of the Gila. The surface is mountainous, crossed by a range of the Zuni mountains, the Sierra Blanco, and other spurs. A large proportion is unproductive, but the river banks and localities improved by irrigation produce wheat and corn. Much attention is paid to vine-culture and sheep-raising. Its mineral products are gold and iron. Co. seat, Socorro.

SOCOTRA, an island near the entrance to the gulf of Aden, 80 m. long and 30 broad. Area upward of 1000 sq. miles. Pop. 5,000, of various races. The surface consists for the most part of a table-land of from 700 to 800 ft. high, and low plains skirt the northern and southern shores. All the streams of the island, with the exception of a few rivulets, are dry at a certain season; but rain-water is collected in reservoirs, and in most parts water can be obtained by digging a few feet below the surface. Owing to the somewhat unfertile character of the soil, most of the districts are more adapted for pasture than for agriculture; but grain, fruits, and vegetables are grown in the eastern districts. The aloe plant and the dragon's-blood tree are the chief commercial products. Socotra belongs to the sultan of Keshin, who in 1876 concluded a treaty by which in respect of Socotra, he becomes a feudatory of Great Britain.

SOCRATES, the celebrated Greek philosopher, was b. at Athens in the year 469 B.C. His father, Sophroniskos, was a sculptor; and he followed the same profession in the early part of his life. His mother, Phaenarete, was a midwife, to which avocation he was wont to compare his own peculiar method of conversational teaching. His family was respectable in descent, but humble in point of means. His physical constitution was robust to an extraordinary degree, enabling him to endure the hardest military service, and to live his own chosen life of superiority to all wants above the barest necessities of life. While his ordinary diet was simple and abstemious, he could, on religious festivals or social occasions, drink more wine than any one else without being intoxicated. He had the usual education of an Athenian citizen, which included not only a knowledge of the mother-tongue, and readings in the Greek poets, but also the elements of arithmetic, geometry and astronomy, as then known. As a young man, he frequented the society of the physical philosopher, Archelaus (a disciple of Anaxagoras);

but the philosophers that did most to determine his own special turn of mind must have been Parmenides and "the double-tongued and all-objecting Zeno."

Excepting in connection with his philosophical career, few circumstances of his life are known. He served as a hoplite, or heavy-armed foot soldier, at the siege of Potidaea, at the battle of Delium, and at Amphipolis, and his bravery and endurance were greatly extolled by his friends. On two memorable occasions, he stood forward in political life. After the battle of Arginusæ, in 406, the ten generals in command were publicly arraigned for neglecting to obtain the bodies of the killed to receive the rites of interment. The clamor for their condemnation was so great, that the court wished to proceed in violation of the legal forms; but Socrates, as the presiding judge, firmly refused to put the question. The other occasion was during the tyranny of the Thirty, who took up the policy of compelling a number of influential citizens to take a part in their illegal murders and confiscations; but Socrates withstood them at the peril of his own life.

Somewhere about the middle period of his life, he relinquished his profession as a statuary, and gave himself up to the career that made him famous. D deservedly styled a philosopher, he neither secluded himself for study, nor opened a school for the regular instruction of pupils. He disclaimed the appellation of teacher; his practice was to talk or converse, "to prattle without end," as his enemies said. "Early in the morning, he frequented the public walks, the gymnasium for bodily training, and the schools where youths were receiving instruction; he was to be seen in the market-place at the hour when it was most crowded, among the booths and tables where goods were exposed for sale. His whole day was usually spent in this public manner. He talked with any one, young or old, rich or poor, that sought to address him, and in the hearing of all who chose to stand by. He visited all persons of interest in the city, male or female; his friendship with Aspasia is well known; and one of the most interesting chapters of Xenophon's *Memorabilia* recounts his visit to and dialogue with Theodotê—a beautiful *hetæra*, or female companion. Nothing could be more public, perpetual, and indiscriminate as to persons than his conversation; and as it was engaging, curious, and instructive to hear, certain persons made it their habit to attend him in public as companions and listeners. These men, a fluctuating body, were commonly known as his disciples or scholars, though neither he nor his personal friends ever employed the terms *teacher*, and *disciple* to describe the relation between them."—Grote's *Greece*, chap. lxviii.

Another peculiarity of Socrates was his persuasion of a special religious mission. He had been accustomed all his life to hear what he considered a divine voice, or preternatural sign, which came to him solely as a prohibition or warning, and never as an instigation to act. In deference to it, he had kept back from entering public life, and it caused him to refrain from premeditating the defense that he made on his trial. Nor was this all; relying, like his countrymen, on divine intimations by dreams and oracles, he believed that his mission had been signified to him by these. One oracular intimation in particular he described in his defense as the turning-point of his life. An admirer and friend of his, Chærephon, about the time when he began to have some repute as a wise man, consulted the oracle at Delphi as to whether any man was wiser than Socrates. The priestess replied: "None." The answer, he said, perplexed him very much; for he was conscious to himself that he possessed no wisdom on any subject, great or small. At length, he resolved to put the matter to the test by taking measure of the wisdom of other persons as compared with his own. Selecting a leading politician, accounted wise by himself and by others, he put a series of questions to him, and found his supposed wisdom was no wisdom at all. He next tried to demonstrate to the politician himself how much he was deficient; but found him impracticable on this head, refusing to be convinced. He then saw a meaning in the oracle, to the effect that his superiority to others lay not in his wisdom, but in his being fully conscious of his ignorance. He tried the same experiment on other politicians and rhetors, then on poets, and lastly on artists and artisans, and with the same result. Thereupon, he considered it as a duty imposed upon him by the Delphian god to cross-question men of all degrees as to their knowledge, to make them conscious of their ignorance, and thereby put them in the way of becoming wise. We shall see presently wherein this low view of the human intelligence differed from the contemptuous tone of a mere satirist.

The intellectual characteristics of Socrates, through which he influenced the whole subsequent course of human thought, may be stated under three heads: 1. Subject, 2. Method, and 3. Doctrine.

1. As to subject.—Here he effected a signal revolution, metaphorically expressed by the saying of Cicero, that "Socrates brought down philosophy from the heavens to the earth." The previous philosophies consisted of vast and vague speculations on nature as a whole, blending together cosmogony, astronomy, geometry, physics, metaphysics, etc. Socrates had studied these systems, and they left on his mind a feeling of emptiness and unsuitability for any human purpose. It seemed to him that men's endeavors after knowledge would be better directed to the human relationships, as involving men's practical concerns. He could not go to any public assemblage without hearing questions agitated respecting the just and unjust, the honorable and base, the expedient and hurtful; moreover, he found that the opposing disputants were, without knowing it, very confused in their ideas as to the meanings of those large words in which the weightiest interests centered. Accordingly, he was the first to proclaim that "the proper

study of mankind is man;" human nature, human duties, and human happiness made up a field of really urgent and profitable inquiry. In astronomy he saw a certain utility for navigation, and for the reckoning of time, to which extent he would have it known by pilots and watchmen; geometry was useful in its literal sense of land-measuring; arithmetic he allowed in like manner so far as practically useful; but general physics, or the speculations of philosophers, from Thales downward, as to the origin of all things out of water, fire, air, etc., he wholly repudiated. "Do these inquirers," he asked, think that they already know *human* affairs well enough, that they thus begin to meddle with divine? Do they think that they shall be able to excite or calm the winds at pleasure, or have they no other view than to gratify an idle curiosity?" He considered it not only unprofitable but impious to attempt to comprehend that department. The gods, he thought, managed all those things after their own fashion, and refused to submit them to invariable laws of sequence, such as men might discover by dint of study; the only means of knowledge permitted was religious sacrifice and prayer, and the consultation of the oracles. While this was the appointed way in reference to divine things, it was equally appointed that human things should be learned by diligence in study and investigation.

2 In regard to method, Socrates was the author of still greater innovations. It was to little purpose that men applied themselves to human affairs, if they conceived them loosely, and with no regard to evidence. Socrates introduced at least one element of logical precision into the handling of questions, by insisting on accuracy in definition and classification. His mode will be seen in the statement of Xenophon. "Socrates continued incessantly discussing *human* affairs, investigating—What is piety? What is impiety? What is the honorable and the base? What is the just and the unjust? Men that knew these matters, he accounted good and honorable; men that were ignorant of them, he assimilated to slaves."

His investigation thus took the form of ascertaining the exact meaning—that is, the definition—of the leading terms in ethics and in politics, the settling of what J. S. Mill calls the *connotation* of a general word, which determines how to apply it rightly to each individual case. The very idea of defining a general term, now so obvious, never seems to have suggested itself to any one previous to Socrates. And his manner of seeking out those definitions is also characteristic, and links itself to his conversational method, and his convicting men in general of ignorance in things that they thought they knew. Professing himself to be able to furnish no exact definition (this professed ignorance was called the Socratic irony) of justice, temperance, courage, etc., and finding every one else quite confident in their ability to supply the want, he asked some one to state his definition; and on its being given, he put a few further interrogations (as he said) by way of making sure that he understood the meaning, but with the speedy effect of driving the respondent into a humiliating self-contradiction. His method is most fully exemplified in certain of the Platonic dialogues, as the first *Alcibiades*, *Laches*, *Charmides*, *Euthyphron*, etc. According to Xenophon, he could pass from his severe cross-examining method, with its humiliating shock of convicted ignorance, and address to his hearers plain and homely precepts, inculcating self-control, temperance, piety, duty to parents, brotherly love, fidelity in friendship, diligence, etc.—such direct admonitory influence being common to him with the so-called sophists. He probably went beyond the ordinary teaching of the sophists in exhorting men "to limit their external wants, to be sparing in indulgence, and to cultivate, even in preference to honors and advancement, the pleasures arising from a performance of duty, as well as from self-examination and the consciousness of internal improvement." This strain of exhortation, his manner of life in harmony therewith, and the virtual self-immolation of his death, may be considered as the conjoint root of the cynic and the stoic philosophers.

As regards doctrine, Socrates was distinguished chiefly by his theory of virtue. Virtue, he said, consisted in knowledge. To do right, was the only road to happiness; and as every man sought to be happy, vice could arise only from ignorance or mistake as to the means; hence the proper corrective was an enlarged teaching of the consequences of actions.

We cannot, on any fair interpretation of knowledge, regard this as other than a one-sided view. It takes note of one condition of virtue, since there can be no right conduct without understanding the tendency of actions, or, at all events, the meaning of rules; but it omits, what is also essential, the state of the emotions or dispositions, which may be directed either to exclusively self-regarding ends, or to ends involving also the good of others. There is an obvious connection between the doctrine and the Socratic analogy of virtue to the professions. The virtue of an artisan is almost exclusively contained in his skill or knowledge; his dispositions can usually, though not always, be depended on, through the pressure of his immediate self interest. But the practice of Socrates was larger than his theory; for, as already remarked, his exhortations were addressed to men's feelings or sentiments as well as to their intellect. His political doctrines were biased by the same analogy of special professions. The legitimate king or governor was he alone that knew how to govern well.

In the year 399 B.C., an indictment was laid against Socrates, in the following terms: "Socrates is guilty of crime: first, for not worshipping the gods whom the city worships, and for introducing new divinities of his own; next, for corrupting the youth. The

penalty due is death." The trial took place before a dikastery, or law-court, composed of citizen-judges, like our juries, but far more numerous; the number present seems to have been 557. His defense is preserved by Plato, under the title *Apology of Socrates*. The tone of it, so admirable to us, was such as to make acquittal all but impossible, from the number of enemies created by his cross-questioning annoyance of all classes of men, and from various other causes. He dwelt on his mission to convict men of ignorance for their ultimate benefit; pronounced himself a public blessing to the Athenians; declared that, if his life was preserved, he would continue in the same course; and regarded the prospect of death with utter indifference. By a majority of either five or six, the charges were declared to be proven. A vote had then to be taken on the sentence. By the Athenian practice, the accuser named a penalty, and the accused was asked to do the same; the judges were restricted to one or other of these. The accuser named death. Socrates, maintaining the same high tone, declared at first that he deserved the highest public reward; but, on the instigation of his friends, he ended by proposing a trifling fine. The court, by a majority, decided for the capital sentence. There was an accidental interval of 30 days before the execution, during which Socrates in prison conversed with his friends as usual; on the last day occurred his conversation on the immortality of the soul, referred to in the Platonic dialogue called *Phædon*. He then drank the hemlock, and passed away with the dignity and calmness becoming his past life.

"There can be no doubt," says Mr. Grote, "that the individual influence of Socrates permanently enlarged the horizon, improved the method, and multiplied the ascendant minds of the Grecian speculative world, in a manner never since paralleled. Subsequent philosophers may have had a more elaborate doctrine, and a larger number of disciples who imbibed their ideas; but none of them applied the same stimulating method with the same efficacy; none of them struck out of other minds that fire which sets light to original thought; none of them either produced in others the pains of intellectual pregnancy, or extracted from others the fresh and unborrowed offspring of a really parturient mind."—See Grote's *Greece*; Zeller's *Philos. der Griechen*.

SODA. See **SODIUM**.

SODA, MANUFACTURE OF. Soda, or, more correctly, carbonate of soda, occupies the chief place among our leading chemical manufactures, alike from its own importance, and also on account of its influence on other great chemical industries, such as glass-making, soap-making, bleaching, etc.

A native carbonate of soda, or rather a sesqui-carbonate, called natron (q.v.), is found in Egypt and some other parts of the world. In Hungary, several manufactories exist for the purification of a native soda found there. Formerly, most of the soda in use was extracted from certain plants; and two kinds were known in commerce under the names of barilla (q.v.) and kelp (q.v.).

But the quantity of soda got from all other sources is now insignificant in comparison with that manufactured from common salt (chloride of sodium—see **SODIUM**). The process was invented by a Frenchman named Leblanc, and was first made known to the world by a commission of the French republic in 1794, although dating some years earlier. It is unquestionably the most valuable discovery in the entire range of chemical manufactures; and it has been practiced for nearly ninety years without any important alteration. It is sad to think that the author of this invention reaped no benefit from it himself, but spent the last of his days in an hospital, "a wreck in fortune, health, and hope." Owing partly to the war between France and England, and partly also to the existence of a duty of £30 per ton on common salt, which continued for eight years after the close of the war, Leblanc's process was not adopted in Great Britain except on a very limited scale till 1823. After the repeal of the tax in that year, Mr. James Muspratt erected his celebrated works at Liverpool, adopted the process in its entirety, and succeeded, after overcoming many difficulties, in establishing in Great Britain a chemical manufacture which has since become the most important in the world, and for which nearly 600,000 tons of common salt are now annually required.

The object of the soda-process is to separate the sodium of the salt, and unite it with oxygen to form caustic soda, or, what is more generally done, to unite the sodium with both oxygen and carbonic acid to form carbonate of soda. The several stages of the process are as follows:

First Operation—The Production of Sulphate of Soda.—The decomposition of the common salt is effected by treating it with sulphuric acid, which transforms it into sulphate of soda and hydrochloric acid. This operation was long conducted in a common reverberatory furnace (q.v.), and the hydrochloric acid was suffered to escape into the air. Not only was the acid thus lost, but it destroyed all vegetation in the neighborhood of soda-works, and involved their owners in serious law-suits for damages. The great chimneys of the St. Rollox works, Glasgow, and Mr. Muspratt's, Liverpool, which are nearly 500 ft. high, were erected with a view of curing this evil, but they were found to be ineffectual. The most improved furnaces now in use for the purpose are built in pairs, and in the front part of each there is a shallow cast-iron pan, nine ft. in diameter, with a sheet-iron cover, and so built that the fire may act on the bottoms and sides. Behind this, an oblong brick-

chamber, 30 ft. by 9 ft., is situated, with separate fire-places, and called the salt-cake furnace. Acid flues are led from each compartment of the double furnace into one main flue, which has its outlet into a condensing tower, to be presently described. Separate flues are also provided for the conveyance of smoke to a main chimney. The furnace is worked in the following way: when it is properly heated, salt to the amount of 10 cwt. is thrown in by an opening, and about 80 gallons of strong sulphuric acid are heated and run in. The mixture, which is well stirred with an iron rake, gradually thickens, and in about an hour the pasty mass, not yet all decomposed, is pushed through the opening into the salt-cake chamber. Here it is spread out on the sole, and maintained at a red heat for another hour, when the whole of the hydrochloric acid is expelled, and the conversion into sulphate of soda complete. A pair of furnaces, about one-half larger than those above described, will produce about 19 tons of sulphate of soda in a day, for which 16 tons of common salt are required. At the St. Rollox chemical works, Glasgow, about 500 tons of common salt are decomposed weekly.

A very important part of this operation is the condensation of the hydrochloric acid gas, which is disengaged in large volumes during the decomposition of the salt. As already stated, it was formerly allowed to escape into the atmosphere. The acid flues convey it to the condensing towers, which are generally filled with pieces of burnt coke, through which a supply of water is kept running. The gas enters at the bottom of the first tower, passes upward, and descends the second, and is gradually absorbed by the water, forming strong liquid acid, which is run out by openings at the bottom of the condenser. So perfect is the system of condensation now in use at some works, that of the acid produced by 100 tons of pure chloride of sodium which should yield 62 tons, as much as 58½ tons have actually been collected; and it has been instanced, as a curious illustration of this in another way, that Mr. Muspratt's great works, which were at one time forced out of Liverpool as a nuisance, have been established there again without causing any protest. Nevertheless such works being still considered obnoxious to their neighbors, an "alkali act" was passed by parliament in July, 1863, "For the more effectual condensation of muriatic (hydrochloric) acid gas in alkali works." It compels every manufacturer of alkali to secure the condensation of not less than 95 per cent of the muriatic gas evolved in his works, under a penalty not exceeding £50. This act was amended in 1874 by which copper and sulphuric acid works were placed under similar restrictions. The hydrochloric acid obtained in this process is mostly used in the manufacture of bleaching-powder.

Second Operation—The Conversion of the Sulphate of Soda into Black ash, called also Ball-soda.—This is effected by heating a mixture of sulphate of soda, carbonate of lime, and coal, in a reverberatory furnace. The proportions now used are the same as those first recommended by Leblanc—viz., sulphate of soda, 100 parts; carbonate of lime, 100 parts; carbon (charcoal), 55 parts. But as coal is employed in England instead of charcoal, the quantity used is generally 75 to 100 of each of the other two ingredients. The "balling furnace" used in this operation has two beds, the one being raised a few inches above the other. The waste heat from the fire-place is usually employed in boiling down the soda-lye. The charge is thrown into the bed of the balling furnace away from the fire-place after it has been raised to a bright red heat, and remains till it becomes sufficiently heated throughout the whole mass. It is then transferred to the *flaring bed*, which is next the fire, and exposed to a higher heat, when it shortly begins to soften and flux into a mass like dough. In about half an hour the charge is withdrawn in a red-hot state by the working door, and received into iron barrows, where it solidifies into blocks of crude soda termed ball-soda, or black-ash. A new kind of balling furnace, first introduced at the Jarrow Chemical works, South Shields, is now becoming extensively used. It differs from the one described in having that portion of it for receiving the mixture of sulphate of soda, coal, and lime in the form of a brick-lined iron cylinder, large enough in some instances to decompose 50 tons of the sulphate in 24 hours. This cylinder lies in a horizontal position, and is made to revolve slowly by engine-power. The materials are introduced by means of a hopper; the fire-place, which does not rotate, is placed at one end of the cylinder; and the arrangement for evaporating the lye is somewhat similar to that employed in the furnace described. This rotary furnace admits of the work being much better done than by the older reverberatory furnace, as it not only saves labor, but prevents loss of soda by volatilization.

In this process there is first a reduction of sulphate of soda to sulphide of sodium with evolution of carbonic acid; then a conversion of the sulphide of sodium and carbonate of lime into carbonate of soda and sulphide of calcium; and finally the excess of carbonate of lime is reduced by the carbon to caustic lime and carbonic oxide.

Third Operation—The Preparation of Carbonate of Soda from the Black-ash, by Lixivation and Evaporation.—For some purposes the crude soda, or black-ash, is used without further purification; for example, in the making of soap. Its lixiviation is effected by the use of a series of iron tanks, or vats, into which it is placed with water. Several tanks, each of the capacity of 600 gallons, rise above one another in successive stages, so that the liquor of the highest can be run into the next lower, and so on. The black-ash is introduced fresh into the lowest vat; it then passes from vat to vat, and is taken away exhausted at the highest one. The water, on the contrary, comes in fresh at the

top, and in passing downward encounters less exhausted ash in each succeeding vat, and finally passes away from the lowest a fully saturated solution. In most soda-works, the vats are now arranged differently, although the ash may be said to be exhausted in the same way. In the new arrangement, the vats are placed horizontally, and advantage is taken of the fact that solutions in becoming richer become also heavier, so that, although the tanks are all on a level, the water runs through them with what is virtually a downward flow. We have not space to describe minutely this very elegant and economical plan; it will be enough to say that it completely obviates the necessity of lifting the ash from vat to vat, because any two contiguous ones can be made at pleasure the highest and lowest points, and, therefore, those of ingress and egress for the lixiviating fluid. "Each vat, in due rotation, is emptied and refilled; and thus each in turn successively occupies the highest, lowest, and all intermediate points of the delicivty."

The next stage is the evaporation of the soda-lye, which is conducted in a variety of ways. A common method consists in using the waste heat of the balling furnace, the flame from which passes over the surface of the liquor. With proper manipulation the soda falls to the bottom, and is raked out at intervals through a side-door, and drained upon a sloping surface.

The soda-salts (chiefly carbonate of soda), thus obtained by evaporation of the lye, contain caustic soda, which requires to be carbonated, and a little sulphide of sodium, which it is necessary to get rid of. They are accordingly transferred to a reverberatory furnace, and calcined, at a moderate heat, along with sawdust, or sometimes with small coal, the mixture being stirred with iron paddles. By this treatment, the caustic soda is converted into carbonate of soda, the sulphur is mostly expelled, and we now obtain the *soda-ash*, or alkali of commerce, which generally contains about 50 per cent of real soda, NaO ; the other ingredients, besides the carbonic acid with which it is combined, being chiefly water, sulphur, and common salt. Sometimes it is further purified, and it is then known as *white alkali*.

Soda crystals, or what is commonly called "washing-soda," are obtained by dissolving the soda-ash in hot water, then filtering the solution and boiling it till the specific gravity reaches 1.3, when it is transferred to the crystallizing coolers. Bars of wood or iron are laid across these vessels to sustain the mass of crystals which form, and in ten days at most the crystallization is complete. Crystals of soda are purer than soda-ash, but they are of much less value, weight for weight, because of the large quantity of water which enters into their constitution, amounting to 62½ per cent.

The manufacture of caustic-soda is now an important branch of the alkali trade. For soap-making, bleaching, and several other purposes, carbonate of soda requires to be rendered caustic by quicklime. Manufacturers have, accordingly, taken to the plan of treating the black-ash liquor with hydrate of lime, and so obtain caustic-soda at this stage, instead of sending it into the market as a purified carbonate of soda, for purposes where it requires to be decarbonated again. Another plan consists in mixing a small quantity of chloride of lime, or nitrate of soda, with the soda-lye from the black-ash. It is then concentrated into a strong solution, and finally brought to the state of a fused mass in round iron pots heated to redness. Great attention is now given to the recovery of sulphur from the enormous "waste heaps" which accumulate at all large alkali works, since there is fully a ton of this "waste" produced for every ton of common salt used. It consists largely of noxious sulphides of calcium, and is a source both of river and, in warm weather especially, of atmospheric pollution. Mond's process, or some modification of it, is usually adopted. Some chemical changes are first produced in the waste by the action of common air, and the sulphur afterward precipitated by hydrochloric acid.

Various processes have been at different times proposed, and many have been patented, for making carbonate of soda by other methods than that of Leblanc; but only one of these has had any measure of success. We allude to what is called the "ammonia process," patented by Dyer & Hemming in 1838. Several improvements—some of them quite recent—have been made on the original method, and the process is now worked on the large scale at Northwich in Cheshire, and at several places on the continent. It consists in treating a solution of common salt with bicarbonate of ammonia, by which bicarbonate of soda is produced, and the chloride of ammonium remains in solution.

Sulphate of soda is made at Widnes, in Lancashire, by Mr. Hargreaves's process of decomposing bricks of common salt with sulphurous acid and steam. This method, by avoiding the direct use of sulphuric acid, saves the expense of nitrate of soda; and there is also a saving in the wear and tear of apparatus, owing to the lower temperature required.

SODA-WATER. See AERATED WATERS.

SÖDERMANLAND, a province of s.e. Sweden, bounded n. by lake Maclar, s.e. by the Baltic; 2,600 sq.m.; pop. '74, 138,696. The surface is level. The soil is fertile. Agriculture and fishing are the chief occupations. Capital, Nyköping.

SODIUM (symb. Na, equiv. 23, spec. grav. 0.972) is one of the metals of the alkalis—its oxide being soda. Its properties closely resemble those of the allied metal, potassium. It is of a bluish-white color, is somewhat more volatile than potassium, and further differs from that metal in having a higher fusing-point (about 205°), a greater specific gravity, and in not catching fire when dropped in water (unless the water is heated), although like potassium under similar conditions, it partially decomposes it and liberates hydrogen; and at the same time communicates a strong alkaline reaction to the solution. If, however, a piece of unsized paper is placed on the surface of cold water, and the sodium be placed on the paper, the metal takes fire, and burns with a deep yellow flame. Strictly speaking it is the liberated hydrogen rather than the metal which burns, the yellow tint (which is characteristic of the sodium compounds) being due to a little sodium volatilized by the heat, mixing and burning with the hydrogen. When heated in the air, it burns with its characteristic yellow flame, and is converted into soda. When exposed *in vacuo* to a red heat it assumes the form of vapor, and admits of distillation. Like potassium, it must be kept immersed in naphtha, so as to exclude the oxidizing action of the air. As a reducing agent, it is little inferior to potassium, and as its combining power is lower, and it is obtained much more cheaply, it may usually be advantageously substituted for potassium in reducing operations. Sodium does not occur in the metallic form in nature, but its compounds are very widely distributed. It is found by far the most abundantly in the form of chloride of sodium (or common salt), but it likewise occurs as albite or soda-feldspar, cryolite (the double fluoride of sodium and aluminium, and the principal source from whence aluminium is procured), borax (the baborate of soda), trona (the sesquicarbonate of soda), and Chili saltpeter (nitrate of soda).

The methods of obtaining sodium are similar to those already described for obtaining potassium. The following procedure recommended by Deville is regarded as the best for obtaining it in large quantity. Intimately mix 747 parts of dried carbonate of soda with 175 parts of finely powdered charcoal and 103 parts of finely ground chalk, knead them into a stiff paste with oil, heat them in a covered iron pot till the oil is decomposed, and finally distil them in an iron retort with the precautions which are noticed in describing the preparation of potassium (q. v.). The object of adding the chalk is to prevent the separation of the charcoal from the carbonate of soda when the latter fuses. This mixture ought to yield nearly one-third of its weight of sodium.

With regard to the history of sodium, it is sufficient to observe that Duhamel, in 1736, discovered that potash and soda (now known to be the oxides of potassium and sodium) were distinct bodies. Sir H. Davy first obtained the metal *sodium* in 1807. The symbol of this metal, Na, is the abbreviation of *natrium*, which is derived from *natron*, one of the old names of native carbonate of soda.

Sodium combines with all the elementary gaseous bodies, and two of these combinations—viz., those with oxygen and chlorine, are of extreme importance and value.

With *oxygen*, sodium forms two compounds—viz., an oxide (NaO) and a peroxide (NaO_2). The latter being of no practical value, may be passed over without notice. The oxide (soda) was formerly known as *fossil* or *mineral alkali*, to distinguish it from potash, which, from the source from which it was procured, was termed *vegetable alkali*. Anhydrous soda (NaO) is procured by burning the metal in dry air; it is of a yellowish-white color, powerfully attracts moisture, and retains the water so firmly that it cannot be expelled by heat. Hydrated or caustic soda ($\text{NaO.H}_2\text{O}$) closely resembles, both in its properties and in the mode of procuring it, the corresponding potash compound. It is, however, not so fusible as the latter, and is gradually converted, by exposure to the air, into carbonate of soda, which is also an infusible salt in its anhydrous state. Solution of hydrate of soda (or soda lye) is largely employed in the arts. It is prepared by boiling a tolerably strong solution of carbonate of soda in milk of lime until a portion of the filtrate ceases to effervesce on the addition of an acid. The solid hydrate has a specific gravity of 2.13, and the quantity of anhydrous soda in any solution may be pretty closely approximated to by determining the specific gravity of the fluid at a temperature of 59° . Tables for this purpose have been constructed by Dalton (quoted in Miller's *Inorganic Chemistry*, 2d ed. p. 37), and by Zimmerman (reprinted in the article "Sodium" in Knight's *English Cyclopædia*).

Many of the combinations of the oxide of sodium (soda) with acids—constituting soda salts—are of great importance. Carbonic acid forms three salts with soda—viz., a normal carbonate, a sesqui-carbonate, and a bicarbonate of soda.

The *normal or ordinary carbonate of soda* ($\text{NaO.CO}_2 + 10\text{Aq.}$), popularly known as the *soda* of commerce, is a colorless, inodorous salt, with a nauseous alkaline taste. It crystallizes in large transparent rhomboidal prisms, which contain nearly 63 per cent of water, but it readily parts with all this water on the application of heat. The crystals also lose the greater part of their water on mere exposure to the air, when they effloresce and fall to powder. Water at 60° dissolves half its weight of the crystals, and boiling water considerably more, the solution acting like an alkali on vegetable colors. This salt occurs native in the natron-lakes of Hungary, Armenia, etc., in association with sulphate of soda and chloride of sodium. In other regions it appears in an efflorescent form on the surface of the earth. It is now, however, almost entirely manufactured from sea-salt. See SODA, MANUFACTURE OF.

Sesquicarbonate of soda ($2\text{NaO}, \text{HO}, 3\text{CO}_2 + 3\text{Aq}$) occurs native in the form of large, hard, non-efflorescent prisms, in Hungary, Egypt, Mexico, etc., under the name of *trona* or *natron*. When strongly heated, it loses one-third of its carbonic acid, and becomes converted into the preceding salt.

Bicarbonate of soda ($\text{NaO}, \text{HO}, 2\text{CO}_2$) may be formed by passing a current of carbonic acid through a strong solution of carbonate of soda, till saturation takes place, and allowing the mixture to crystallize; or it may be produced on a large scale by exposing crystals of carbonate of soda to a prolonged current of carbonic acid. The bicarbonate crystallizes in four-sided prisms, which require 10 parts of water at an ordinary temperature for their solution. This salt is used largely in medicine. See AERATED WATERS.

Sulphuric acid forms with soda a normal and an acid sulphate.

The *normal or ordinary sulphate of soda* ($\text{NaO}, \text{SO}_3 + 10\text{Aq}$) has been already described under its synonym of *Glauber's salt* (q.v.). The acid salt, or *bisulphate of soda* ($\text{NaO}, \text{HO}, 2\text{SO}_3$) is of no special interest.

The *hyposulphite of soda* ($\text{NaO}, \text{S}_2\text{O}_3 + 5\text{Aq}$), occurs in large colorless, striated, rhombic prisms, of a cooling a sweet taste. When strongly heated in the air, it burns with a blue flame. It dissolves readily in water, depositing sulphur if the solution be kept in a closed vessel. It may be obtained by digesting a solution of sulphite of soda on powdered sulphur. The sulphur is gradually dissolved, and forms a colorless solution, which, on evaporation, yields crystals of hyposulphite of soda. This salt is largely employed in photography, and is occasionally prescribed medicinally. Sulphurous acid forms two salts with soda—viz., a sulphite and a bisulphite. The *sulphite of soda* ($\text{NaO}, \text{SO}_2 + 7\text{Aq}$) is obtained by passing sulphurous acid over carbonate of soda, dissolving the resulting mass in water, and crystallizing; when the salt is obtained in efflorescent oblique prisms, which fuse at 113° , and are soluble in 4 parts of cold water, the solution having a slightly alkaline reaction, and a sulphurous taste. This compound is commercially known as *antichlore*, and is largely used in paper-manufactories for the purpose of removing the last trace of chlorine from the bleached rag-pulp. The *bisulphite* is of no importance. *Nitrate of soda* (NaO, NO_3), known also as *cubic niter* or *Culi salt-peter*, occurs as a natural product on the surface of the soil of certain South American districts. In most of its properties, excepting its crystalline form, and further in its being deliquescent, it resembles nitrate of potash. It is used to a considerable extent as a manure. The *phosphates of soda*, though comparatively numerous, do not call for notice here. See PHOSPHATES. *Hypochlorite of soda* (NaO, ClO) is at present only known in solution, in which it occurs as a yellowish-green fluid, evolving a smell of chlorine; it has strong bleaching power, and, when boiled, becomes decolorized, and evolves chlorine freely. It is formed by passing a stream of chlorine gas through a solution of carbonate of soda, the resulting solution containing the hypochlorite, together with undecomposed carbonate of soda and chloride of sodium. This solution is useful as a bleaching agent, as an oxidizing agent in analytical chemistry, and as a disinfectant agent. There are two *borates of soda*, of which the only important one, the *biborate*, is already described under its ordinary name of *borax* (q.v.). Various *silicates of soda* have been formed. In reference to the properties of these salts, see the articles FUCH'S SOLUBLE GLASS and GLASS.

The *haloid salts* of sodium resemble, in their general characters, the corresponding salts of potash. Of these by far the most important is *chloride of sodium* or *common salt*, formerly known as *muriate of soda* (NaCl). It occurs naturally in far greater quantity than any other soluble salt. See ROCK-SALT, SEA, WATER. The following are its leading properties: It crystallizes in colorless, transparent cubes, which are anhydrous, soluble in about 3 parts of cold water, and scarcely more soluble in boiling water. A saturated solution has a specific gravity of 1.205, the specific gravity of the salt being 2.125. It is insoluble in pure alcohol, is inodorous, and has a purely saline taste, unmingled with bitterness, unless chloride of magnesium be mixed with it. At a red heat it fuses, and becomes converted into a transparent brittle mass. The well-known decrepitation which occurs when salt is thrown on the fire, or otherwise strongly heated, results from the sudden expansion of water mechanically entangled among its particles. The uses of this salt have been known from the earliest times. It is an essential constituent of the food both of man and animals. From want of space we must refer our readers to Liebig's *Lectures on Chemistry* (Letter xxviii.) on this subject, in which the functions of salt in the food and in the blood are clearly pointed out. It is regarded as a necessity even by the rudest nations. "In several countries of Africa men are sold for salt; among the Gallas and on the coast of Sierra Leone the brother sells his sister, the husband his wife, and parents their children, for salt; in the district of Accra (Gold coast), a handful of salt, the most valuable merchandise after gold, will purchase one, or even two slaves."—Note to Liebig's *op. cit.*, p. 413. Chloride of sodium is employed in the process of salting meat in consequence of its powerful antiseptic properties. Meat thus prepared loses, however, a considerable portion of its nutritive juices, which pass into the brine, and is less digestible than in its natural state. Among the purposes for which this salt is mainly employed may be mentioned the manufacture of the various salts of soda, especially the carbonate; the preparation of hydrochloric acid; the glazing of stoneware; the preparation of soap, etc. The other haloid salts—the iodide, bromide, and fluoride of sodium—require no notice.

Sodium has been recently found to enter into various groups of organic bodies. We shall take the sodium-alcohols as an example. When sodium or potassium is gradually added to anhydrous alcohol, the temperature rapidly rises, the metal is dissolved, hydrogen is evolved, and a fusible deliquescent compound is formed, which has received the name of *sodium-alcohol* (or potassium-alcohol), or of *ethylate of soda* (or potash), its composition being such that it may be regarded as alcohol in which one atom of hydrogen is replaced by one of the metal; as shown in the equation:

The action of sodium or potassium on the other alcohols is of an analogous nature.

The tests for the salts of sodium are not very satisfactory, because the metal forms scarcely any insoluble compounds. A salt of sodium is usually concluded to be present when, the absence of all other bases having been proved, a saline residue remains, which, with bichloride of platinum, yields yellow striated prisms ($NaCl, PtCl_2 + 6Aq$) by spontaneous evaporation. Before the blowpipe the salts of sodium are known by the intense yellow which they communicate to the outer flame, and if a weak alcoholic solution of one of the salts is burned, a similar yellow tint is communicated to the flame. Spectrum analysis is too delicate to be of much practical use. Bunsen estimates the amount of soda that may be thus detected at the 195,000,000th part of a grain; and considering how universally diffused chloride of sodium is, this fractional amount is hardly likely to be absent.

In conclusion, the *medicinal uses* of the sodium compounds require our notice. They will be considered alphabetically. *Acetate of soda* is a mild diuretic, similar in operation to acetate of potash, for which it may be substituted. It may be given in doses varying from a scruple to a couple of drams. *Arseniate of soda* ($2NaO, HO, AsO_5 + 14Aq$) is serviceable in periodic affections, chronic skin-diseases, and the cases in which arsenic is generally employed in medicine. It has all the advantages of arsenite of potash, and seems to cause less irritation of the stomach. It is best given in the form of *Pearson's solution*, which consists of 1 grain of the crystals of this salt dissolved in 10 drams of distilled water. Dose, from 20 minims very gradually increased to 2 drams, 3 times daily. The *liquor soda arseniatis* of the pharmacopoeia is much stronger; its dose being from 3 to 10 minims. Paper impregnated with a solution of arseniate of soda sweetened with sugar is sold as a poison for flies. *Bilorate of soda*, or *borax*, is employed principally as a tropical astringent, and is used with advantage in aphthous eruptions of the mouth and throat. *Bicarbonate of soda* is a most popular remedy in cases of dyspepsia, but its use is highly injurious when there are phosphatic deposits in the urine. See PHOSPHATIC DIATHESIS. Ncigan strongly recommends the external application of an ointment consisting of 20 or 30 grains of the bicarbonate, with an ounce of cold cream, in cases of papular and vesicular eruption of the scalp. *Carbonate of soda* is not employed as an antacid so frequently as the bicarbonate, in consequence of its disagreeable taste; but in the dried state, when deprived by heat of its water of crystallization, it is much used as an alterative. In dyspepsia attended with acidity, a combination of the dried carbonate with blue pill and rhubarb pill is often extremely useful. As it has a very acrid taste, it should be combined, if given in powder, with some bland substance, such as compound tragacanth powder. *Solution of chlorinated soda* (known also as *solution of chloride of soda*, *chlorinated soda*, *hypochlorite of soda*, and *Labarraque's disinfecting liquor*) is preferable to hypochlorite of lime in destroying noxious effluvia, as the salt which is left does not deliquesce, while chloride of calcium is very deliquescent. It may be applied locally to foul ulcers, either in lotion (2 drams to 8 ounces of water), or as a poultice with linseed meal and boiling water. *Phosphate of soda* ($2NaO, HO, PO_5 + 24Aq$), known also as *tasteless purging salts*, is a mild saline purgative, with a far less unpleasant taste than sulphate of magnesia. It is especially adapted as a purgative for persons affected with deposits of red gravel (lithic or uric acid) in the urine. The dose varies from half an ounce to 2 ounces, and it may be given in broth, to which it imparts only a saline taste. *Sulphate of soda*, and *tartrate of soda and potash*, have been already described under their ordinary names of *Glauber's salt* (q.v.) and *Rochelle salt* (q.v.).

SODOM, APPLE OF, the name given to the fruit of a species of *solanum* (q.v.). But it seems that the true APPLE OF SODOM, or MAD APPLE, of the shores of the Dead sea, mentioned by Strabo, Tacitus, and Josephus, and described as beautiful to the eye, but filling the mouth with bitter ashes if tasted, is a kind of gall, growing on dwarf oaks, and produced by a species of gall-insect, which has received the name of *cynips insana*. These galls are about 2 in. long, and 1½ in. in diameter, of a beautiful, rich, glossy, purplish-red color, and filled with an intensely bitter, porous, and easily pulverized substance, surrounding the insect. They are attached to the twigs in a curious manner, different from other galls, the narrow end "rising upward on each side, and bending inward, so as to clasp the extremity of the twig somewhat like a pair of wide and curved nippers."

SODOM AND GOMORRAH, two ancient cities of Syria, almost invariably spoken of in conjunction in the Bible, and forming with Admah, Zeboiim, and other towns, the "cities of the plain," which on account of the enormous wickedness of their inhabitants (the nature of which is indicated in the term sodomy), are said to have been overthrown—not submerged—by some terrible convulsion of nature. Modern writers on sacred topography are not agreed as to the precise site to be assigned to these cities, no trace of which now remains; the majority holding that they stood on the southern shore of the Dead sea, near the salt hill of Usdum; while others, again, apparently with more countenance from the Scripture narrative (Gen. xiii. 10-13) maintain that Sodom, Gomorrah, and the other "cities of the plain," stood in the "circle or plain of the Jordan," e. from Bethel and Ai, near where the river discharges itself into the Dead sea. The popular belief, that the cities were miraculously overwhelmed by the waters of the Dead sea, and that their remains may still be seen at the bottom, is an idle tale of superstitious travelers, uncountenanced either by fact or by the terms employed by Scripture to describe the catastrophe.

SODOMY, an unnatural crime, is punishable with penal servitude for life, or any term not less than ten years, and the attempt to commit it is punishable with penal servitude from three to ten years. In Scotland it is still nominally a capital offense, but never punished except by penal servitude and imprisonment.

SODOR AND MAN, BISHOPRIC OF. See **HEBRIDES** and **MAN**

SOEST (pronounced *Soist*), a t. of Prussia, province of Westphalia, 36 m. s.e. of Münster by railway, was, during the middle ages, a Hanse-town and fortress, and, in point of commercial importance, one of the foremost cities of Germany, with a pop. of from 60,000 to 70,000. Now, however, it is only the shadow of its former self; but relics of its ancient splendors still survive in its numerous and magnificent churches, of which the finest is the "meadow church," restored in 1850. Its municipal law, the *jus susutense*, was the oldest in Germany, and served as the model for the other imperial free-towns, Lübeck, Hamburg, etc. At present Soest has some trade in corn, and extensive breweries. Pop. 75, 13,122.

SOFA LA, or, as the old geographers sometimes wrote it, **CEFOLA**, is the name given rather indefinitely to that portion of the s.e. coast of Africa extending from the delta of the Zambezi (Quama of old geographers) as far s. as the Rio Maneci or Delagoa bay, or from lat. 18° to 26° s., although some modern geographers consider cape Corrientes as its southern limit. This stretch of coast now comprehends the Portuguese captaincies of Rio de Senaa, Tetè, Sofala, and Inhambane, besides the regions round Delagoa bay, nominally under the control of the crown of Portugal, the extent inland being generally limited by the mountain region which runs parallel to the coast of southern Africa, and forming a belt of low country about 150 m. wide, full of swamps, densely wooded, and generally unfavorable to European life.

Sofala, in common with the remainder of the coast of eastern Africa, was conquered by the Arabs between the 8th and 12th c.; it was visited in 1480 by Pedroa Cavalho, a Portuguese captain, from Abyssinia, before the route by sea to India was discovered. In 1500 the Portuguese, under Albuquerque, commenced making settlements on this coast, and built a strong fort on an island in the mouth of the Rio de Sofala, near a town which was founded 200 years before by the Arabs, and which still exists, although in a very decayed state. The inland region at the back of the coast district, now occupied by the Transvaal Boers toward the s., or by Moselikatse and his Amatabele to the n., and stretching away northward for an indefinite distance, formed the celebrated though mythical empire of Monomotapa, the accounts of which by the early travelers are perfectly marvelous. Sofala was considered by the old geographers as a very rich, gold-producing country, and was judged by some to be the Golden Ophir to which king Solomon every three years sent a fleet of ships; and, indeed, it seems to have derived its name from the Greek *sophira*, by which Ophir is translated in the Septuagint. Lopez tells us that in his time the inhabitants related that the gold-mines of Sofala afford yearly two millions of metrigals—every metrigal accounted for a ducat. Whatever may have been its former reputation, Sofala has long ceased to be a gold-producing country to any considerable extent.

An old writer says: "Great wild elephants overspread the country, which the natives neither know how to tame nor manage; nor are lions, bears, stags, or harts and boars fewer; besides, sea-horses sport themselves in the Quama." This description is pretty accurate, even at the present day, if we omit the bears, and call the stags antelopes; for the elephants, rhinoceroses, and other large game, driven away from the highlands in the interior by the pursuit of the cape hunters, have descended into the coast lowlands, where the dense bushy nature of the country, and its extreme unhealthiness, protect them from extermination, although such keen sportsmen as McCabe, Chapman, and Edwards have not feared to follow them there.

The most northern regions of Sofala are the captaincies of Rio de Senaa and Tetè, formerly called Matuka, which include the country on the right bank of the Zambezi, sloping down from the Malappo mountains, which bound its basin on the south. The principal places are Tetè, in lat. 16° 12' s., long. 31° 50' e.; and Senaa, in lat. 17° 30', long. 34° 40'. The middle region comprises the captaincy of Sofala, the seat of government

being at the town or fort of that name, in the bay of Massangane; lat. $20^{\circ} 12'$, long. $34^{\circ} 40'$. Inhambane is the name of the most southerly captaincy, in lat. $23^{\circ} 51'$, and long. $35^{\circ} 20'$. There are other inconsiderable Portuguese factories along the coast of Inhampoorra, s. of Inhambane, Mambone, and Lorenzo Marquez, in Delagou bay, where a Portuguese governor resides.

Although nominally under Portuguese rule, yet the authority of that government rarely extends outside of the walls of the miserable forts held by its agents. It is computed that on the whole of the Portuguese settlements on the e. coast of Africa there are not more than 500 colonists of European birth. Trading-parties of Dutch Boers from the Transvaal territory occasionally visit the factories of Inhambane, Sofala, and Lorenzo Marquez, to purchase articles of European manufacture in exchange for ivory, wax, timber, etc. The natives, generally, are of the negro type, gradually approximating to the more intellectual Zulu Kaffir as we proceed from the Zambezi to Delagou bay.

The principal exports from this region are ivory, beeswax, hides, and rhinoceroses' horns, while a considerable clandestine traffic is said to be carried on in slaves. Considerable amounts of gunpowder, lead, coffee, and European clothes find their way up from the coast to the Boer settlements in the highlands of the interior. The coast-line is generally low and sandy, and dangerous on account of shoals and sand-banks. A group of islands, called Bazaruta, lie off the coast n. of cape St. Sebastian, in lat. 22° s. The best harbor is that of Inhambane, and ships may ascend to the town, about 8 m. from the mouth of the river. The harbor at the mouth of the Rio de Sofala is difficult of access on account of its bar.

SOFFIT, a small ceiling, formed into panels, as over windows, ingoings of doors, staircases, etc.

SOFTAS, in the early days of Mohammedism, were paupers, who loitered about the mosques and had benches outside on which they slept, from which circumstance they were called *softas*, "men of the bench." In time the term came to be applied to all attached to the mosques, and in particular to the students of the higher theological branches, thus resembling the body of "fellows" of an English college. They exercise great political influence over the fanatical lower classes. There are now about 16,000 of the softas.

SOFTENING AND INDURATION are terms used to express a pathological diminution and augmentation of the consistence of the tissues or organs of the body. These changes may arise from inflammatory action; but softening may also be induced by causes totally distinct from inflammation, as, for example, from a deficient supply of blood, from scrofula or cancer, or from long-continued functional inactivity (as in the case of paralyzed muscles). Among the parts liable to both softening and induration are the brain and spinal cord, the heart, the lungs, the serous and mucous membranes, the liver, the spleen, the kidneys, the uterus, and the bones and cartilages. For further details on the subject the reader may consult the English translation of Vogel's *Pathological Anatomy*.

SOFT-GRASS, *Holcus*, a genus of grasses having a lax panicle, two-flowered spikelets, with two nearly equal glumes. The species are not numerous. The English name is derived from the soft and abundant pubescence of the British species, which are two in number—CREEPING S. (*H. mollis*), and WOOLY S. or MEADOW S. (*H. lanatus*), both perennial grasses and both very common. Meadow S. is found most abundantly on damp, moorish, or peaty soils, on which it is sometimes sown, as it yields abundant herbage; but it is very inferior to some other grasses, and therefore unsuitable for rich meadows and pastures. Creeping S. is generally found on dry, sandy, or other light soils, and very much resembles meadow S., but is still more downy and of smaller size. The roots sometimes extend 5 or 6 ft. in a season. The roots contain much nutritious matter, and are a very acceptable food to horses and cattle, but especially to hogs, which grub them up for themselves when they have opportunity.

SOGDIA'NA, in ancient geography, a country in Asia, bounded on the n. by the Jaxartes, which divided it from Seythia; on the s.w. by the Oxus, which divided it from Bactria; and on the n.w. by the sea of Aral. It was conquered by the Persians in the reign of Cyrus; was invaded by Alexander, after whose time it fell into the power of Syria.

SOHAR, a t. on the sea of Oman, in Oman, Arabia; capital of the province of Batina; pop. about 20,000. It is defended by a wall, and has a castle. Woolen stuffs, carpets, fire-arms, and silk are the chief manufactures. Its trade has been taken away by Muscat.

SOHN, KARL FERDINAND, 1805-67: b. Berlin, Prussia; studied art at the Berlin academy, at Düsseldorf, and in Italy. He painted a large number of pictures, all noted for the rich coloring of the female figures. Among the best were "The Two Leonoras," "Romeo and Juliet," "The Lute Player," and "The Four Seasons." From 1838 to 1855 he was professor at the Düsseldorf art academy.

SOIGNIES, a t. of Belgium, province of Hainault, 22 m. s.w. of Brussels by railway. Its church of St. Vincent Maldegaire, founded in the 10th c., if not earlier, is probably

the oldest in Belgium. Soignies has breweries, distilleries, trade in stone and lime, and large fairs. Pop. 7,000.—Some m. to the n.e., in the province of South Brabant, lies the forest of Soignies, at whose southern extremity is situated the famous field of Waterloo.

SOILS consist of the disintegrated materials of the hard crust of the earth, mixed with decayed vegetable matter. This disintegration is effected partly by the chemical action of oxygen, carbonic acid, and the other acid or alkaline substances brought by the atmosphere to bear upon rocks, and partly by the wearing action of water in a fluid state or in the form of glaciers, or by its bursting force when frozen in deep clefts. The soils produced by running water, floods, and tides, are found along the banks or at the mouths of rivers, and are generally called *alluvial soils*; those produced by glacier action are known as *drift soils*; and both are generally found at a great distance from the rocks of whose disintegrated materials they are composed. But by far the greater mass of soil has been produced in the other way above mentioned, by the gradual weathering of rock under atmospheric influence; and it is generally found adjoining or overlying the rocks from which it has been produced. Immediately beneath the soil or stratum of earth which affords nourishment to plants, is a mass of earth or rock, unmixed with decayed vegetable matter, to which the term *subsoil* is applied. The subsoil may or may not be similar in its geological constitution to the soil; and from the absence of vegetable matter, is generally lighter in color than the latter.

Every species of rock has produced its soil; but the older formations, from their greater hardness and power of resistance to atmospheric action, produce, in proportion to their exposed surface, less soil than do the secondary and tertiary groups. The fertility of soils has no relation to the chronological succession of the strata of the earth's crust; thus, igneous rocks produce a naturally fertile soil, though they seldom become thoroughly disintegrated; metamorphic or transition rocks furnish one of poor quality, as does also the greater portion of the Silurian system; while to the vast mass of the secondary group of deposits, especially the Devonian system, with its old red sandstone, and limestone, and marl beds, the mountain limestone of the carboniferous system, and the new red sandstone of the Permian and triassic systems, belong some of the richest tracts in great Britain, though numerous members of the same group supply barren and ungrateful soils. The lias, and oolitic, and wealden systems generally supply clay-soils of considerable fertility, but of the densest texture and most intractable character; soils formed from the cretaceous group are extremely variable in quality; but when the chalk is largely mixed with sand or clay, they exhibit a considerable degree of fertility; however, they have one great general defect, that of not sufficiently retaining moisture. The soils produced from the tertiary formations possess no general characteristics, being sometimes extremely fertile, and again almost wholly barren; and, in short, we are bound to come to the conclusion that the mere geological composition of soils affords no very reliable criterion by which their economic value can be estimated; the same rock which produces the almost barren soil of Argyleshire, weathers into the fertile soil of the Channel islands; and to the old red sandstone is due at once the rich soil of Hereford, Monmouth, Moray, and Strathmore, and some of the most barren heaths and moors in Scotland. These apparent anomalies are no doubt largely produced by the various action of heat, moisture, and other meteorological agencies.

But however soils may vary in a geological point of view, they are all resolvable into a few elements—viz., the various compounds of aluminium, iron, manganese, the four alkaline metals, the seven alkaline earths, and the four organic elementary substances. These eighteen bodies supply, singly or in combination, all the constituents necessary to the growth of plants, each of them having its own portion of the plant to sustain—the silica producing strength and rigidity in the stems; alumina giving tenacity to the soil, and so rendering it a stable support; magnesia perfecting the seeds; iron absorbing oxygen and ammonia from the atmosphere, and giving it up as required; and so on. Of these ingredients, silica, alumina, lime, along with matter derived from organic bodies, constitute the bulk of the soil; the other ingredients existing only in minute quantity, and hence is derived the common quadruple division of soils into *siliceous or sandy, argillaceous or clayey, calcareous, and humous*.

It is not sufficient that soil possesses all the ingredients necessary for rendering it fertile, or that these ingredients are in a sufficiently comminuted state to enable them to be absorbed; there is besides a certain physical or mechanical condition necessary. Thus, for example, a soil which possesses too great a proportion of silica is too little retentive of moisture, and has not sufficient consistency of texture to be an effective support of tall plants; one in which calcareous matter abounds is also too dry a soil; while if alumina predominates, it is generally too retentive of moisture; and a great excess of the last-named ingredient renders it so extremely tenacious as to be almost incapable of reduction to a proper mechanical state. The soil which is physically most perfect is composed of about equal proportions of the two great ingredients, silica and alumina, and is generally known as *loam*, being distinguished into *clay loam* or *sandy loam*, according as the alumina or silica sensibly predominates. But the physical qualities of soils do not wholly depend upon their composition; they are also largely affected by the depth of the soil itself, and the quality of the subsoil. Should the soil and sub

soil be both retentive, or both porous, the defects of these states as to dryness or moisture are considerably increased; if porous and retentive soils of good depth rest upon subsoils of a contrary character, the defects of the former are to a considerable degree amended. But the advantages and disadvantages of these conditions must to a very large extent be judged by the prevalent character of the climate, a somewhat porous subsoil in a cold moist district being generally preferable, and *vice versa*. Each of these classes of soils, when possessed of the chemical ingredients in quantity sufficient for the wants of plants, and of a texture favorable to their growth, excels in the production of certain species. Thus, the clay loams are unequalled for the production of wheat and beans; the sandy loams for barley, rye, and the various root-crops; while both are well suited for the growth of the other cultivated plants, or for perennial pasture.

Besides the calcareous and marly soils which may be, according to circumstances, classed as a clayey or sandy soil, rarely the former, there is the humous soil, which possesses characteristics peculiarly its own. It is not devoid of consistency like the sandy, or retentive of moisture like the clayey soils, but in its natural state is spongy and elastic in texture, of a remarkably dark color, and, when dried, becomes inflammable, and even when much improved by culture retains these characteristics in a considerable degree. It consists wholly, or to a great extent, of vegetable matter, and is found in perfection in forests of ancient date, as the woods of America, and in the peculiar form of peat (q.v.) in many parts of the world. In its ordinarily decomposed condition, it is at once the richest of soils; but in the state of peat it calls for long-continued drainage, and the application of decomposing agents, before it can be rendered of service in the production of crops.

Improvement of a soil must, then, as is seen from the foregoing considerations, be effected either by supplying the substances required by plants to a soil which is deficient in them, by altering its depth and texture, and by removing excess, or supplying deficiency of moisture. The first of these objects is effected by the introduction and incorporation of manures (q.v.) with the soil, care being taken that the manure contains the requisite ingredients, and in such a condition as to be assimilable by plants either directly or indirectly through the soil, and by the more thorough exposure of the soil to the action of the atmosphere; the second is effected by the admixture of marl or clay with sandy, chalky, or peat soils, of lime, ashes, or burned clay, with tenacious clay soils, or by the mixture of the subsoil (if differing in quality) with the soil by means of the subsoil plow, or by more complete surface-tillage, and free exposure to the action of frost; and the third is accomplished by drainage (q.v.) and irrigation (q.v.). The fertility and chemical composition of a soil may be approximately determined by inspection of its color and texture; but more accurately, as well as its dryness or moisture, excess or defect of silica and alumina, by the predominance of certain species of wild plants or weeds.

SOISSONS, a t. of France, in the department of Aisne, stands in a fertile vale on the banks of the river Aisne, about 65 m. n.e. of Paris. Soissons is the key of Paris for an army invading France from the Netherlands, and is the meeting-point of six military roads. The principal building is the cathedral, founded in the 12th c. the library of which contains many rare MSS. There are also some remains of the great castellated abbey of St. Jean des Vignes, where Thomas à Becket found refuge when in exile. Quite near to Soissons is an institute for "deaf and dumb," which occupies the site of the famous abbey of St. Médard, where Clothaire and Siegbert were buried. Soissons has manufactures of linen, woollens, and cottons. Pop. '76, 10,754. Soissons is one of the oldest towns in France, and was celebrated even in the time of the Romans, when it bore the names first of *Noviodunum*, and afterward of *Augusta Suessionum*; hence its modern name of Soissons. It was the last Roman stronghold in Gaul that withstood the arms of Clovis, who here overthrew Syagrius, the Roman commander, in 486, and made it the seat of the Frankish monarchy, which it long continued to be.

SOKOTO, a kingdom of Africa, in Sudan, on the s.w. of lake Tchad, and separated from it by the state of Bornu (q.v.). Area, 117,000 sq. miles. The inhabitants, who are mostly of the Fulbe tribe, are numerous. A formidable military force is maintained.—*Sókoto*, the capital, stands on the Zirmie, an affluent of the Sókoto, which flows into the Quorra. Its market is of great importance; it trades in raw silk, glass-ware, and perfumery, carries on extensive and famous manufactures of leather goods, and has from 20,000 to 22,000 inhabitants.

SOLANACEÆ, or **SOLANÆÆ**, a natural order of exogenous plants, mostly herbaceous plants and shrubs, but including a few tropical trees. The leaves are mostly alternate, undivided, or lobed, without stipules. The flowers are regular, or nearly so; the calyx and corolla generally 5-cleft; the stamens generally five. The fruit is either a capsule or a berry, mostly 2-celled. The plants of this order are mostly natives of tropical countries, a small number extending into the temperate and moderately cold climates of both hemispheres; in the coldest regions they are entirely wanting. They are mostly distinguished by an offensive smell, and by containing in greater or less abundance a narcotic, poisonous substance, usually associated with a pungent principle, and some of them are among the most active poisons. Sometimes the narcotic substance predominates, as in mandrake (q.v.) and henbane (q.v.); sometimes the pungent substance pre-

dominates, or is alone present, as in Cayenne pepper (*capsicum*); sometimes both are present in more or less equal proportion, as in tobacco, thorn-apple, or stramonium, and belladonna. The fruit is generally poisonous; but that of a considerable number of species, in which acids and mucilage predominate, is eatable, as, for instance, the berries of the winter cherry and other species of *physalis*, those of the egg-plant (q.v.) and some other species of *solanum*, and of the love-apple (*lycopersicum*). The tubers, which occur in a few species, contain much starch, and serve as an article of food, of which the potato is the chief example. The seeds of all contain a fixed oil, which in the s. of Germany is expressed from the seeds of the belladonna itself.

SOLANDER, DANIEL CHARLES, LL.D., 1736–82; b. Sweden; studied with Linnæus; graduated in medicine at the university of Upsala; visited England in 1760; accompanied sir Joseph Banks on the voyage round the world with capt. Cook; appointed under librarian of the British museum, 1773, to which he left a collection of valuable manuscripts. He wrote a *Description of the Collection of Petrifications found in Hampshire*, and *Observations on Natural History in Cook's Voyage*.

SOLAN GOOSE. See GANNET.

SOLANO. See SIMOOM.

SOLANO, a co. in central California, bounded on the s. by the strait of Carquinez and Suisun bay; crossed by the California Pacific railroad; about 800 sq.m.; pop. '80, 18,475—12,564 of American birth. The surface is varied. The soil is fertile. The principal productions are cattle, wheat, barley, wool, and wine. Co. seat, Fairfield.

SOLANUM, a genus of plants of the natural order *solanaceæ*, containing a great number of species, which are distributed all over the world but are particularly abundant in South America and the West Indies. Some of the species are herbaceous, others are shrubs; some of them unarmed and some of them spiny; many covered with a down of star-like hairs. The flowers are in false umbels, or almost in panicles; seldom in racemes, or solitary. The anthers open by two holes at the top. The berries are two-celled, and contain many smooth seeds. The species of this genus almost always contain in all their parts a poisonous alkaloid, *solanine*, in greater or less quantity, sometimes so much that the leaves or the berries cannot be eaten without danger, while in a few species the quantity present is so small as to be insignificant, and these parts are eaten freely, being agreeable and harmless. By far the most important of all the species is *S. tuberosum*, the potato (q.v.), in which, however, solanine is found in considerable quantity, so that not only the herbage, but the juice of the raw tubers is unwholesome. Of the species with eatable fruit, the principal is *S. melongena*, the egg-plant (q.v.).—The only British species are *S. dulcamara*, the bittersweet (q.v.), and *S. nigrum*, the common nightshade (q.v.), both of which possess poisonous and medicinal qualities. The berries, leaves, bark, and roots of various species are employed for different medicinal uses in the warm countries of which they are natives; but their properties have not yet been sufficiently investigated. The berries of *S. saponaceum* are used as a substitute for soap.

SOLAR, an upper chamber or loft. The only private apartment in the old baronial halls was so called. It was placed over the pantry, at one end of the hall, and served as parlor and sleeping apartment for the baron and his family.

SOLAR CYCLE. See PERIOD.

SOLAR MICROSCOPE, an instrument for producing magnified images of minute objects on a screen, through the agency of the sun's rays. The tube of the microscope is conical, and is fastened to the interior side of a closed window-shutter over a hole in the latter; a reflector, placed at the hole so that the rays of light may fall on it, is so adjusted as to throw them along the tube. They are then collected by a powerful double convex lens, and thrown on the object, which is inserted into the tube at the focus of the lens by a slit at the side. After passing the object, the rays again pass through a single lens, or a combination of lenses, make their exit from the tube, and fall on a screen, on which they depict a magnified image of the object. We have here supposed the object to be so translucent as to allow of the passage of rays through it. Should it be opaque, the rays of light reflected from the mirror are caught by the double convex lens, which concentrates them on another mirror near the opposite end of the tube; they are thence reflected upon the back of the object, and diverge on the system of lenses at the mouth, which form the image. Instead of the sun's rays, the oxyhydrogen lime-light (and more recently the electric light) has been employed, its rays being thrown on the double-convex condenser by means of a concave reflector, in whose focus the piece of burning lime or marble is situated. The instrument is hence often called the *oxyhydrogen microscope*.

SOLAR SYSTEM. The planets and comets which circle round the sun combine with it to form a system to which is given the name of *solar* or *planetary* system. It is probable that each star is the center of an analogous system. This, however, is merely a matter of speculation, and in no way practically concerns us; but it is different with the solar system. No change of much magnitude can take place in the elements of the planets without having effect on the earth and its inhabitants, on account of the mutual attractions of the planets for each other; in fact, they appear as members of one isolated family, bound together by common ties, which could not be ruptured in the case of one

individual without communicating a general shock to the others. The various members of the solar system are noticed under PLANETS, PLANETOIDS, COMET, SUN, MOON, SATELLITES, METEORS in SUPP., vol. x.; and their motions are treated of under GRAVITATION, CENTRAL FORCES, PRECESSION, etc., so that it only remains here to give the more interesting numerical facts connected with them, which can be done most conveniently in a tabular form.

SOLAT' TIUM, in Scotch law, means compensation for wounded feelings, and is something over and above the ordinary pecuniary value of the damage. In England such a ground of damages is not in strict principle admitted, but in practice there is no substantial difference.

SOLDER, an easily fusible alloy used for joining metals. Solders are of various kinds, suited to different metals. They always require to be used with a flux, such as borax, resin, chloride of zinc, sal-ammoniac, etc. The following are the principal solders: *Peacemakers' solder*—bismuth, 2 parts; lead, 4 parts; tin, 3 parts. This can be used for coarse work by the direct application of naked fire; but for fine work, requiring the protection of a muffle-furnace, the composition must be bismuth and lead, of each 1 part; tin, 2 parts. *Plumbers' solder* for coarse work—tin, 1 part; lead, 3 parts. For finer work—tin, 2 parts; lead, 1 part. *Spelter solder*—12 parts zinc to 16 parts of copper. *Soft spelter solder*—equal parts of copper and zinc. When solders are applied in the common work of plumbers and tinmen, a tool called the soldering-iron is used: this is made red-hot, and affords a convenient means of applying fire direct to the solder and flux. Although called the soldering-iron, the portion of the tool to be heated must be of copper. In many manufactures, a flame produced by a mixture of atmospheric air and coal-gas is used to melt the solder; and for fine work, such as jewelry, the common blow-pipe is often used.

SOLDIER is one who enters into an obligation to some chieftain or government to devote for a specified period his whole energies, and even if necessary his life itself, to the furtherance of the policy of that chief or government. The consideration may be immediate pay, or prospective reward; or the contract may be merely an act of loyal devotion. The acknowledgment of the service by the employer constitutes the man a recognized soldier, and empowers him to take life in open warfare, without being liable to the penalties of an assassin and a robber. The fact of being mercenary, that is, of receiving wages for killing and being killed, does not render a soldier's trade less honorable. He bears arms that others may be able to do without them; he is precluded by the exigencies of military training from maintaining himself by peaceful occupation; and it is therefore but fair that those whom he protects should support him, and give him, over and above actual maintenance, reasonable wages for the continual risk of his life. If a man willingly enlist himself as a soldier in what he believes to be an unrighteous cause, it is an act of moral turpitude; but when once enlisted, the soldier ceases to be morally responsible for the justice or iniquity of the war he wages; that rests with his employer. Obedience, implicit and entire, is his sole virtue. The maxim is, "The military force never deliberates, but always obeys." See ENLISTMENT, MARTIAL LAW, WAR, etc.

SOLDIERS' HOMES. The first institution of this character established by the U. S. government was founded by act of congress passed Mar. 3, 1851—"to found a military asylum for the relief and support of invalid and disabled soldiers of the army of the United States." The funds to conduct this institution originated in tribute levied by gen. Scott on the City of Mexico, after its capture, for the benefit of the U. S. army. The act referred to above defined the beneficiaries thereof to be soldiers who had served 20 years; pensioners, after surrendering their pensions; and persons disabled by wounds or sickness incurred in the military service of their country. Besides the sum of money already named, the act appropriated an unexpended balance of a previous appropriation to the same purpose, and placed the institution in charge of a board of commissioners, to include the gen. of the army and those general officers commanding the eastern

and western military divisions; and the chiefs of the medical, pay, commissary, and quartermaster's departments, and the adjt.gen. of the army. This portion of the act was revised by the act of Mar. 3, 1859, reducing the number of commissioners to include only the adjt.gen., surgeon-gen., and commissary-gen. of subsistence. Various temporary asylums were erected or leased between 1851 and 1857. In 1851 a purchase of land was made for this purpose in the city of Washington, distant about $3\frac{1}{2}$ m. from the capital; including, with later purchases, about 460 acres. This is, in fact, the only permanently established soldiers' home under the act of 1851. It comprehends a farm, orchards, gardens, park, etc.; the building is white marble, calculated to accommodate about 500 inmates at one time; and a chapel, well-stocked library, and hospital complete the excellent service of the institution. The number of inmates of this establishment up to the year 1878 was in the neighborhood of 2,000. Besides this one there were founded under the acts of 1865 and 1873 homes for volunteer soldiers of the war of 1861-65 in Chelsea, near Augusta, Me.; Hampton, Va.; Dayton, Ohio; and Milwaukee, Wis. Appropriations are made annually by congress for the support of these institutions. Similar institutions are the Chelsea hospital, Eng.; Kilmainham hospital, near Dublin; a like establishment in Berlin; and the hotel des invalides, Paris.

SOLDO. See **SOLIDUS**.

SOLE, *Solea*, a genus of flat-fishes (*pleuronectidae*), of an oblong form, with a rounded muzzle, which almost always advances beyond the mouth; the mouth twisted to the side opposite to that on which the eyes are situated, which is usually the right side, although individuals of the same species are found having the eyes and color on the left side; the teeth very small in both jaws, but only in the under part of the mouth (the *side* opposite to the eyes); the lateral line straight; pectoral fins on both sides; the dorsal and anal fins long, and extending to the tail, but distinct from the tail-fin.—The **COMMON SOLE** (*S. vulgaris*) is a highly esteemed fish, abundant on the British coasts where the bottom is sandy, and of which great quantities are brought to market. The London market is supplied chiefly from the s. coast of England, the soles there attaining a larger size than those of more northern coasts. They are caught by trawling, very seldom with bait. The sole is in condition for the table during the whole year except five or six weeks in February and March, its spawning-time. The common sole is found on all the coasts of Europe, except the most northern. It has been known to attain a size of 23 in. long, and almost 12 in. broad, weighing 9 pounds; but a sole of less than half that weight is reckoned very large. The upper side of the body is of an almost uniform dark brown; the scales small, rough to the touch, and ciliated at the edge; the lower side is white. The sole sometimes ascends rivers to a considerable distance from the sea, and seems to thrive at least as well in fresh as in salt water, a fact of which advantage has not yet been taken for the stocking of fresh-water ponds. It breeds freely enough in fresh water.—The only other British species of true sole is the **LEMON SOLE** (*S. pagusa*), which is sometimes taken with the common sole on the s. coast of England, and more rarely in more northern parts. It is paler in color than the common sole, and broader and thicker in proportion. It is equally esteemed for the table.—The name sole is popularly extended to several genera recently separated from the true soles. In *brachirus*, the dorsal and anal fins are united with the tail fin; but, as in *solea*, there are pectorals on both sides. To this genus belongs the **ZEBRA SOLE** (*B. zebrinus*) of Japan, remarkable for the zebra-like stripes which cross its whole body.—In *monochirus* the pectoral fin is developed only on the upper side. To this genus belong the **VARIEGATED SOLE** (*M. variegatus*) and the **LITTLE SOLE** or **SOLENETTE** (*M. linguatulus*), both found on the British coasts, but of little importance, on account of their small size.—In the genera *achirus* and *plagusia*, of which there are no British species, the pectorals are wanting on both sides.

SOL'ECISM. A solecism is the term applied to any violation of the grammar or idiom of a language, or of the usages of society. It is said to be derived from the city of Soli in Cilicia, whose inhabitants spoke very bad Greek, in consequence of their intercourse with the Cilician natives, and provoked the fastidious Athenians to coin the epithet.

SOLEMN LEAGUE AND COVENANT. See **COVENANTS**, **THE**, *ante*.

SO'LEN, a genus of lamellibranchiate mollusks, the type of the family *solenidae*, remarkable for the wide gaping of the shell at both ends, and the large and muscular foot. In the genus *solen* the shell is remarkably elongated, its apparent length being, however, more strictly its breadth. From its form the names **RAZOR-SHELL** and **RAZOR-FISH** are often given to it. The species are numerous, and inhabit the sands of all seas except in the coldest parts of the world. Some of the tropical species have shells of great beauty. The solens burrow in sand, making their hole straight down, and ascending and descending by means of their foot, which is capable of being elongated and contracted to bore a passage for the animal, and to drag it through. They are used for food and also by fishermen for bait. To obtain them a hooked iron implement is used. Another method is to drop a quantity of salt on the mouth of the hole, which causes them to come up, when they are quickly seized. The most common, and one of the largest British species, *S. siliqua*, is about an inch in length, and 8 in. in breadth. It is perfectly straight. Another common British species, *S. ensis*, is curved like a sword.

SOLENHOFEN LITHOGRAPHIC STONE, a famous deposit of limestone of upper oolite age, which from its fine-grained and homogeneous texture is admirably adapted for lithographic purposes. It occurs near Aichstadt in Bavaria, and has been extensively quarried since the invention of lithography. The quarrymen work upon the lines of stratification, which are beautifully parallel, and all the fossils are found upon the natural surfaces of the beds, and present an impression and cast in almost every instance. The rock is quarried to a depth of 80 or 90 feet. It is of special interest to the geologist from the singular assemblage of fossil remains which are preserved in it with wonderful minuteness. The most delicate tracery of the wings of the dragon-fly is often as perfect as in living specimens. The rock is of marine origin, and while lithologically it has a strong resemblance to the white lias of Britain, its fossils correlate it to the Kimmeridge clay. These are chiefly ammonites, nautili, crustacea, winged insects, fishing, and pterodactyles. But the most singular fossil is one which has only recently been brought to light. A single feather was first found, and some months after, the bones of a feather-covered animal, which was considered by its first describers to be a lizard, but prof. Owen has recently shown, on incontrovertible grounds, that it is a true though very anomalous bird. The specimen which, with the exception of the head, is almost entire, is now in the British museum. It has formed the subject of an elaborate memoir by prof. Owen, published in the *Philosophical Transactions*. He has named it *Archæopteryx maerura*. It is certainly the oldest bird of which any remains have yet been found, but the rocks which contain the numerous ornithic foot-prints in Connecticut valley (see ICHNOLOGY) are more ancient; the most careful examination has, however, hitherto failed to discover in them any indications other than the footprints. The *Archæopteryx* was about the size of a rook. The anomalous structure which induced the earlier observers to make it a reptile, and some that followed to imagine it as a transition form between the reptile and the bird, is the tail, which, instead of consisting of a few shortened vertebrae united together into a coccygean bone, as in all known birds, recent or fossil, was formed of twenty elongated vertebrae, each of which supported a pair of quill-feathers. But this departure from the bird type is not so anomalous as it at first sight appears, for in the early embryonic condition of the bird, the vertebrae are distinct and separate, and the anastomosis which invariably takes place in the subsequent development of the embryo, does not occur in the *Archæopteryx*, so that it may be considered to exhibit the temporary embryonic condition of the bird as a permanent structure; and that this is the true position of this singular fossil is further established by the existence of other features which are found only in birds. These are the ornithic structure of the wings and legs, the occurrence of feathers, which are confined to birds, and the existence of a merry-thought (furculum), which is found in no other class of animals. An elevation on the surface of the slab containing the fossil is believed by many to be the cast of the interior of the skull, and it corresponds remarkably in size and form with the cast from the skull of a rook.

SOLENT, the name of the western portion of the strait that intervenes between the isle of Wight and the main-land of England. At Hurst castle, which guards its entrance on the s.w., the Solent is less than a mile in breadth; and along this narrow passage the tide flows with a rapidity which at certain times no boat can stem. The castle itself consists of a central tower or keep, surrounded by several smaller towers, and mounted with heavy guns.

SOLEURE (Ger. *Solothurn*), a canton in the n. of Switzerland, bounded on the w. and s. by Bern, and on the n. and e. by Basel and Aargau. Area, 300 sq. m.; pop. '76, 77,803, mostly Roman Catholics. The greater portion of the canton is fertile and well cultivated, especially along the banks of the Aar. Even the rugged and hilly districts are sources of wealth on account of their fine pasturage. Besides grain, the principal products of Soleure are fruit, wine, flax, and cotton. Cherry-brandy is a very important article of trade. The manufacture of iron, glass, pottery, hosiery, and recently of watches, is carried on to a considerable extent. Soleure entered the Swiss confederation in 1481 along with Freiburg. Its constitution is liberal. The legislative body, or parliament, is the grand council, consisting of 106 members, the whole of whom are, since 1856, chosen directly by the people, who have besides a veto on the laws passed by the council. The executive is chosen by the council, and consists of five members.

SOLEURE. (Ger. *Solothurn*), capital of the canton, is situated on the Aar, 16 m. n.e. of Bern by railway. The scenery in its vicinity is among the loveliest in Switzerland. The Aar flows through the town, dividing it into two unequal parts, which are connected by two wooden bridges. The most notable building is the cathedral of St. Ursinus, with a cupola and façade of Corinthian columns, reckoned the most costly cathedral in Switzerland. Soleure has some manufactures, but derives its chief industrial importance from its transit-trade. Pop. '70, 7,054. Near to Soleure are the baths of Weissenstein.

SOLFATARA (Fr. *Soufrière*, Ger. *Scharcfelgrube* or *Scharcfelsee*), the Italian name for such volcanoes as, having become less active than volcanoes in an actual state of eruption, only exhale gases. The most notable of them are found in Italy, in the Antilles, in the interior of Asia, and in Java. The Solfatara of Pozzuoli, near Naples, is an irregular plain, 1368 ft. long, and 1310 ft. broad, almost surrounded by broken hills of pumiceous tufa, the ancient walls of the crater. From the crevices of the rocks, steam or

noxious gases, chiefly sulphureted hydrogen, mixed with a minute quantity of muriatic acid and muriate of ammonia, exhale. In the cracks and fissures of the rocks, sulphur, alum, and sulphate of iron abound. The vapors exhaled are used as medicinal baths, and huts, constructed of boards, have been erected in which the baths may be obtained. The Soufrière of Morne-Garon, in the isle of St. Vincent, Lesser Antilles, about three miles in circuit, and over 500 ft. in depth, has in its center a cone, the summit of which is covered with sulphur.

SOLFEGGIO, in music, seven syllables, which are sometimes used as a nomenclature for the seven notes of the scale. In singing, the art of applying these syllables to the notes as an exercise for the learner is called *solmization*. The syllables are *ut* (or *do*), *re*, *mi*, *fa*, *sol*, *la*, and *si*. The first six are the commencement of the lines of an ancient monkish hymn to John the Baptist, which had this peculiarity, that the first syllable of each line was sung to a note one degree higher than the first syllable of the line that preceded, so as to present the type of a scale:

These syllables are said to have been first made use of by Guido of Arezzo, in the 11th c.; and Le Maire, a French musician of the 17th c., added to them *si*, for the seventh of the scale. When applied to the key of C, their equivalents, in the ordinary musical nomenclature, are:

Do	re	mi	fa	sol	la	si	do
C	D	E	F	G	A	B	C.

These syllables may, however, according to the more modern practice of teachers in this country, be applied to other keys, with *do* always as the key note, so as to express, not the absolute pitch of a note, but its relation to the key-note; and thus used, they are thought to be of service to the learner in keeping prominently before him the principle that there is but one scale in music, which is raised or lowered according to the pitch of the key. Different variations in the way of using the syllables have recently given rise to various supposed short and easy modes of teaching singing, the best known of which is Mr. Curwen's system of "tonic solmization," where the ordinary notation of the staff, with its lines and spaces, is entirely rejected, and a notation substituted which is formed of the solfeggio syllables, used to express not pitch but relation to the key-note. One disadvantage of this and similar schemes is the entire withdrawal of the direct indication of the pitch of the sounds to the eye, by the notes ascending as the sounds ascend, which is so beautiful a feature of the common notation. And even if it be granted that the first rudiments of music can, as has been asserted, be taken up with remarkable ease by the pupil who learns on the tonic sol-fa system, it is undeniable that as soon as he comes in contact with notes of different lengths, or begins to modulate from one key to another, he is beset with serious difficulties. There is, in addition, the further objection to the system, that the pupil thus taught is shut out from the whole world of musical literature, a disadvantage which is not compensated by having a few elementary difficulties smoothed away, which experience shows that children of the most mediocre capacity can overcome.

SOLFERINO, a village of northern Italy, province of Brescia, 20 m. n.w. of Mantua, with 1400 inhabitants. It stands on a hill, and has a tower called the Spy of Italy (*Spia d'Italia*), from which the whole plain of Lombardy may be seen. There, in 1796, the French conquered the Austrians. On June 24, 1859, Solferino was again the scene of an overwhelming victory obtained by the French and Italians over the Austrians.

SOLICITOR. See ATTORNEYS.

SOLICITOR-GENERAL, the name given to one of the law-officers of the crown. The solicitor-general of England has powers similar to those of the attorney-general (q.v.), to whom he gives aid in discharging his functions. During the absence of the attorney-general, he may do every act and execute every authority of that officer. He is, *ex officio*, one of the commissioners of patents.

The solicitor-general of Scotland is one of the crown counsel, next in dignity to the lord advocate (see ADVOCATE, LORD), and exercising all his functions along with him. His office cannot be traced further back than the union. Like the lord advocate, he has the privilege of pleading within the bar. All proclamations for the observance of days of public fasting and thanksgiving are addressed to the solicitor-general.

SOLICITOR TO THE TREASURY, an officer who acts as attorney for the government in all legal proceedings. He has also to act as solicitor for the three secretaries of state, the privy council office, the board of trade, the mint, the war office, the stationery

office, and for all the other principal departments for which no solicitor is specially appointed.

SOLIDUNGULA. See *EQUIDÆ*.

SOLIDUS, the name by which the old Roman "aureus" (equivalent to £1 1s. 1½d., according to the present value of gold) was known after the time of Alexander Severus; but during the reign of Constantine the great its value was diminished in the ratio of 8:5, and so remained till the end of the empire. The weight of these later solidi was fixed at $\frac{1}{4}$ of an ounce, the gold being 23 carats fine, and the alloy mostly native silver. The "solidus," or "solidus aureus," was adopted by the Franks under the Merovingians and Carolingians (at 87 to the Roman pound) till the time of Pepin, who suppressed it; but another solidus of silver, or "solidus argenteus"—the $\frac{1}{6}$ of the libra or pound—which had been used only as a money of account, was soon after made a coin. In after-times, this "sol," or "sou," like all other coins, underwent an infinity of variations in fineness and value (see *LIVRE*). On the introduction of the decimal system (1793) into France, the sou was abolished, and a piece of 5 centimes ($\frac{1}{20}$ of a franc) substituted, but the name continued in common use, and the old sous were retained in circulation. The solidus also appears in the *soldo*, which was a coin in use in northern and central Italy, and was essentially the same with the sou.

SOLINGEN, a t. of Prussia, province of the Rhine, and government of Düsseldorf, capital of a circle of the same name, is situated on a height 13 m. e.s.e. of Düsseldorf, and not far from the river Wupper. It is a very old place, and has long been famous for its steel and iron ware manufactures, especially sword-blades, helmets, cuirasses, knives, scissors, which are exported to all parts of the world, and rival the excellence of English wares. In the town and circle of Solingen there are about 3,000 workshops, employing over 10,000 hands, and producing yearly half-a-million hand-bells, knives in millions of dozens, scissors, revolvers, etc. Solingen hand-bells have been famous since the middle ages, and are sent to the most distant lands. Pop., '75, 15,146.

SOLIS, ANTONIO DE, 1610-86, b. Spain; entered holy orders in 1637. He wrote several plays, of which *La Gitanilla*, "The Little Gipsy Girl," is the best known. His historical writings are of more importance, especially his *Historia de la Conquista de México*, (1684), which was translated into English by Townsend, 1724. He was long royal historiographer.

SOLIS, JUAN DIAZ DE, about 1470-1516, b. Spain. He accompanied Pinzon in his explorations, and in his company discovered Yucatan in 1506. Shortly afterward they explored the South American coast from cape St. Augustine to lat. 40° south. After their return to Spain, 1509, a quarrel between them resulted in the imprisonment of Solis, while Pinzon was in court favor. He was released, indemnified, and in 1515 made further explorations from cape San Roque to Rio de Janeiro, and discovered the La Plata. He was killed by the Indians.

SOLITAIRE, *Pezophaps*, a genus of birds of the Dodo (q.v.) family (*Didinæ*), but differing from the dodos in a smaller bill and longer legs. Like the dodos, the only species of this genus, of the existence of which there is any evidence (*P. solitaria*), seems to be now extinct, and to have become extinct in very recent times. It inhabited the island of Rodriguez, an island about 15 m. long by 6 broad, situated about 300 m. to the e. of Mauritius, and appears to have been peculiar to that small and lonely island, where it was abundant at the beginning of the 18th century. Rodriguez was uninhabited till 1691, when a colony of French Protestant refugees settled on it, under the command of François Leguat, who, in his *Voyages et Aventures*, has left an interesting and trustworthy account of the solitaire. He describes it as a large bird, the males sometimes weighing 45 lbs.; taller than a turkey, the neck a little longer in proportion, and carried erect; the head of the male without comb or crest, that of the female with something like a widow's peak above the bill; the wings small, and the bird incapable of flying, but only using the wings to flap itself or to flutter when calling for its mate, or as a weapon of offense or defense; the bone of the wing being thickened at the extremity so as to form a round mass, about the size of a musket-bullet, under the feathers, and to increase the force of the blow given by it; a roundish mass of feathers instead of a tail. He further describes the plumage as very full and beautiful, not a feather out of its place, so there can have been no feathers with unconnected webs, as in the ostrich. He says the bird is called solitaire because it is very seldom seen in flocks. He tells us that the bird is with difficulty caught in the forests, but easily on open ground, because it can be outrun by a man; and that its flesh is very good to eat.—But the solitaire seems to have completely disappeared from Rodriguez, which is now a British settlement. Bones have been found, although not yet abundantly, and some are preserved in the Paris Museum, some in the Andersonian Museum, Glasgow.

The figure here given is derived from a rude cut in Leguat's work, and its general accuracy is attested by its correspondence with small figures introduced in a landscape and two maps in that work.

The name solitaire was originally given to a species of dodo inhabiting Bourbon, and applied by Leguat to this bird, in a mistaken belief of its being the same. See *Strickland and Melville on the Dodo and its Kindred*.

SOLITAIRE, a species of game or rather puzzle, which, as the name denotes, is played by only one person. The apparatus for the game consists of a round or octagonal flat board, indented with 33 or 37 hemispherical hollows, and 33 or 37 balls, one in each hollow. The process of the game consists in removing one ball from the board, and then, having created a vacancy, capturing one of the balls adjoining by causing the one behind to leap over it into the vacant hollow; there are now two vacancies, and the game is continued in the same manner by capturing ball after ball, till only one remains, when the game is *won*. Should more than one be left, and they be so isolated as not to be liable to capture by each other, the game is *lost*. This puzzle may be solved in an immense number of ways; one of the prettiest modes consists in removing the central ball, and so capturing the others that the last ball shall be in the center.

SOLLER, a small town and sea-port of the Balearic isles, in Majorca, 14 m. n. of Palma. It exports oranges and wine, and contains 7,000 inhabitants.

SOLMIZATION. See **SOLFEGGIO**.

SOLO, a term used in musical compositions of several parts, whether vocal or instrumental, to indicate those voices or instruments that are to perform alone or in a more prominent manner, as *soprano solo*, *violino solo*. The plural *solis*, is used when two or more voices or instrumental parts are to be performed together, such parts, of course, never being double.—A composition for a single instrument accompanied is also termed a solo.

SOLO FRA, a small city of southern Italy, province of Avellino. Pop. 5,376. It is situated on the Apennines, and is surrounded by wooded mountains.

SOLOMON (Hebr. Shēlōmō, Salomon, Salomo, Suleimán, derived from *shalon*, peace = peaceful, like Germ. Friedrich), the second son of David and Bathsheba; successor of the former on the throne of the Israelitish empire for 40 years (1015-975 B.C.*). Nothing is known of his youth except that he was probably educated by Nathan (or Jehiel). Equally uncertain is the age at which he succeeded to the crown of his father. That he was older than 12 or 14 years, as some traditions tell us, seems certain. The way in which his succession to the throne during the lifetime of his father was brought about, to the exclusion of his elder brother Adonijah, is not undeserving of the name of *coup d'état*, which has been bestowed upon it (see the Scripture narrative). Having, by the execution of Adonijah and the leaders of his faction, secured his dominion against internal foes, he, with complete disregard of the Mosaic law, set himself to seek foreign alliances, and with this view married as his principal wife the daughter of Pharaoh, probably of Psusenes (Vaphres?), of the twenty-first dynasty. Besides her, however, he had a vast number of wives—700 “princesses,” and 300 “concubines”—the greatest part of whom were recruited from nations with whom an alliance had been strictly prohibited. Having inherited fabulous wealth, and further adding to it enormously from his own multifarious revenue, so that “silver was nothing accounted of in his days,” it became necessary that a new organization corresponding to this unheard-of splendor should be introduced. Accordingly, we hear of “princes,” i. e., great officers of state, not before heard of. The two counselors of David's time disappear, in order probably to make room for a whole body of legal advisers; the prophets are no longer to be found among the dignitaries of state, but new military charges are created instead. The immense accumulation of treasure also allowed the execution of a number of public works in Jerusalem, which now first assumed the magnificence and station of a capital. A new wall with fortified towers was erected around it; and the queen's palace—“the house of the forest of Lebanon”—with a long hall joined to it by a cedar porch, call the “tower of David,” outside of which a thousand golden shields were suspended, and within which the king sat, in all his imperial splendor, to pass judgment, were built under his immediate orders. His banquets, at which all the vessels were of gold; his tables, with their four (or forty) thousand stalls; his gardens and parks and summer retreats, were such as to dazzle even eastern fancy. Twelve commissaries, distributed in the different provinces, had each in his turn to furnish the means of sustaining this prodigious household. The dominion of Solomon extended from Thapsacus, on the Euphrates, to Gaza on the Mediterranean. The country was in the profoundest state of peace; the treasures accumulated by David appeared inexhaustible; and the popularity of the king, who listened to the meanest of his subjects; and gave judgment according to that wisdom, for which he had asked in his vision at Gibeon, in preference to any other gift, and which has remained proverbial from his day to ours, was naturally at first very great. Everything, moreover, was done to develop and increase the national wealth and welfare. The rich internal resources were developed, and commercial relations of the most extensive nature established.

Through the port established at Ezion Geber, at the head of the gulf of Elath, an outlet was gained to the Indian ocean; and the alliance with Phenicia, then under the sway of Hiram, gave an energetic impulse to these foreign expeditions. Manned with Tyrian sailors, the Israelite fleets went to “Ophir,” and brought back, in exchange for their own exportations, “gold and silver, apes and peacocks, ivory and spices;” and the

* There is some discrepancy among investigators about this date; the beginning of his reign being fixed variously at 1009, 1023, 990, etc.

rest of the strange and precious produce of India, Africa, Spain, and other regions, possibly even our own coasts.

According to his promise, Solomon, in the fourth year of his accession, commenced the building of the temple on Moriah, after the model of the tabernacle, wherein he was aided by Hiram, who not only sent him timber, but architects and cunning Phenician artists in wood and stone and metals. In the eleventh year of his reign it was completed, and solemnly inaugurated in the following year—at which occasion prodigious numbers of sacrifices were slaughtered. Thirteen years more having been spent in the construction of the "house of the forest of Lebanon" (the royal palace), other buildings and fortifications—among them that of Palmyra—are recorded to have been undertaken by the king, who, far from wishing further to extend his dominions, was only bent upon keeping his frontiers safe from the raids of the neighboring hordes, and for that purpose alone kept up an unprecedentedly large army.

The fame of Solomon could not but spread far and near. The splendor of his court and reign, heightened by his personal qualities, his wisdom and erudition—for he was not only the wisest but also the most learned of men—brought embassies from all parts to Jerusalem to witness his magnificence, and to lay gifts of tribute at his feet. The queen of Sheba's expedition and presents are well known; and as many Arab kings made him annual presents of a no less splendid nature, his income from different sources was calculated, in round numbers, at the enormous sum of 666 golden talents. That people of Moses, which was to know no other wealth than flocks and the fruits of the soil, had suddenly become a people of wealthy merchants, of soldiers, and of courtiers—and it did not profit by the change, chiefly through the bad influence of the king himself and his court. The army and the public buildings absorbed the resources of the provinces. In the Temple, erected for the purpose of the true worship of Jehovah, Solomon sacrificed three times a year; but nevertheless, to please his concubines, he allowed, and perhaps himself indulged in, the rites of polytheism on the heights, thereby setting the worst example to his subjects, sufficiently eager already to worship foreign deities. His exaggerated polygamy fostered immorality and licentiousness among the people; and, worst of all, the wise and gentle monarch, as his treasure got exhausted, began, toward the end of his reign, to lay the yoke, which hitherto had lain only on his Canaanite subjects, upon the Israelites themselves. And he thus became, to all intents and purposes, an eastern despot—selling part of his dominion to raise money, and trying to break the spirit of the nation by forced services and corporal chastisements.

Left by the "prophets," probably since his open and revolting infidelity with regard to the national worship, his advisers were chiefly insolent young courtiers, who awed even his aged counselors into silence, and from that time forth a storm began to gather over the land. The priests were on the side of the malcontents, and a vague talk of a general rising, which actually found utterance by a "prophet" in the face of Solomon, was heard throughout the country. Ahijah of Shiloh predicted, as Samuel had done to David, the partial dominion to the Ephraimite Jeroboam, who had to flee for his life to Egypt. But notwithstanding these internal mutterings, and the open revolts of one or two subject chiefs, such was the prestige both of David's and Solomon's name, that the king was allowed to die in peace.

Solomon has been supposed to be the author of Canticles (q.v.), Ecclesiastes (q.v.), Proverbs (q.v.), besides works on science which are said to be lost. But he is also to be considered the prime cause of the final and decisive downfall of the Jewish commonwealth for all historical times. His wisdom turned into folly, his justice into tyranny, raised a smoldering discontent which only awaited his death to break out into open flames of revolt and internal wars. His character presents the lamentable spectacle of genius gone astray; and many have been the discussions on the part of learned theologians in old and late times as to whether or not there was any hope of his "salvation." His name and his glory, however, will, notwithstanding the shadows that fall over his latter days, remain immortal, whether we look at the striking picture of him given in Scripture, or to the more gorgeous kaleidoscope of eastern legends revolving round the golden name of Suleiman: the lord and master of all animate and inanimate beings under the sun, the most beautiful, the most wealthy of all created men, and whose wisdom was as much without limits as were his riches and power.—See for such legendary accounts of Solomon, Weil's *Biblical Legends*, the *Targums*, the *Koran*, Lane's *Arabian Nights*, D'Herbelot, Ginsburg, Furst's *Pertenschnure Suleiman-Namch* in 70 books, ascribed to a Turkish poet, Firdusi, etc.

SOLOMON BEN GABIROD. See AVICEBRON.

SOLOMON BEN ISAAC, 1040-1105, b. France: better known as Rashi. He wrote commentaries on the Bible and the Talmud. His comments on the latter have been adopted in all editions of the book.

SOLOMON ISLANDS, a chain of Islands in the Malay or Indian Archipelago, between New Britain on the n.w. and the Queen Charlotte Islands on the s.e.; lat. 4° 50'—11° 50' south. Area estimated at 10,000 sq.m.; pop. thought to be considerable, but not ascertained. The natives are partly Negrilloes, partly Malays, and are still in the condition of savages.

SOLOMON'S SEAL, *Polygonatum*, a genus of plants of the natural order *liliaceæ*, differing from lily of the valley (q.v.) chiefly in the cylindrical tubular perianth, and in having the flowers jointed to their flower-stalks. There are three British species. The **COMMON SOLOMON'S SEAL** (*P. multiflorum*) is found in the woods and copses in many parts of England, and a few places in Scotland. It has a stem about two feet high, the upper part of which bears a number of large, ovate-elliptical, alternate leaves in two rows. The flower-stalks are generally branched; the flowers not large, white, and drooping.—The **NARROW-LEAVED SOLOMON'S SEAL** (*P. verticillatum*) is a rare British plant, only found in a few places in Scotland. The leaves are whorled.—The **ANGULAR**, or **SWEET-SMELLING SOLOMON'S SEAL** (*P. officinale*) is also rare in Britain, and is found only in England. It more nearly resembles the Common Solomon's Seal, but is smaller, and has greenish, fragrant flowers. All these species are common in many parts of Europe. They are very similar in their properties. The young shoots of *P. officinale* are eaten by the Turks like asparagus. The root is white, fleshy, inodorous, with a sweetish, mucilaginous, acrid taste. It contains *Asparagin*. It is a popular application to bruises, to prevent or remove discoloration, and its use is well known to those who are too apt to get a black eye now and then. A kind of bread has been made of it in times of scarcity. The berries are emetic and purgative.

SOLOMON'S SONG. See **CANTICLES**, *ante*.

SOLON, the most famous of all the ancient Greek lawgivers, was a native of Athens (b. about 638 B.C.), and belonged to one of the most distinguished families of Attica. His father, Exceestides, having seriously impaired his income by improvidence, Solon was obliged, while still young, to embark in trade. At first, however, Solon comes before us as an amatory poet. His earliest appearance in the field of politics was occasioned by the contest between Athens and Megara for the possession of Salamis. By force of artifice, Solon revived the martial spirit of his countrymen, which had sunk under the effect of repeated disasters, obtained command of a body of volunteers, and conquered the island (c. 593 B.C.), in which, along with others, he obtained a grant of land. Henceforth his public career is conspicuously noble and honorable. He figures as a wise and unselfish patriot, seeking earnestly, and not in vain, to compose the distractions, partly social and partly political, that rent his native city. The Athenians generally had thorough confidence in his integrity; and in 594 B.C. he was chosen archon or chief magistrate, and received unlimited permission to act as he saw best for the good of the state. In short, to borrow a phrase from Roman history, he was invested with dictatorial power. The nature and extent of the Solonian legislation has been the subject of much criticism in modern times, and Mr. Grote, in particular, has made it very clear that the "later ancients" (Plutarch and Diogenes Laërtius), on whom we are obliged to rely for almost all our information about Solon, are full of confusions, misapprehensions, and contradictions, and that it became a habit among them to mythically attribute to the great Athenian every bit of wise legislation whose paternity they could not discover.

In order to alleviate the wretchedness arising from the existing relations of debtor and creditor, which was no longer supportable, and was likely to create a social war, Solon proposed and carried a notable measure—the *seisachtheia*, or "disburdening ordinance" (from *seio*, to "shake off," and *achthos*, a "burden")—which received its name from its design—viz., to lighten the burden of debt that weighed down the *thetes*, or lower classes. How this was effected, is far from being correctly explained by Plutarch, and the reader who wishes to have the most rational solution of the matter must consult Grote's *History of Greece* (vol. iii.). From redressing the grievances of a class, Solon proceeded, at the solicitations of his countrymen, to remodel the constitution; and here, too, the qualities that are popularly associated with his name shine out conspicuously. Abandoning the semi-civilized theory which regards the nobles as alone worthy of citizenship, and of the honors of public office in the state, he introduced the timocratic, or rather the plutocratic principle—classifying citizens according to their wealth or property; the effect of which was not to wrest *all* power or dignity from the hands of the *eupatridæ*, or well-born class, but only to give a portion of it to others who might be as wealthy, and therefore, presumably, as intelligent and cultivated as they. Such a reform has been compared to that previously effected by Servius Tullius in the constitution of ancient Rome; and there is at least a striking resemblance in the method, if not in the design, of the two reforms. See **ROME**. Solon distributed the citizens into four classes. The first embraced all those whose yearly income reached 500 medimni; the second, those of between 300 and 500 medimni; the third, those of between 200 and 300 medimni, and the fourth, those whose income fell below 200 medimni. The first three classes were liable to *direct* taxation; the fourth not; but all were liable to *indirect* taxation. With regard to the *boule*, or deliberative assembly of four hundred, it would seem that Solon left it the strictly aristocratical body that he found it. Its power, however, was practically limited by a new *ecclesia*, or assembly of the four classes, whose ratification was necessary to all measures originating in the *boule*, or "upper house." On the other hand, the *ecclesia* itself could originate nothing, and thus the attic aristocracy and the attic plebs could mutually check each other's assumptions. The part of Solon's legislation relating to the industrial pursuits of the citizens appears to have been as

excellent and well considered as the rest, but the number of his special enactments is so great that we cannot afford space to mention them. It is enough to state that they embraced almost every subject of social importance; and the best testimony to their value lies in the fact, that when Peisistratos violently overthrew the political constitution established by his kinsman, he allowed his social legislation to stand. See **PISISTRATOS**.

The story of Solon's leaving Athens for ten years, after he had completed his labors as a lawgiver, and traveling into foreign countries, may be, and probably is historical, but the details are untrustworthy; and in particular, the celebrated incident of his interview with Croesus will not suit the requirements of chronology, and must be relegated to the domain of historic myths. During his absence, the old dissensions among the Athenians broke out, and when he returned, Solon struggled in vain to repress them. A strong hand, as well as a wise head, was needed, and the conspiracy of Peisistratos was quite as much one against anarchy as against the constitution. After Solon's defeat, he withdrew into private life, but occasionally assisted with his advice his bold, ambitious, and able kinsman, who had so effectively crushed the Athenian "disorderlies" of all parties. The date of his death is uncertain.

SOLOR' ISLANDS, **THE**, lie e. of Flores, between 122° 56' 30"—124° 25' e. long., and belong to the Netherlands residency of Timor. Besides several groups of smaller islands, they consist of Solor, with an area of 105 sq.m., and a pop. of 15,000; Adanara, 302 sq.m., pop. 36,000; Lomblem, 520 sq.m., pop. 120,000; and Pantar, 275 sq.m., with 60,000 inhabitants. Solor and Adanara are separated from Flores by narrow straits, Lomblem and Pantar lie in succession further east.

Solor has little cultivated land, the natives being good sailors, and chiefly employed in fishing. Much sulphur and saltpeter are found, from which gun-powder is made. The women weave coarse fabrics for clothing, and exotic cotton has lately been planted with success. Edible nests are extensively collected. In all the villages on the coast, markets are stately held, and numerous frequented. The natives near the sea are Malays, friendly to the Dutch, a few of them Christians, the others Mohammedans. Those of the interior are Alfoors, wild and warlike, who use shield and bow, sword and fire-arms. Adanara is governed by an independent rajah. It is a lovely island, having hills and dales, picturesque villages, and cultivated fields. The people are Malays, partly Mohammedans and partly Roman Catholics. Lomblem is also beautiful, the natives Malays; those of Pantar being Papuans.

The Solor islands are mountainous; the volcano Lobetolle, in Lomblem, is 4,914 ft. high; and the mountains of Pantar, 3,332. They are clothed to their summits with forests. In 1851 the Portuguese relinquished all claim to these islands, which are now governed by the military commander at Larantooka, in the e. of Flores; a Dutch post-holder being stationed at Lawajang, the chief place of Solor.

SOLSTICE (Lat. *solstitium*, from *sol*, sun, and *sto*, I stand), that point in the ecliptic at which the sun is furthest removed from the equator, and where he is consequently at the turning-point of his apparent course. There are two such points in the ecliptic, one where it touches the tropic of Cancer, the other where it touches that of Capricorn. The former is the summer, and the latter is the winter solstice to those who inhabit northern latitudes, and *vice versa*.—The term is also employed to signify the *time* at which the sun attains these two points in its orbit, viz., June 21 and Dec. 22.

SOLT, a t. of Hungary, county of Pesth, 48 m. s. of Pesth, in a marshy district on a branch of the Danube. Pop. '69, 5,696.

SOLUTION. A substance is said to undergo solution, or to become dissolved, when the force of adhesion between it and a liquid in which it is immersed is sufficient to overcome the force of cohesion between the solid particles. Thus sugar or salt is dissolved by water, camphor, or resin by spirit of wine, and silver by mercury. The liquid which effects the solution is termed the *solvent*, or sometimes the *menstruum*; and some solutions have special names—for example, the term *syrup* is applied to a solution of sugar in water, and *tincture* to a solution of a solid in alcohol. If a solid body be introduced in successive small portions into a definite quantity of a liquid capable of dissolving it, the first portions disappear the most rapidly, and each successive portion dissolves more slowly than its predecessor, until a point is reached at which the liquid ceases to possess any further solvent power. When this occurs the forces of cohesion and adhesion are balanced, and the liquid is said to be *saturated*. Solution is promoted by increasing the extent of surface in a solid, or by reducing it to powder. An elevation of temperature, by diminishing cohesion, will generally also increase the solvent power of the liquid; but there are exceptions to this rule—as for instance, in the case of lime and its salts, water just above the freezing-point dissolving nearly twice as much lime as it does when boiling. A compound of lime and sugar, very soluble in cold water, is separated from the solution almost completely if heated to boiling. But the most remarkable case of the kind occurs in sulphate of soda (Glauber's salt), which in its crystalline form dissolves in about ten times its weight of ice-cold water, and rapidly becomes more soluble as the temperature rises until it reaches 91°; from this point until the solution boils the solubility slightly decreases, the boiling liquid only retaining about four-fifths of the quantity which was dissolved at 91°. Carbonate and seleniate of soda, and sulphate of iron,

exhibit the same peculiarity in a less marked degree. "These anomalous results may be partly explained," says Dr. Miller, "by the consideration that heat diminishes the force of adhesion as well as that of cohesion. Generally speaking, cohesion is the more rapidly diminished of the two, although not uniformly so; and in these cases it would appear that the adhesive force decreases in a greater ratio than the cohesion of the saline particles" (*Chemical Physics*, 3d ed. 1863, p. 72). The accompanying diagram shows the

unequal solubility of various of the more common salts in water of different temperatures. The lines of solubility cut the verticals raised from points indicating the temperature upon the lower horizontal line, at heights proportional to the quantities of salt dissolved by 100 parts of water. For example, 100 parts of water dissolve—at 32°, 8 parts, at 122°, 17 parts, and at 212°, 26 parts of sulphate of potash. Water which has been saturated with one substance—that is, which refuses to dissolve any more of that substance, will often continue to dissolve others.

In true or simple solution the properties, both of the solid and the solvent, are retained. When, however, any chemical action ensues between the solid and the liquid, the resulting solution commonly presents perfectly new and distinct features; as, for example, when the metals are dissolved by acids, or oils by the alkalis (as in soap-making). For the solubility of the gases in water we must refer to the article GASES.

The uses of solution in laboratory processes are numerous. By the difference in degree of their solubility we can separate one substance from another; and by dissolving a body we can purify it, either by filtration or crystallization. Moreover, when it is forced that two bodies shall react on one another, they do so with incomparably more force in their dissolved than in their solid state.

SOLVENT. See SOLUTION.

SOLWAY FIRTH—in its upper part best regarded as the estuary of the river Esk; in its lower, as an inlet of the Irish sea—separates the n.w. of Cumberland from the s. of Scotland. Its entire length, until lost in the Irish sea, is calculated at 33 m.; its average breadth for the first 12 of these is not more than 2½ m., but afterward it gradually, although irregularly, increases to upward of 20. The principal rivers flowing into it, besides the Esk, are the Annan, Nith, Dee, and Urr, from the n. or Scottish side; and the Eden and Derwent from the s. or English side. The most striking feature of the Solway firth is the rapidity with which its tides ebb and flow. The spring-tides are peculiarly swift and strong—the wave rushing in from 3 to 6 ft. high, and at the rate of 8 to 10 m. an hour, occasionally inflicting serious damage on the shipping; while after it has retreated, great stretches of the bed of the firth are left bare, and in some places one can even cross over from the English to the Scottish shore. The salmon-fisheries of the Solway are valuable.—*Solway Moss* is a district of Cumberland about 7 m. in circumference, lying w. of Longtown, and immediately adjoining Scotland. As its name implies, it was once a bog, but is now drained and cultivated. It is historically notable as the scene of a battle between the English and Scots in 1542, when the latter were defeated. Here also, on Nov. 13, 1771, an extraordinary disaster occurred. The boggy ground, surcharged with moisture—the effect of heavy rains—rose, swelled, and burst like a torrent, sweeping along with it trees and houses, and destroying some 30 small villages.

SOLYMAN (SULEIMAN) II., surnamed "THE MAGNIFICENT," the greatest of the Turkish sultans, was b. in 1496; and in Sept., 1520, succeeded his father, Selim I. (q.v.), who had carefully initiated him into the secrets of Ottoman policy. At the commencement of his reign, he restored a large amount of unjustly confiscated property, and removed from office all who were unfit for the proper discharge of their duties. After having suppressed the revolt of the governor of Syria, he exterminated the Egyptian Mamelukes, and concluded a treaty with Persia. The foolish insolence of the Hungarian court next drew him thither with a powerful army, and Belgrade, the key of that country, was captured (1521). He next drove the knights of St. John from Rhodes (1522); and for 3 years following devoted himself to improvements in the administration; but his attempts at military reform provoked a rebellion of the janitaries, which he saw no other means of quelling than by engaging them in a war with Hungary. He gained the

signal victory of Mohacz (1526), and continuing his resistless course, took Buda and Pesth; but he was recalled by the news of a rebellion in the e., and retreated down the Danube to Constantinople, committing frightful ravages on the way. In 1529 he was summoned to Hungary in aid of his protégé, king John Zapolya, who was contesting the crown with Ferdinand, and accordingly invaded that country with a mighty army, capturing and destroying as he went, and laid siege to Vienna, but after various unsuccessful assaults, he was compelled to retreat. Two years afterward (1531), he again appeared in Hungary; but his progress this time was checked by Charles V. in person, who had come with the imperial army of 250,000, in aid of his brother. In 1535 he concluded with Francis I. the famous treaty which opened the commerce of the Levant to the French flag alone. In 1540 the long and desultory contest between the Turks and Imperialists for Hungary was ended in favor of the former, who took complete possession of the country. After this, the alliance between the French and the Turks began to bear fruit; the combined fleets ravaged the Italian coasts, and pillaged Nice (1542); but peace was again restored with Germany in 1547. The Turks were now supreme in the Mediterranean; Gozzo and Tripoli fell into their hands, and the conquest of the Banat of Temeswar (1551) assured them a firm hold over Hungary. A second and third war with Persia, which was now in a state of semi-subjugation, the bloodthirsty ambition of his favorite wife Roxolana, who succeeded in persuading him to put to death the children of his other wives, a brilliant naval victory (1561) over the knights of Malta and their allies the Spaniards, an unsuccessful blockade of Valetta in Malta (1565), and a fresh expedition to Hungary (1566), were the chief events of the remainder of his reign. During this last expedition, while besieging the little town of Szigeth or Szegedin, which resisted all his attacks, he died on Sept. 5, 1566.

SOMA ("the moon-plant," or *asclepius acida*) is, in the Vedic hymns, the god who represents this plant, and one of the most popular deities of the Vedic religion. The reason for this popularity must be sought for in the important part which the juice of the Soma-plant played in the great Vedic sacrifices, and probably also in its alcoholic and invigorating properties, which the sacrificer experienced when he drunk of it in the exercise of his functions. These properties are constantly described or alluded to in the hymns addressed to Soma. Thus, in some hymns, Soma is said to exhilarate Varouna, Mitra, Indra, and the other gods who partake of its juice; and in another, the worshippers exclaim: "We have drunk the Soma; we have become immortal; we have entered into light; we have known the gods. What can an enemy now do to us, or what can the malice of any mortal effect?" In other passages, the juice of the Soma is said to be a draught of immortality, medicine for the sick, and a remedy for blindness and lameness. Thus Soma became endowed with supernatural qualities and divine attributes, and gradually was exalted as one of the most powerful deities. He is the friend, helper, and soul of Indra; he is the slayer of the cloud-demon Vritra, the destroyer of foes, the dispeller of darkness, the creator of the sun, the upholder of the sky, and the sustainer of the earth, the king of gods and men; he is thousand-eyed, the most heroic of heroes; he is wise, strong, energetic, etc. See the interesting article on Soma by John Muir, in his "Contributions to a Knowledge of the Vedic Theogony and Mythology," in the *Journal of the Royal Asiatic Society*, new series, vol. i. pp. 135. ff. In the classical period of Hinduism, Soma ceases to be worshiped in the character which he has at the Vedic period; he then becomes the god of the moon. This transition from Soma, the plant and its juice, to Soma, the moon, which is perceptible even as early as in the Sâtapatha Brâhmana of the White Yajurveda (see VEDA), is apparently due to the belief, that *Amṛita*, the beverage of immortality, was guarded by the moon, and to the circumstance that, in the Vedic hymns, Soma is frequently called or described as *Amṛita*. The myths connected with Soma, the moon, are wholly different from those relating to the Vedic Soma. As moon, Soma was born from the eyes of Atri, a son of Brahman, the first god of the Trimûrti (q.v.); and became installed by Brahman as the sovereign of plants, Brâhmanas, and planets. But after he had acquired extensive dominion, he became arrogant and licentious, and carried off Târâ (lit., a star), the wife of Vṛihaspati, the preceptor of the gods. Vṛihaspati seeking to recover his bride, and some of the gods siding with him, and others with Soma, a war broke out, which ended in Târâ's being restored to her husband. The result, however, of her stay with Soma was the birth of a son named Budha, who became the ancestor of a dynasty of kings, called the lunar dynasty. See SÛRYA.

• **SOMALI LAND**, or SOMAULI, an extensive maritime country in the e. of Africa, is triangular in shape, and is bounded on the n. by the gulf of Aden, on the s.e. by the Indian ocean, and on the s.w. by the Jub river. From the middle course of the Jub to cape Guardafui, which forms the apex of the triangle, the distance is nearly nine hundred miles. The area of the country is estimated at 330,000 sq.m.; but as great part of its interior still remains unexplored, the number of its inhabitants has not been ascertained. The land is elevated and mountainous in the n. and slopes in terraces toward the south. The Jub, which forms the s.w. boundary, is a large fertilizing stream, drawing its waters from the mountains of southern Abyssinia, and flowing s.e. between the territories of the Gallas on the w. and those of the Somali on the e., to its mouth on the northern frontier of Zanzibar.

The present Somali race were originally Arabs, who landed on the African shore s. of the gulf of Aden early in the 15th century. Driving back the earlier inhabitants of the country, who were Christians, the Moslem made themselves masters of the country. The inhabitants are extremely violent and quarrelsome in their disposition, are notorious for cheating and lying, and for the most part pursue a wandering, pastoral life. The chief trading place is Berbera, on the n. coast; and the products of the country are sheep, cows, ghee, grass-made mats, ostrich feathers, and hides. These are exchanged at the ports for cloth, dates, rice, beads, and iron.—*What Led to the Discovery of the Nile*, by Capt. Speke (Edin. 1864).

SOMATOL'OGY. See MATTER; ATOM; ATOMIC THEORY; FORCE, CONSERVATION OF; PERCEPTION; *ante*.

SOMBRERETE, a t. of Mexico, in the state of Zacatecas, and 90 m. n.w. from Zacatecas, in a mountainous district celebrated for its rich silver mines from which Sombrerete derives all its importance. Pop. 14,000.

SOMERS, JOHN, Lord, 1651–1716; b. Worcester, England; graduated at Trinity college, Oxford; became a lawyer, 1676, pursuing at Oxford classical, historical, and judicial studies; commenced practice at London, 1682, and became a leader of the whigs; of counsel for the seven bishops, 1688; member of "Convention Parliament," and solicitor-general, 1689; attorney-general, 1692; keeper of the great seal, 1693; a lord justice, 1695; lord chancellor and raised to the peerage, 1697; removed from chancellorship, 1700, and arraigned for trial before the house of lords, but prosecution having been withdrawn, recovered his influence at court, and was chosen president of the Royal society, 1702; president of the council, 1708–10; and spent the remainder of his life in comparative retirement.

SOMERSET, a co. in w. Maine, adjoining Canada; drained by the Walloostock, Penobscot, and Kennebec rivers; traversed by the Somerset and the Maine Central railroads; about 3,800 sq.m.; pop. '80, 32,329—31,065 of American birth. The surface is in part hilly, and there are extensive forests from which much lumber is taken for export. Co. seat, Skowhegan.

SOMERSET, a co. in s.e. Maryland, bounded on the n. by the Wicomico river, on the s.e. by the Pocomoke river, and on the w. by Chesapeake bay; crossed by the Eastern Shore railroad; about 375 sq.m.; pop. '80 21,688–8,637 colored. The surface is level and heavily timbered. The soil is sandy. The principal productions are corn and oats. Co. seat, Princess Anne.

SOMERSET, a co. in central New Jersey, bordered by the Passaic on the n.e., and on the w. by Lamington river; crossed by the New York and Philadelphia, the Central New Jersey, and Lehigh Valley railroads, and by the Delaware and Raritan canal; drained by the Passaic and Millstone rivers, and by branches of the Raritan; 275 sq.m.; pop. '80, 27,161. The surface is partly hilly and the soil fertile; the principal products are wheat, corn, potatoes, oats, wool, flax, butter, and cattle. It has good water-power and contains manufactories of agricultural implements, castings, and pig-iron; also tanneries, distilleries, flour and saw mills. Co. seat, Somerville.

SOMERSET, a co. in s.w. Pennsylvania, adjoining Maryland; drained by the Youghiogheny and Castleman's rivers; traversed by the Pittsburg, Washington and Baltimore railroad; about 1000 sq.m.; pop. '80, 23,146—31,706 of American birth. The surface is hilly, but very fertile; flax, wheat, rye, potatoes, corn, butter, and maple sugar are staples; sheep grazing is extensively carried on. Iron ore, bituminous and cannel coal are found. Co. seat, Somerset.

SOMERSET HERALD. See HERALD.

SOMERSET HOUSE, in the Strand, London, stands on the site of a palace built by the protector Somerset about 1549, which fell to the crown on Somerset's execution. The original Somerset House was pulled down and rebuilt in 1776, after designs by sir William Chambers, in the Palladian style for public offices. Various offices connected with the navy and other public departments were removed there in 1788; and in 1813 the east wing was completed to form King's college.

SOMERSETSHIRE, a maritime co. in the s.w. of England, is bounded on the n.w. by the Bristol channel, and in other directions by Devonshire, Dorsetshire, Wilts, and Gloucestershire. Area, 1,049,815 acres. Pop. '71, 463,483. Its form is oblong, its length being about 80 m., and breadth about 36. The surface is extremely diversified, there being every variation, from lofty hills and barren moors to rich vales and marshy "levels," many thousands of acres of the latter being below high-water mark, and depending for security on sea banks and sluices. The hills are divided into several ranges running from e. to west. One range, known as the Mendips (q.v.), runs from near the city of Wells to the coast at Bream-down. South of these hills is a vast marshy plain, on which the Polden hills stand out abruptly like an island. Another conspicuous group, called the Quantocks, rise near Taunton and attain a maximum elevation of 1270 feet. And finally, in the extreme w., is the wild district of Exmoor forest, composed almost entirely of barren hills, the highest of which, Dunkery beacon, is 1668 ft. above the sea level. The rivers of the county rise chiefly in these high grounds, and

are none of them of any magnitude except the Bristol Avon, which rises in Wiltshire, and for some miles divides Somersetshire from Gloucestershire. The Parret drains the middle districts and is a tidal stream up to Bridgwater, presenting at spring-tides the peculiar phenomenon called the "bore." The soil is mostly fertile, and the pasture-lands are almost unrivaled for their luxuriance. The wheat and barley grown around Bridgwater are famous; but grazing and dairy farming form the great objects of husbandry, and the cheese of Cheddar has a great reputation. Cider is also produced in enormous quantities, but owing to the prevalence of small farms agriculture is in a backward state. The hilly districts are rich in minerals, especially iron, with some lead and calamine; and the Radstock and Bedminster coal-fields supply the northern districts with excellent fuel. Oolite is largely developed in the neighborhood of Bath, where a beautiful building-stone is extensively produced. The principal manufactures are woolen cloth, coarse linens, lace, silk, and gloves; but these industries are not progressive, and the population of Somersetshire is diminishing largely in the rural districts. The medicinal springs are an important feature of the county, having been the means of bringing into celebrity and sustaining the splendor of Bath (q.v.). Weston-super-Mare, containing at the beginning of the century a few hovels, is now one of the finest watering-places on the western coast. Somersetshire is divided into three districts for electoral purposes, and returns six members to the house of commons. The parliamentary boroughs are Bath, Taunton, and Frome—Bridgwater having been recently disfranchised for corrupt practices. In ancient times this part of the kingdom was inhabited by the *Belgæ*, and the Mendips appear to have formed so strong a barrier against the Roman and Saxon that even to this day philologists can trace the strong Celtic element that held its ground here. British camps are very numerous on the hills, and extensive remains of stone circles are visible at Stanton Drew, near Bristol. In Saxon times Somersetshire was one of the earliest counties to embrace Christianity; and while a church was founded at Wells in 704, on the site now occupied by the fine cathedral, a monastery was founded at Glastonbury, which eventually became one of the wealthiest in the kingdom. Somersetshire was the principal arena of the rebellion of the duke of Monmouth in 1685.

SOMERS ISLANDS. See BERMUDAS, *ante*.

SOMERVILLE, a co. in n.e. central Texas, drained by the Brazos river; 300 sq. m.; pop. '80, 2,649—2,629 of American birth, 28 colored. This county was set off from Hood co. in 1875. The surface is a rolling prairie; cotton, corn, and wheat are raised. Co. seat, Glen Rose.

SOMERVILLE, a city in Middlesex co., Mass., on Mystic river, and on the Boston and Albany, the Boston and Maine, and the Eastern and Fitchburg railroads; 3 m. from Boston; pop. '80, 24,985. It was separated from Charlestown in 1842, and incorporated as a city in 1872. It is divided into 4 wards, and governed by a mayor, aldermen, and councilmen. It has 3 lines of street railroads, an electric fire alarm, a paid fire department; is furnished with water from the Mystic river, and lighted with gas. The city has numerous hills, of which Central, Spring, and Winter are the highest; also a public park of about 16 acres in the n.e. portion. It is principally a place of residence for Boston merchants. It contains numerous public schools, a free public library, the McLean insane asylum; and manufactories of steam-boilers, carriages, glass, and earthenware, brass and copper tubing, an iron-foundry, dye-works, brick yards, a bleachery, and an establishment for currying leather.

SOMERVILLE, Mrs. MARY, a lady famed for her mastery of mathematics and physical science, was the daughter of admiral sir William Fairfax. She was b. at Jedburgh on Dec. 26, 1780, and brought up at Burntisland, amid somewhat narrow family circumstances. Her mother taught her to read; but besides this, she had no education till she was nine years old. At ten, she went for a year to a school at Musselburgh; and on her return, took more delight in reading whatever came in her way than in sewing, to the great discomfort of her relatives. After she was thirteen, she twice had, during a sojourn in Edinburgh, an opportunity of attending classes, studying music, drawing, and a little Latin, and of mixing with Edinburgh society. It is somewhat singular that it was in an algebraic sum in a magazine of fashions that Mrs. Somerville first made her acquaintance with the subject that most engrossed her attention later in life. In 1804 she married Mr. Greig, a commissioner in the Russian navy, and removed to London. Although Mr. Greig did not prevent her from continuing her studies, he himself had no interest in science, and had the usual prejudices against learned women. It was not till her return north as a widow, after three years of married life, that she was free to buy the books she wanted, and to study the subject that most interested her. She was now 33 years old, with two children. In 1812 she married her cousin, Dr. William Somerville, who entered warmly into all her ideas. Her husband and she removed to London in 1816, where Mrs. Somerville went much into society, and became known as possessed of scientific interests and gifts. In 1823 Mrs. Somerville was invited by lord Brougham to try to popularize, for the English public, Laplace's great work, the *Mécanique Céleste*. This she was persuaded to undertake, and published it as the *Celestial Mechanism of the Heavens*, in 1830. The work was received with the greatest admiration. Mrs. Somerville was awarded a royal pension in 1855. *The Connection of the Physical Sciences* was

published in 1835, and has passed through nine editions. Her next work was *Physical Geography* (1848), of which there have been six English editions. *Molecular and Microscopic Science* appeared in 1866. Mrs. Somerville, who for many years resided in Italy, died at Naples, Nov. 29, 1872, having maintained till the end the perfect use of her faculties. An autobiography, edited and supplemented by a daughter of Mrs. Somerville, was published in 1873.

SOMERVILLE, WILLIAM, 1692-1742, b. Warwickshire, England, of good family; educated at Oxford university. He afterward resided on his ancestral estate as a country squire and wrote *The Chase and Field Sports*, both poems, and also fables and tales of some merit.

SOMMA, a t. of southern Italy, at the northern base of mount Vesuvius. Pop. 7,400.

SOMME (anc. *Somara*), a river of northern France, rises near Font-Somme, in the department of Aisne, and falls into the English channel midway between Boulogne and Dieppe. Its entire length is about 120 m., of which one-half is navigable.

SOMME, a maritime department in the north of France, s. of Pas-de-Calais, and n.e. of Seine-Inférieure. It has an area of 2,377 sq.m., and a pop. 76, of 556,641. Somme is for the most part quite level, and in some parts marshy. The department produces abundance of corn and garden-fruits; also beet-root, oil-yielding plants, and splendid carrots. The rearing of cattle is carried on to a great extent. The chief manufactures are velvets, woolens, cottons, linens, silk, leather, and tapestries.

SOMNAMBULISM (Lat. sleep-walking). Walking in sleep is the most palpable, but not the most marvelous characteristic of this condition. The person affected walks, rides, climbs, with the eyes shut or insensible; his movements are precise, cautious, leading him into positions of difficulty and peril, which, if perfectly alive to their real nature, or if acting under the influence of ordinary motives, he would avoid; and yet there appears to be a partial consciousness of surrounding objects, and an adaptation to circumstances. Individuals have, while in this state, performed long journeys on foot or horseback, paying tolls, avoiding obstacles; they have successfully descended into coal-mines; they have ascended in safety to the roofs of houses, have climbed rocky cliffs, and successfully robbed eagles' nests, during the night; millers, saddlers, grooms, seamstresses, have all performed their customary work with perfect exactitude, but without any recollection of their exertions or industry. Notwithstanding the accuracy with which many acts are performed, that particular senses may be dormant is proved by insensibility to loud noises, and by a cook eating cabbage which had been substituted for a salad which he had carefully and artistically prepared. The senses, in relation to the idea or train of ideas present to the mind, appear to be awake, and preternaturally acute. This fact has suggested the hypothesis, that certain faculties are wakeful, open to impressions, and actuated by volition; while others, and the mind in general, are plunged in profound sleep and unconsciousness. This may be true, and is in harmony with the opinion, that the phenomena are an acted dream or delusion, and that what is seen, heard, or done, is the mere embodiment or repetition of former impressions or impulses, at the time before the mind. This may be illustrated by the case of the student narrated by the archbishop of Bordeaux, who composed a sermon and wrote out music while asleep; read them over, made corrections, scratched out lines, substituted others, put in its place a word that had been omitted, and continued to do all this, although a sheet of pasteboard was interposed between the writing and his face; showing that he was copying mental images, and not with the eye.

Somnambulism occurs in the sensitive and excitable, often in conjunction with other nervous affections, and is hereditary; so that it may be regarded as on, if not within, the boundary of disease.—Herbert Mayo, M.D., *On the Truths contained in Popular Superstitions*; Macnish, *Philosophy of Sleep*; Binns on *Sleep*.

SOMNAMBULISM, ARTIFICIAL. See **HYPNOTISM**, *ante*.

SOMNAUTH, or **SOMNATH-PUTTEN**, a t. of Guzerat, in Hindustan, is situated on the s.w. coast of the peninsula of Kattywar (q.v.), about 33 m. from its southern extremity, and has at present a pop. of 5,000 most of whom are Mohammedans. The town is fortified by a strong stone wall 9 ft. thick, strengthened by 38 towers; it contains many mosques, and the ruins of the celebrated Hindu temple of the idol Somnauth. The ruins of the temple are in a state of fair preservation, and give the idea of its having been a gloomy, massive temple in the form of an oblong hall 96 ft. by 68 ft. crowned by a magnificent dome, and covered on the inside and outside with elaborate sculpture and carving illustrative of mythological subjects. The splendor of this temple has doubtless been much exaggerated by various travelers; but a thousand years ago it was so famous as a place of pilgrimage for pious Hindus, as well as for its immense wealth—the accumulations of centuries of presents—that it attracted the zealous idol destroyer, Mahmud of Ghizni, after he had accomplished his self-imposed mission of conquest, spoliation, and conversion in the rest of northern India. In 1024 he appeared before Somnauth drove its defenders—who at first had been buoyed up with sanguine hopes that their favorite god had drawn the Mohammedans hither that he might blast them with his wrath—to take refuge in the temple, where they defended themselves with such valor that Mahmud's army was forced to retreat; but the sub-

sequent rout of two Hindu armies which had advanced to the aid of the sacred city, so dispirited the defenders that Somnauth was immediately surrendered, the idol destroyed, and the enormous wealth of the temple, consisting chiefly of precious jewels, carried off along with the gates of the temple. These gates, which are said to have been made of sandal-wood, were brought back from the entrance to Mahmud's tomb in Afghanistan by the British in 1842, and their recovery announced in a magnificent proclamation, which called upon the chiefs of Sirhind, Rajputana, Malwa, Guzerat, to transmit them "with all honor" to the place whence, eight centuries ago, they had been violently removed. They were, however, never restored to Somnauth, as the home authorities disapproved of the tenor of the proclamation, fearing that it might stimulate religious animosity between the two great religious bodies of Hindustan. There was also reasonable ground of doubt as to whether the gates were really the original gates of Somnauth and even whether (since the *Ferishtah* does not mention the circumstance) Mahmud had taken away any gates. The repute of Somnauth as a place of religious pilgrimage, and its wealth, revived some time after its spoliation by sultan Mahmud, to such an extent as frequently to attract the various Mohammedan robber-princes of western India; and it is still at the present day a chief resort of pious Hindus from all quarters, who pay a small tribute to the Guicowar for liberty to perform their devotions at this favorite shrine.—See Price's *Mohammedan History*, vol. ii.; Dow's translation of the *Ferishtah*; Mirkhond's *Rauzat-al-safa*; sir John Malcolm's *History of Persia*, vol. i.; and Smith's *Life of Dr. John Wilson* (1878).

SONATA, a musical composition for a solo instrument, sometimes accompanied by one or two other instruments, consisting of three, four, or even more movements; these movements usually consist of a subject or subjects, given out first in the key of the dominant, and after certain episodes, in which these themes are presented in a great variety of aspect, they are repeated in the key of the tonic. This form is in general most closely adhered to in the first movement of a sonata, and exhibits great room for a display of the inventiveness and musical resources of the composer. The second movement is generally slower and shorter than the rest, and often in the form of a theme with variations. The most important compositions of this kind are for the piano-forte, many of which have been written by Haydn, Mozart, Beethoven, Clementi, Dussek, and other masters.—A short sonata with two, or at most three movements, less elaborately worked, is called a *sonatina*.

SONCHUS. See **SOW THISTLE**.

SONDERSHAUSEN, the chief t. of the principality of Schwarzburg-Sondershausen, pleasantly situated on the Wipper, 36 m. n.w. of Weimar. Pop. '75, 5,723.

SONDRIO, a province in Lombardy, Italy; bounded by Switzerland on the n., Tyrol on the e., and Como, Brescia, and Bergamo on the s., drained by the Adda river; 1262 sq.m.; pop. '72, 111,241. The valleys of Valtellina, 45 m. long, and Chiavenna, form the greater part of the province. Some of the loftiest summits of the Rhetian Alps, are on the n. boundary, and include the celebrated passes of Splügen, Bernina, and Stelvio, the last being the highest, over which carriages pass. Excepting the marshes bordering lake Como, the soil is fertile, yielding fine crops of grain and fruit, particularly grapes, which are manufactured into wine. The Sondrio cheese is particularly fine. The province contains iron and marble. Capital, Sondrio.

SONG, a short poem adapted to a vocal melody. The word is generally applied to the poetical and musical composition in union, but sometimes to one or other separately. The poem generally turns on some single thought or feeling, and is divided into portions of returning measure. The term song, properly implying an air of a simple kind, is often, though not very correctly, applied to the elaborate *aria* of the opera, or the solemn air of the oratorio. A song generally implies an air for a single voice—airs for more than one voice being, however, sometimes called part-songs. England produced in the course of last century a large number of beautiful songs. Of the numerous songs which are continually appearing in this country at the present day, extremely few have musically much merit, and in a large proportion of cases the words are of a silly and insipid description. Germany has of late produced a larger proportion of beautiful songs than any other country. Among songs, not the least interesting are the national and popular airs of different countries, generally of uncertain date, and almost always possessed of much character.

SONG OF BIRDS. All birds have some voice or cry which they utter, and most of them various notes appropriate to various occasions. The power of producing clear and sweet musical notes is chiefly found in certain families of the order *insectores*; some of which, as the lark, pour forth their song in the air; but the greater number, like the thrush and nightingale, sit while they sing. The compass and variety of notes, the power of trilling and shaking, the loudness, clearness, and sweetness of the song, differ very much in different species, each of which may be as perfectly recognized by its song as by its form or plumage. There are also, as is well known, great differences among individuals of the same species, and Mr. Jesse asserts his confidence that there are notable differences between the song of the birds of the same species generally in one district and in another, just as there are provincial dialects and modes of pronunciation in human

speech. "The song, for example, of a thrush near London, or in any of the home counties, has little resemblance, except in specific character, to that of the same bird in Devonshire or near Exeter. The same notes, I suppose, will all of them be detected, but they are arranged for the most part into a different tune, and are not sung in the same way. They are given with different values, and the singing is pitched in a different key. One great distinction between the two cases is the number of guttural notes of which the song of a Devonshire thrush is often made up, but which near London are heard only at the end of a bar, or even much less frequently; while those chief notes, which mainly constitute the song of the other bird, and make it so impressive, are rarely pronounced by the Devonshire thrush." *Scenes and Occupations of Country Life*, p. 112.

The singing of birds is chiefly connected with the love-season; although some birds sing at other seasons also, during fine weather, and when food is abundant, as if merely to utter their happiness, and by uttering, to increase it. It is during the pairing-time that they are most vocal; the singing of many is continued with frequency also during the period of incubation, but with some change of character, exhibited in a marked degree by the chaffinch. The male alone sings. Female birds have voice also, but do not, possess the power of warbling like their mates. There are generally considerable anatomical differences in the larynx of the two sexes.

There can be no doubt that the singing of the male bird is intended to attract and please the female, and that he delights in this display of his own powers. In this respect, there is no difference between the birds of most melodious song and those of harsh discordant voice. The crowing of the cock and the gobbling of the turkey have the same purpose as the song of the nightingale. In them may be also seen an emulation which is ready further to display itself in combats, and probably these take place among the males of all birds. But questions of rivalry seem in part to be decided among some of the songsters of the groves by mere musical displays. Caged birds evidently often sing from emulation. It is said that canaries may be taught to sing a complete tune from a musical box, adjusted to play one tune only. A mirror should be placed before the bird and over the box.

The imitative powers so remarkably possessed by the mocking-bird and a few other species, are to some extent possessed by many birds.

SONGHAY, a famous kingdom of Africa, extended both on the e. and w. banks of the river Niger to the s. of the angle which that river makes at Burrum, in lat. 17° 30' north. The reigning king, said to have been the fifteenth of his dynasty, embraced Islam in the beginning of the 11th century. In 1468-69, the ruler of Songhay marched upon Timbuctoo, conquered the town and surrounding state, and added them to his own kingdom. Under Hâj Mohammed A'skia, who came into power at the end of the 15th c., and who was perhaps the greatest sovereign that ever ruled over Negroland, the Songhay empire extended from Hausa almost to the shores of the Atlantic, and from lat. 12° n. to the confines of Morocco. After many years of revolution and civil war, this great empire became a province of Morocco in 1607.

SONNEBERG, a t. in Germany in the duchy of Saxe-Meiningen-Hildburghausen; one of its principal towns; pop. about 4,000. It is 12 m. n.e. of Coburg, and exports woodenwares, musical instruments, and toys. In the vicinity are ledges of slate, which is quarried and made into lead-pencils.

SONNET, a short poetical piece, generally lyrical in its nature, and dealing with one idea of a grave nature, presented under various aspects. It is restricted in length to fourteen lines; the arrangement of the rhymes is peculiar and intricate, and will be best understood by an example—Wordsworth's sonnet on the sonnet—

Nuns fret not at their convent's narrow room;
And hermits are contented with their cells;
And students with their pensive citadels:
Maids at the wheel, the weaver at his loom,
Sit blithe and happy; bees that soar for bloom,
High as the highest peak of Furness Fells,
Will murmur by the hour in foxglove bells:
In truth, the prison, unto which we doom
Ourselves, no prison is: and hence to me,
In sundry moods, 'twas pastime to be bound
Within the sonnet's scanty plot of ground:
Pleased if some souls (for such there needs must be)
Who have felt the weight of too much liberty,
Should find short solace there, as I have found.

SONNINI DE MANONCOURT, CHARLES NICOLAS SIGISBERT, an eminent French traveler and naturalist, born in 1751. Besides a residence for some years at Cayenne, he traveled in Egypt, Greece, the Archipelago, and Asia Minor. He made many valuable researches in natural history, and published several works, the chief being *Voyage dans la Haute et dans la Basse Egypte* (1799), and *Voyage en Grèce et en Turquie* (1801). Sonnini died at Paris in 1812.

SON OF GOD. Considered from the side of dogmatic theology, the phrase Son of God denotes the second person of the Trinity (q. v.). If we examine the use of the name in the Scriptures, we find it to have been applied by Jesus to himself, and given to him by

his disciples, to express the mysterious relationship in which he stood to God. The phrase was one not altogether unknown to the Jews. The plural "sons of God," occurs several times in the Old Testament; in some cases it is applied (tropically) to angels, in others to the children of Israel, and in their collective capacity as the favored nation, they are twice called by God his "son" (Ex. iv. 22, 23; Hosea xi. 1). The use made in the New Testament of the famous passage of the 2d Psalm ("Thou art my Son; this day have I begotten thee") is thought by some to constitute conclusive evidence that the spiritually-minded among the ancient people recognized a "Son of God." It has been argued, however, that if the Hebrews generally, or even their spiritual leaders, had believed the Messiah to be the "Son of God" in any other sense than that he was prophetically filled with the spirit of God, both the idea and the phrase would have played a far more prominent part than they do in the religion and literature of the nation. Nor does it appear that the idea of a "Son of God" (in the divine sense) had rooted itself in the Hebrew mind. Hence we find that the assumption of the title by Jesus provoked the bitterest opposition on the part of the great majority of his countrymen. They did not hate him because he claimed to be the "Messiah," the "Christ;" on the contrary, they were prepared to accept as such any teacher whose words or works might seem to them to justify his pretensions to the dignity; but when Jesus claimed to be the "Son of God," equal and one with the Father, they sought to stone him. It was, in fact, this assertion of his divinity that cost Jesus his life.

SONOMA, a co. in n.w. California, bordered by the Coast range and San Pablo bay on the e., and on the w. by the Pacific ocean; crossed by the San Francisco and North Pacific railroads; drained by the Russian river, Petaluma, Santa Rosa, and Sonoma creeks; 1400 sq.m.; pop. '80, 23,926. The northern surface is mountainous, and thickly covered with yellow and sugar pines, and fir and redwood trees. The beautiful valleys of Petaluma, Santa Rosa, and Sonoma are particularly fertile, having fine orchards and vineyards, the latter celebrated for its wine, which is lighter than that produced in other parts of the state, and suitable for champagne. The climate is mild and uniform. The geysers or hot springs are in the n.e. portion of the county. The principal products are lumber, wine, grain, potatoes, wool, hay, butter, and cheese. Cattle, sheep, and swine are raised in great numbers. It contains deposits of cinnabar, copper, limestone, gypsum, sulphur, alum, granite, and coal. It has manufactories of furniture, iron castings, saddlery, harness, carriages, and wagons; tin, copper, wooden, and sheet-iron ware; establishments for tanned and curried leather, breweries, and saw-mills. Co. seat, Santa Rosa.

SONORA, a frontier state in the n.w. of Mexico, bounded on the n. by the U. S. territory of Arizona, and on the w. by Lower California and the gulf of California. Area, 83,404 sq. m.; pop. '73, 109,388. Several fine bays indent the coast; lagoons occur near the shore; and in the western part of the state there are several lakes. The great system of the Andes skirts the eastern frontier, and throws off branches which occupy much of the surface of the state. In the w. the surface is mostly flat, with a fertile soil, and a warm but variable climate. The chief rivers are the Rio Colorado, Sonora, Yaqui, and Mayo. Two abundant crops are gathered every year from the same land; and the principal crops are wheat, maize, peas, and beans; though tobacco, sugar-cane, and cotton are also grown. But the wealth of the state is not in its agricultural capabilities, but in its mineral treasures, which are considered inexhaustible. "Hardly a village or grazing estate," writes a recent traveler, "but can show some vein of gold, silver, lead, or copper;" and he thinks that in all probability "not a fourth of its existing metallic wealth is known, while not a moiety of that has been or is being developed." The inhabitants of Sonora are for the most part degraded, indolent, and uneducated, and among them mining enterprise has now reached its lowest ebb. See *Arizona and Sonora*, by Sylvester Mowry (Lond. 1834).

SONSONATE, a t. of Central America, in San Salvador, and 40 m. w.n.w. of the city of that name. Pop. about 10,000 inhabitants.

SONTAG, HENRIETTA, an eminent German vocalist, was b. in 1806, and educated for the stage. After a brilliant operatic career at Vienna, Berlin, Paris, and London, she married count Rossi in 1829, and left the stage in 1830. Compelled by pecuniary difficulties to reappear in 1849, she met with renewed success both in Europe and America. She died in Mexico in 1854.

SOO-CHOW, or SU-TCHOU, or SOO-CHOW-FOU (*fou* merely signifying *city*), a large city of China, in the province of Kiang-su, 60 m. w.n.w. from Shanghai. It stands near the Grand canal which connects Hang-chow with Nankin and Peking, but its port is Shanghai, with which also it has water-communication. It is about 10 m. in circumference, and is inclosed by fortifications, outside of which are 4 very large suburbs. The country around Soo-chow is level, and remarkable for its fertility, so that the Chinese speak of it as a terrestrial paradise. The city has silk manufactures, printing establishments, and a large trade in books. In 1857 Soo-chow was captured and sacked by the Taepings. In 1863 it was invested by the imperialists, under a British officer, and the rebel chiefs having surrendered, were treacherously beheaded by the governor of the province.

SOODAN, SOUDAN, or SUDAN, a vast tract of central Africa, bounded on the n. by the Sahara; on the w. by Senegambia; on the s. by Upper Guinea, from which it is separated by the Kong mountains; and on the e. by the Nile provinces of Egypt. The Kóng mountains rise to the height of 3,000 ft.; while mount Atlantika, near the sources of the Chadda, is 10,000 ft. in height. The Niger (q. v.) waters the western regions, and in the e. are lakes Tchad and Fitri. The climate of the w. and middle districts resembles that of Senegambia and Guinea; that of eastern Soodan is still imperfectly known. Agriculture is pursued with considerable skill; cotton, tobacco, and indigo are abundantly grown; and wheat, rice, maize, Guinea-corn, and millet are among the ordinary crops. Gold-dust, which abounds in the rivers; iron, made from iron-stone, which prevails in all parts of the country; and ivory and feathers, are the principal exports. Of the numerous states into which the country is divided, the following are the chief: Bambara, Masina, Gando, Sókoto, Bornu, Bagirmi, Waday, and Dar-fur (now annexed to Egypt). Area estimated at 2,250,000 sq. m.; pop. 10 to 50 millions. Soodan is the peculiar home of the negro race.—Soodan is also the name of a province of Egypt, which is a continuation eastward of the preceding. It includes Kordofan, Nubia proper, Sennaar, etc., with a pop. of about 10,000,000.

SOOLOO' ISLANDS. SEE SULU ISLANDS.

SOONGARIA. See DZUNGARIA.

SOO'SOO, *Platanista Gangeticus* or *Soosoo Gangeticus*, a cetacean of the dolphin family, inhabiting the Ganges, and most abundant in the sluggish waters of its delta, but found also as far up the river as it is navigable. It is supposed to be the *platanista* of Pliny. It is the only known existing species of its genus, and is interesting as a fresh-water cetacean. It attains the length of about 12 ft., and is not unlike the dolphins in its general form. The habits of the soosoo are sluggish, except that in pursuit of prey it moves with great energy and rapidity. The flesh resembles lean beef, but is never eaten by the Hindus, who, however, set a great value on the fat, which lies between the skin and the flesh, as an external medicinal application. There are several fossil species of this genus.

SOOT is that portion of fuel which escapes combustion, and which is mechanically carried up by the current of hot air, either to be deposited on the sides of the chimney, or to be discharged into the atmosphere. The soot of coal and that of wood in all probability differ materially, the former containing more carbonaceous matter and more ammoniacal salts than the latter. Briconnet published an elaborate analysis of the soot of wood; but good recent analyses of both kinds of soot are still required. Both kinds are used as manure; and wood-soot, under the title *fuligo ligni*, was formerly contained in the British pharmacopœias. According to Neligan, it has been found most efficacious in the latter stages of whooping-cough in children, and in some forms of hysteria; and he gives directions for the preparation of a decoction, an extract, a spirit, and a tincture. See Neligan's *Medicines*, etc. (6th ed. p. 53). Contact with soot often gives rise to a peculiar form of cancer, which is consequently known as *chimney-sweepers' cancer*.

SOPHIA, a t. of Bulgaria, 170 m. n.w. of Adrianople, in a beautiful plain on the river Isker. Besides about 30 mosques, it contains several Christian churches, is the see of a Greek and a Roman Catholic archbishop, and carries on manufactures of cloth, leather, silk goods, and tobacco. Its hot springs and baths are highly esteemed. Pop, 24,000. Sophia occupies the site of the ancient Sardica.

SOPHIA DOROTHEA, 1666–1726; b. Germany; called princess of Ahlden; daughter of George William, duke of Celle, and a French lady. She was celebrated for her beauty; and in 1682 she married George Lewis (eldest son of her cousin, the elector Ernest Augustus of Hanover), who became George I. of England. She was divorced in 1694 on account of her intimacy with Königsmark, a Swedish colonel whom she had known in her youth; the intrigue resulting in the assassination of the adventurer and her banishment for life to the castle of Ahlden near Celle. Her son who became George II. took the side of his mother; her daughter became the queen of Frederick William I. of Prussia.

SOPHISTS. The Sophists were the leading public teachers in ancient Greece during the 5th and 4th centuries B.C., and their character has been a subject of much dispute. Most of the historians of philosophy—influenced seemingly by the lampoons of Aristophanes, the comic poet, and by the disparaging remarks of Socrates, Plato, and Aristotle, who stood in a quite different position from the teachers by profession—represent the Sophists as “ostentatious impostors, flattering and duping the rich youth for their own personal gain, undermining the morality of Athens, public and private, and encouraging their pupils to unscrupulous ambition and cupidity.” Mr. Grote, in his *History of Greece*, chap. lxvii., has combated these positions, and given a much more favorable view of the Sophists.

A Sophist, in the original sense of the word (derived from *sophos*, wise or learned), was a wise man, a clever man, one who stood prominently before the public for intellect or talent. Solon and Pythagoras are called Sophists; the name was applied even to great poets. Socrates was repeatedly so designated; Plato is alluded to by the same title. By the general public, any man of intellectual eminence would be spoken of as a Sophist. With the feeling of admiration toward the intellectual class, there was

mixed up a certain invidious sentiment, from whatever cause arising; and the name Sophist being often used to express the dislike as well as the admiration, came ultimately to have a predominating bad sense. Still, the general public, in the use of the word, comprehended Socrates, Plato, and Aristotle, and their philosophical disciples and followers, equally with the professional teachers.

The great intellectual start made in Greece during the 5th c. B.C., led to an advanced standard of general instruction. There had been an established popular education long before—including music, reading, and recitation—but now there were found among the public teachers men of the highest accomplishments that the age could furnish, who taught whatever was known of astronomy, geography, and physics, as well as the newly started controversial discussions in ethics and in metaphysics. These men shared with the other intellectual celebrities the title of Sophist. But there was one circumstance in their case that greatly deepened the invidious sentiment—they taught for pay. This brought them under the odium of two classes: in the first place, the poor, who could not afford the fees, felt themselves in a new position of inequality with the rich; secondly, the philosophers, properly so called, who had not yet begun to receive money from their disciples, held in contempt those that did. Both Socrates and Plato had a vehement repugnance to the idea of a money-bargain between master and pupil; in their eyes, the relationship was one of pure attachment and devotion; and they considered that all the invidious part of the designation Sophist, and more, was richly deserved by the teachers for hire; and as these public teachers, by the nature of their vocation, would probably be often shallow and superficial, as compared with the great philosophers, we can understand the full definition of Sophist by Aristotle—"an imposturous pretender to knowledge, a man who employs what he knows to be fallacy, for the purpose of deceit and of getting money." With all the great authority of Aristotle, this charge applied indiscriminately to the body of men employed in training youth for active life, will not bear investigation. Enough is known of the lives, characters, and doctrines of the class to refute the accusation. The Sophists were a profession growing out of the circumstances, and supplying a want, of the age. The most valuable ideas and habits of any accomplished Athenian were due to his education under some teacher of the class Rhetor or Sophist. So far from the age of the Sophists being an age of corrupted public morality, Mr. Grote contends that it was the reverse. He adduces a multitude of historical facts to prove that the morality of the Athenian public was greatly improved at the end of the 5th c. B.C., as compared with the beginning of that century.

SOPHOCLES, the great master of Greek tragedy, was b. at Colonus, a village about a mile from Athens. The date of his birth is not exactly known, but is fixed at 495 B.C. Sophillus, his father, a man of good birth and fortune, bestowed much care on his son's education; inasmuch that, aided by his highly prepossessing appearance, Sophocles was selected for his skill in poetry and music to lead with dance and the lyre, after the victory of Salamis, the chorus of youths in a triumphal pæan composed by himself. In his 28th year he is said to have *exhibited* his first play; and three years before, in a contest with rival scenic writers, one of whom was Æschylus, he gained the first prize, by the decision of the judges Cimon and his colleagues. He had, by Nicostrata, two sons, and one by Theoris, a Sicyonian woman. Iophon, one of his two sons by Nicostrata, summoned him in his old age before the Phratores, on the charge of incapacity to manage his private affairs, but he refuted the charge by reciting to the court a beautiful chorus from his *Œdipus in Colonus*. He died at the age of 90, full of years and honors. His private character was easy and contented, but not, as has been hastily assumed, profligate. His turn of mind was devout, as is evident throughout his plays; and he evinced no taste for political or active life, although he is said to have accepted command in the Samian war. He was a prolific author. He was the reputed composer of as many as 130 plays, of which, however, 17 have been deemed spurious. He gained, according to his biographer, the first tragic prize 20 times, bearing the palm on several occasions from Æschylus and Euripides, not to mention less well-known competitors. He wrote also pæans, elegies, and epigrams, of which we have but few remains. He lived on terms of intimacy not only with his great rivals, but with Aristophanes and Herodotus. We have no knowledge of the order in which his plays, that have survived, were written. The most plausible arrangement is perhaps that of Müller, who graduates them as follows: *Antigone*, *Electra*, *Trachinie*, *Œdipus Rex*, *Ajax*, *Philoctetes*, *Œdipus Coloneus*. Sophocles is justly accounted the most perfect of the Attic tragedians. In his hands tragedy becomes the true and faithful reflex of human feelings, passions, impulses. His ideas are ethical, with a constant reference to a divine disposer of events. "There has hardly," says Müller, "been any poet whose works can be compared with those of Sophocles for the universality and durability of their moral significance. Of all the poets of antiquity, he has penetrated most deeply into the human heart." His versification is remarkable for its softness and fluency. The best editions are those of Wunder (Gotha and Erfurt, 1831-46) and Schneidewin. The chief translations of Sophocles into English are those of Potter (Lond, 1788), Dale (Lond, 1824), and Plumptre (1865). We may also mention special translations by prof. Thompson of the *Ajax*, by Dr. Donaldson of the *Antigone*, and by prof. Campbell of the *Antigone*, *Electra*, and *Dejanira*.

SOPHOCLES, EVANGELINUS APOSTOLIDES, LL.D., b. Greece, 1807; educated at Mt. Sinai convent and at Amherst college in the United States, whither he emigrated. He was tutor in Greek, for most of the time between 1842 and 1859 at Harvard college, where since 1860 he has been professor of ancient, modern, and Byzantine Greek. Among his publications are a *Greek Grammar* (1838); *Romæ Grammar* (1842); *Catalogue of Greek Verbs* (1844); *History of the Greek Alphabet* (1848); *Glossary of Later and Byzantine Greek* (1860), of which a revised edition appeared in 1870 as *Greek Lexicon of the Roman and Byzantine Periods*.

SOPRANO (Ital.), the highest species of female voice, whose range extends from

to

, or in some cases higher. The highest notes generally belong to the

falsetto register. Sweetness and mellowness are the characteristic qualities of a soprano voice, which is for the most part less full than an alto, but lighter, fresher, and more expressive of joyful, lively, and highly impassioned feelings. Music for soprano voices is usually written in the treble clef, but sometimes in the soprano clef with C on the first

line . A voice sometimes distinguished as intermediate between alto and

soprano, is the *mezzo-soprano*, whose usual compass is from  to .

SORA, a city of southern Italy, in the province of Caserta, with 71,510 inhabitants. It stands in a fertile plain, watered on one side by the Liris or Garigliano, which is spanned by two bridges at the town. The population is industrious and wealthy. There are manufactories of woolen cloth and of paper. Sora was originally a Volscian town, passed into the possession of the Samnites, and then into that of the Romans. Remains of the cyclopean walls of the ancient citadel are still visible.

SORACTE, a mountain in ancient Etruria, in the territory of Falisci, called Monte di San Silvestro, and at present Monte di Sant' Oreste, from a village situated on its side, noted for its sour wine. It is 25 m. n. of Rome, separated from the Apennines by the valley of the Tiber, and rises abruptly 2,420 ft. above the adjacent plain. It had formerly on its summit a temple dedicated to Apollo, to which companies of worshippers proceeded from Rome, with great solemnity. The monastery of San Silvestro which now occupies the site of the temple was founded by Carloman in 746.

SORAU, a t. of Prussia, in the province of Brandenburg, 60 m. s.s.e. of Frankfort-on-the-Oder. It has important bleach-fields, print-works, and color-works. Pop. '75, 13,191. Sorau is one of the oldest towns in Prussia.

SORB. See **SERVICE**.

SORBONNE, a celebrated academic body at Paris, which dates from the middle of the 13th c., and which, down to the French revolution, held a prominent place in all church controversies. It derives its name from its founder, Robert de Sorbon, a canon of Cambrai, born at Sorbon, in the Ardennes, in 1201. He was selected by Louis IX. as his chaplain and confessor. At this time the university of Paris was at the very height of its celebrity, and Robert de Sorbon resolved on opening in it an institution in which a society of secular priests, being provided with all the necessaries for their own maintenance, should devote themselves gratuitously to the teaching of theology. It was established with the sanction of king (afterward St.) Louis in 1252, originally for the reception of 16 scholars, four respectively from the Gaulish, Norman, Picard, and English nations, to which the German was subsequently added. Robert was himself the first head; and in 1270 drew up its constitution, which remained in force without any substantial alteration till the French revolution. It was not confined to the original poor scholars, but extended to the bachelors and doctors aggregated to the body of the Sorbonne. All these were of necessity graduates of the faculty of theology of the university of Paris, but they were only admitted to membership of the Sorbonne by the votes of that body, which formed one of the four constituent parts of the theological faculty, and after a public disputation, technically called the "Sorbonica," or "Robertina," in which the disputant was required to sustain against all antagonists, from the hour of five in the morning to that of seven in the afternoon, theses or propositions selected from the whole range of theological science. The first disputant was a Franciscan friar named Mayron, a scholar of John Duns Scotus; but he was followed by many of the greatest names in mediæval and post reformation history. These "Sorbonne acts" form in some respects one of the most characteristic chapters in mediæval literary history. The disputants in some cases exceeded 60 in number. The foundation of Robert de Sorbon was approved in 1268 by Clement IV.; but the name of Sorbonne does not appear to have been appropriated to it till the 14th century. Robert de Sorbon also established another preparatory college for the study of the humanities and philosophy, which was called the

college of Calvi, or the little Sorbonne. In the 15th c. the Sorbonne, as being in great measure identified with the theological faculty of the Paris university, holds an important place in the history of theological controversy, and in all the contests which followed the reformation in France; there being few of the great names of the Gallican church which are not included in its academic roll. Among the munificent works of the great cardinal Richelieu, who was a pupil of the Sorbonne, was what may be described as a complete reconstruction of the buildings. The new Sorbonne comprised, in addition to the public academical hall, lodgings for the 36 doctors, which were assigned to the doctors successively in the order of seniority. The head of the Sorbonne institute was called provisor, and was elected by the members together with the archdeacon of Paris, the four deans of faculty, and some other dignitaries of the university. Besides the resident members of the Sorbonne, there were also external associates, called "Soci-Hospitalitatis," who had no share in the governmental acts of the institution. The Sorbonne continued in the enjoyment of its privileges and its revenues down to the revolution, when it shared in the common ruin of all the ecclesiastical establishments of France. At the re-organization of the university by Napoleon in 1808, the Sorbonne was re-established as the theological faculty of that body; but it failed to recover its old prestige even with the clerical body. One of the conditions of membership was an oath to maintain the celebrated four "Gallican propositions." See GALICAN CHURCH. This condition deterred many; and although it was revoked by the proposed concordat of 1817, yet on the failure of this concordat, it still continued in force down to the revolution of 1830. In the more recent organization of the university of France, the Sorbonne has resumed its place as the representative of the faculty of theology, with seven professors and a dean of faculty. The professorships are of dogmatic theology, moral theology, sacred scriptures, canon laws, church history, Hebrew, and sacred eloquence. These professors, however, are named by the minister of public instruction; and the absence of control on the part of the bishops over their appointment and their teaching has led to the general withdrawal of clerical students from the schools. Nevertheless, the Sorbonne still possesses at least the permissive sanction of the church, and the authorization of the archbishop of Paris may be seen attached to the printed programme of its courses. Distinguished churchmen like the late bishop of Orleans have been of the number of its professors.

SORE CIDÆ, a family of mammalia, of the order *carnaria*, and section *insectivora* of Cuvier. They are generally small animals, covered with soft hair; under which, on each flank, is a band of stiff closely-set bristles, and among them glands which exude a peculiar odorous fluid. The legs are short, and the feet are five-toed, and generally formed for burrowing. Some species are aquatic, and their feet webbed. The sorecidæ are all plantigrade. Most of them are nocturnal animals. They generally feed on insects and worms. A remarkable characteristic of the family is the elongated muzzle. They have long incisors, and their molar teeth are generally furnished with conical points. The tail is generally scaly. To this family belong shrews, shrew-mice, musk rats or desmans, etc. They are found both in warm and cold climates. Those which inhabit cold climates generally pass the winter in a lethargic or dormant state.

SOREL, a t. in Richelieu co., Quebec, Canada, on the St. Lawrence, near the mouth of Sorel or Richelieu river, 45 m. below Montreal; on the South-eastern railroad; pop. '80, 7,500. It was the summer resort for Canadian governors for many years, and vessels plying between Montreal and Quebec make it their winter-quarters. Dealing in lumber and ship-building are the most important interests. It contains manufactories of engines, stoves, plows, leather, mill machinery, and bricks, also saw and flour mills. It has a Roman Catholic college, academy, and hospital, weekly papers, and a periodical printed in French.

SORESINA, a mercantile t. of northern Italy, province of Cremona, with (1871) 8,553 inhabitants. A great trade is carried on in a kind of condiment called *Mostarda*, which is prepared there; consisting of fruits, etc., preserved in vinegar and sugar, and also in a kind of liqueur called *Mistrà*, held in great repute in Italy as a carminative.

SORGHO GRASS AND SORGHUM. See DURRA.

SO RIA. See NUMANTIA.

SOROCA'BA, a t. of Brazil, in the province of São Paulo, stands on a river of the same name, 70 m. w. of the city of São Paulo. Pop. 12,000.

SORO'SIS, a women's club in New York; organized March, 1868, occasioned by the refusal to women of equal privileges with men at the Dickens dinner—Mrs. Jennie C. Croly leading in the movement. It is divided into ten working committees: art, science, music, literature, education, philanthropy, drama, journalism, house and home, and working women. Its meetings are held at Delmonico's on the first and third Mondays in each month; at the first, friends of members are entertained by social exercises, in charge of two of the committees; at the second, for members only, facts relating to the advancement of women and other topics are discussed, interspersed by musical exercises. The presidents have been Miss Alice Cary, Mrs. Croly, Mrs. Wilbour, and the treasurer Mrs. Ruth O. Delemater.

SORREL, *Rumex*, a genus of plants of the natural order *polygonææ*, very closely allied to *polygonum* (q.v.) and *fagopyrum* (see BUCKWHEAT), but having the perianth divided into six segments, the three inner of which enlarge and cover the *achenium*. The genus is very naturally divided into two sections, the first of which is already noticed in the article DOCK. The name sorrel belongs only to the second, characterized by diocious flowers, and acidity of stems and leaves. COMMON SORREL (*R. acetosa*) is a perennial found in meadows and pastures throughout the whole of Europe, and is very plentiful in Britain. Its stem is from a foot to two feet high; its leaves arrow-shaped. It is an agreeable salad, and is used in soups and sauces, and as an addition to dishes of greens. It is therefore sometimes cultivated in gardens.—FRENCH SORREL, or ROMAN SORREL (*R. scutatus*), a native of France and Italy, has broader and blunter leaves, and is more frequently cultivated than common sorrel, being considered of finer flavor. SHEEP'S SORREL (*R. acetosella*) is a very similar plant, but of much smaller size, and its roots run very much under-ground, so that it is a very troublesome weed in gardens and fields of poor dry soil, in which it is very common in all parts of Britain.—FOR WOOD SORREL, see OXALIDÆÆ. For the RED SORREL of the West Indies, see HIBISCUS.

SORREL TREE, *Lyonia arborea*, formerly *Andromeda arborea*, a tree of the natural order *Ericææ*, remarkable in that portion of the order to which it belongs for its magnitude, its near allies being generally small shrubs. It grows chiefly on the Alleghany mountains, from Virginia to Georgia, and attains a height of 50 ft., with a trunk 12 to 15 in. in diameter. The wood is of little or no use. The leaves are acid, and are sometimes used for dyeing wool black.

SORRENTO (Lat. *Surrentum*, Gr. *Syrentum*), a maritime t. in the s. of Italy, province of Naples, is situated on the s.e. side of the beautiful bay of Naples, on the promontory which separates the latter from the gulf of Salerno, about 7 m. s.w. of Castellamare. Pop. '71, 5,502. It is an archiepiscopal see, and possesses a cathedral. The manufacture of silk is extensively carried on. There are still considerable remains of the walls which were erected in the middle ages, and on the landward side it is surrounded by a broad and deep ravine, the side toward the sea being protected by precipitous rocks. On the n.w. of the town is a considerable plain or table-land, called *Piano di Sorrento*, about 1000 ft. above the sea level, surrounded and protected from the cold e. winds by a range of hills; it is intersected by numerous gorges and ravines, studded with villas and farm-houses, and covered with orange groves and vineyards; all which combined render the vicinity of the city in a high degree picturesque. It is celebrated for the mildness, dryness, and general salubrity of its climate, on which account it has been much resorted to both in ancient and modern times by invalids and convalescents. Among the Romans the wine of Sorrento was held in high reputation; it had to be kept about 25 years before it arrived at maturity. Nothing certain is known of the origin of Sorrento, but it is believed to be very ancient, and many ruins are pointed out by the *ciceroni* as being remains of Roman temples, etc. Tasso was a native of Sorrento.

SORTES BIBLIÆ, SORTES VIRGILIANÆ, etc.—Among the ancients, a favorite kind of divination was that known as *stichomancy*, or divination by lines of poetry. The method pursued was to select a number of verses from a poet, mix them together in an urn, draw one out at random, and from its contents to infer good or evil. As Virgil was the most popular and admired of all the Latin poet, his writings, and especially the *Æneid*, became the favorite book for this purpose, and it was undoubtedly this practice that laid the basis of the great reputation as a magician Virgil enjoyed during the middle ages. The Sibylline oracles were also much used for the same purpose. The practice did not cease with the introduction of Christianity; but instead of Virgil, or, to speak more correctly, alongside of Virgil, the Bible was employed to ascertain the future. In place, however, of throwing lines into a "heathen" urn, it was customary to open the book, as it were accidentally, or to stick a pin between the leaves at hazard, and then open the book—the passage first catching the eye being regarded as pregnant with prophecy as to your future welfare. Such lots drawn from Scripture were called, in the middle ages, *Sortes Biblicæ*, just as those drawn from Virgil were called *Sortes Virgilianæ*. The custom of using (or abusing) the Bible in this grossly superstitious way still lingers in England, Scotland, and other countries, but it is now more a frolic of children than aught else. The poet Hafiz is still so used in Persia.

SORTIE, an outrush of a beleaguered garrison, equivalent to SALLY (see SALLY PORT).

SORUS. See FERNS.

SOSTENU TO (Ital.), a term used in musical notation, to indicate a sustained mode of execution, continuous in respect of tone.

SOTERIOLOGY. See ATONEMENT, *ante*.

SOTHERN, EDWARD ASKEW, 1830-81; b. Liverpool. He was educated for the church, but the stage was more congenial to his tastes. In 1851 he came to the United States, and appeared at the National theater of Boston in the character of "Dr. Pangloss." He was a stock actor in Barnum's museum, New York, till 1854, when he joined Wallack's

company. In 1858 the character of "Lord Dundreary" in Tom Taylor's comedy *Our American Cousin* was assigned to him. He accepted the part with great reluctance, but his drawl, lisp, and peculiar skip made the play a great success, and it ran for 140 consecutive nights. In 1861 he appeared as "Lord Dundreary" in London, and the play was performed 496 nights. In 1864 he appeared as "David Garrick"; in 1874 in the part of "Brother Sam," written for him by John Oxenford. He returned to New York in 1874, played "Dundreary" and "Garrick" at Wallack's theater, and appeared later in the same parts in all the large cities. In 1878 he was again very popular in the character of "The Crushed Tragedian."

SOTTEVILLE-LÈS-ROUEN, a small t. of France, in the dep. of Seine-Inférieure, 4 m. s. of Rouen by railway. Pop. '76, 11,278.

SOU, or **SOL**. See **SOLIDUS**.

SOUARI NUT. See **CARYOCAR**.

SOUBISE, BENJAMIN DE ROHAN, Seigneur de, 1589-1641; the brother of the duc de Rohan; served when young with Maurice of Nassau in Holland. In 1621 he took command of the Protestant forces in Brittany, Anjou, and Poitou. After the capture of St. Jean d'Angely he received the pardon of Louis XIII., but in 1622 was again in the field for the cause of the reformation. Again defeated, he fled to Germany and England; was again pardoned, but, after three years of inaction, seized the isle of Rhé, and after a sea fight fled a second time to England. He sailed with Buckingham and Denbigh to Rochelle, both expeditions proving failures. A third attempt was prevented by the murder of the duke of Buckingham by Felton. The rest of Soubise's life was spent in England in intrigue against the French monarchy.

SOUBISE, CHARLES DE ROHAN, Prince de, 1715-88: b. France. He served Louis XV as *aide-de-camp* during all the campaigns from 1744 to 1748, and in the last year was made field marshal. In 1751 he was placed at the head of the Flanders and Hainault government, but was disgracefully defeated by the Prussians at Rosbach. But he was the favorite of Mme. Pompadour, and was made state minister by Louis. In 1758 he was again placed at the head of the army and defeated the Hessians, Hanoverians, and English at Sondershausen and Sutzenberg. Soubise paid court to Dubarry, the king's new favorite, and even allowed his cousin to marry her nephew. Of all the courtiers, he alone followed the body of Louis XV. to its grave. Under Louis XVI. he retained his position as minister.

SOUDAN. See **SOODAN**.

SOUFFLÉ, a light and agreeable dish, consisting chiefly of the whites of eggs, to which other ingredients (chocolate, cheese, vanilla, orange-flower water, rose-water, various essences, etc.) are added, to give consistency, flavor, and variety. The materials have to be agitated with a whisk until the whole is in a creamy froth; which is then baked in a soufflé-pan, made of such a form as to fit into a dish or proper holder, that can be sent to table, and quickly handed round.

SOUKCHOUM KALE', a sea-port town of Asiatic Russia, in the government of Transcaucasia, on the e. coast of the Black sea. In 1831 a commercial port was established here, which, however, has surrendered its pre-eminence to Poti, a town about 70 m. to the s.e. Soukchoum Kale was captured by the Turks at the beginning of the Russian war of 1877. Pop. '67, 1612.

SOUL, in the language of spiritualistic philosophers, covers the whole region of mind, and is generally conceived of as a naturally imperishable entity, in relation with the body, but definable, for the most part, only in terms of the complete negation of material attributes. With this the popular conception in the main coincides, though it is less labored and considerably less negative. In its original signification the word appears to have stood for the principle of life both in men and in animals. The modes of conceiving it were various: it was sometimes regarded as the mere harmony of the bodily functions, and sometimes as a distinct entity of highly ethereal nature, and generally supposed to be seated in, or connected with, the blood; but no essential distinction was made between the soul of man and the soul of brutes. Very soon, however, the manifest superiority of man to the lower creation suggested difficulties, which were increased as the thought of an after-life, in a different sense from transmigration, was gradually developed. And in man, the constant war among his members, the opposition of passion and reason, as it began to be observed with the growing habit of introspection, called for some explanation which should apply to humanity only. To meet all such difficulties, a "trichotomy," or three-fold division of the human constitution was assumed, according to which a naturally immortal and rational element was supposed to make part of man, besides the animal soul (always variously conceived) which he shared with the brutes. Between the two distinct elements—the animal and the rational soul—the various mental energies were differently apportioned by different thinkers, according as those energies were thought more or less noble and divine. Without going back upon obscure traditions regarding the beliefs of the early peoples, Plato's views may be cited as amounting to a trichotomy, and in Aristotle there is the

distinct mention of a noetic principle in man by the side of the animal soul. Later Greek schools put forward a similar view; and Philo, the forerunner of the Neoplatonists, even spoke of *the soul of the soul*. Lucretius has the same curious expression, to which corresponds the distinction of Roman writers in general between *animus* and the animal soul, *anima*. The earliest Christian writings occasionally distinguish body, soul, and spirit (*pneuma*). Such a threefold division was unfamiliar to the Jewish mind, which appears to have rested in a kind of dualism, and was removed even from the common Greek philosophical expression, *pneuma* being the word employed by Stoic dualists to describe the fine ethereal nature of the material soul. It is hard to say whether a thoroughgoing trichotomy was meant by the Christian writers, or whether the soul was not merged in either of the extreme elements—the coarse material body, or (as commonly conceived) the finely attenuated but still material spirit. Till about the 4th c., the language of trichotomy prevailed in the Christian writings, but thenceforth the doctrine became suspect, having been specially appropriated by certain heretical sects, and soul and spirit came to be identified in substance, and distinguished only in function. Aquinas, and, later, Calvin, pronounced in favor of the dualistic rendering, after which modern popular expression has been molded, chiefly through the predominant influence of spiritualism since the time of Descartes. This gives prominence to the word soul over spirit, except in religious and purely metaphysical aspects. The successors of Descartes have followed him in calling the single soul at once both rational and sensitive; but in rejecting, almost without exception, his description of the lower animals as mere mechanical automata, they have ignored, without an attempt to explain, the real difficulty that he sought to get rid of, and that the trichotomy sought to meet. The ancient doctrine has been revived in various shapes by Paracelsus, Van Helmont, the anatomist Willis, De Maistre, and others.

The Egyptian doctrine of the soul is one of the most important, as it is the most ancient, for this nation appears to have been the first to declare that the soul was immortal. The genesis of the soul itself, however, is not defined by the monuments, although the existence of a cosmic soul, from which the others proceeded, is mentioned by ancient authors. The following may be gathered from a comparison of the papyri and monuments with the traditions handed down by the classical writers:—The soul itself, once separated from the cosmic or mundane soul, was supposed to undergo numerous transmigrations, passing from one animated body to another till its cycle of existence was fulfilled. The soul was considered to be essentially distinct from the body, and only connected with it through the link of life. It was represented in the hieroglyphs by several signs, as a basket of fire, a heron, a hawk with a human face, and a ram. Its nature was divine, but after death it passed to the great judgment in the hall of the two truths, where it was tried before Osiris and the forty-two assessors or demons of the dead, whose verdict determined its future destiny. This depended upon the sins it had perpetrated during life, and which more or less interfered with its transmigration through the necessary cycle of existence till its ultimate union with the deity, and reception into the Egyptian heaven. In the judgment it was accused by the enemy or accuser; and after the judgment it was either devoured or annihilated, passed to the region of the Egyptian hell, or to the place of the metempsychosis, from which it entered some body of man or animal on the point of entering into existence. The great desire of the dying, indeed was, that his soul should pass off the earth, its detention here preventing its ascent to the moon or heaven. The souls of the wicked passed into the Egyptian hades, which the sun was supposed to traverse during the hours of the night. There they were subjected to punishments of a corporeal rather than spiritual nature—burned in brasiers, plunged into streams, kept in utter darkness, and deprived of the presence of the sun-god, uttering fearful howls and wails in the prisons within which they were confined. After the passing of the great judgment the soul underwent a series of transformations and adventures in the future state. It was justified, as Osiris had been, against the accusations laid to its charge by evil spirits. It assumed the form of a hawk, heron, swallow, and of a snake with a human head—that of the cosmic soul. In the fields of the Aah-en-ru, or Ahlu, the Egyptian Elysium, it sowed and reaped the harvest of gigantic grain which grew in that happy plain. It ascended the *makhen*, or mystical bark, and rowed through the winding of the celestial Nile, passed the fiery caldron of the hades, revisited the body, entered the boat of the sun, and passed through different regions of the Egyptian hell, in which the damned were detained, arriving at last at the manifestation to light. To preserve the body, in order that the soul might revisit and probably reanimate it at a future period, not only was it embalmed with the greatest care, but amulets were attached to it which were supposed to have the power of retaining the vital warmth, and of protecting it from destruction or decay. The period after which the soul was supposed to enter again into a human body was 3,000 years, during which it transmigrated through other orders of animated nature. The principal dogmas, indeed, of the soul among these people were its creation or emanation from the cosmic soul, its transmigrations, and its final reception into heaven, where it lived in the boat of the sun, and traversed the liquid ether in company with that luminary. The Pythagorean and Platonic schools seem to have drawn extensively from Egyptian sources in regard to the nature and des-

tiny of the soul. The Brahmanical and Buddhistic notions of the soul have also much in common with the Egyptian. See BUDDHISM, TRANSMIGRATION.—Herodot. ii. 23; Plutarch, *De Isid.* c. 29; Hermes, *Clavis*; Prichard, *Egypt. Mythol.*; Rheinisch, *Denkm. in Miramar* (Wien, 1865); Tylor's *Primitive Culture* (1871).

SOULANGES, a co. in w. Quebec, Canada; adjoining Glengarry co., Ottawa, on the w. and bounded s. by the St. Lawrence river; 138 sq.m.; pop. '71, 10,808. The surface is undulating and fairly fertile; wheat, oats, rye, potatoes, and dairy products are the staples. Co. seat, Coteau Landing.

SOULE, GIDEON L., 1796-1879, b. Maine, educated at Bowdoin college. He was connected with Phillips Exeter academy for more than 50 years; was for 17 years the associate at that institution of Dr. Benjamin Abbot, its first principal, and was himself principal, 1838-73. The school under his management took a high rank among American fitting schools.

SOULE, JOSHUA, D.D., 1781-1867; b. Maine; licensed to preach in 1798; joined the Methodist conference in 1799; ordained elder in 1802; appointed presiding elder of the Maine district in 1804; chosen book agent and editor of the *Methodist Magazine* in 1816; elected bishop in 1820, but declined; stationed at New York in 1821 and at Baltimore in 1822-23; re-elected and consecrated bishop in 1824; was delegate from the general conference to the British Wesleyan conference in 1842, and afterward traveled in the British islands and France. On the division of the church he adhered to the south, resided in Nashville, Tenn., and made an episcopal tour in California, 1853-54. He is the senior bishop of the Methodist Episcopal church.

SOULÉ, PIERRE, 1801-70; b. Spain; educated at Bordeaux and Toulouse. He took part in a conspiracy against the Bourbons; edited a radical paper; was sentenced to imprisonment for articles reflecting on the ministry; escaped and settled in New Orleans in 1825. There he was admitted to the bar, and soon acquired a large practice. In 1847 he was elected to the U. S. senate to fill a vacancy; re-elected in 1849. He represented extreme southern views, and was prominent in the debates on the compromise measures of 1850. He was appointed minister to Spain in 1853. He wounded Turgot, the French ambassador, in a duel; favored the insurrection in Madrid in 1854; took part in the Ostend conference in the same year, and returned to the United States in 1855. He opposed the secession of Louisiana, was arrested in 1862 for disloyalty and imprisoned. He was released on condition of leaving the country, to which he returned shortly before his death.

SOULIÉ, MELCHIOR FRÉDÉRIC, 1800-47; b. France. He was expelled from the law school in Paris on account of his radicalism. In 1824 he published a volume of poems, *Amours Français*, and in 1828 his drama *Roméo et Juliette* was produced at the Odéon. In 1832 his play *Clotilde* was performed, and in 1836 he wrote a novel, *Diane et Louise*, which proved very successful. Among many other novels, he published *Le Maître d'École*; *Si Jeunesse Savait, si Vieillesse Pourrait*; and *Mémoires du Diable*.

SOULOUQUE. See FAUSTINUS I.

SOULS, CURE OF (Lat. *cura animarum*, care of souls), the technical phrase by which the canon law describes the charge which is given to a pastor, no matter of what degree of dignity, over the spiritual concerns of a flock; and the words especially imply the right of administering the sacraments. In this sense the phrase is used to mark an important distinction between two classes of benefices or church livings—"benefices with," and "benefices without" the cure of souls. Of the latter class are canonries, prebends, and the whole class known in the canon law as "simple benefices." Of the former are parochial cures, vicarial cures, and still more the higher charges of archbishop, bishop, etc.

SOULT, NICOLAS-JEAN DE DIEU, Duke of Dalmatia and Marshal of France, the son of a notary, was b. at Saint-Amiens-la-Bastide, in the dep. of Tarn, March 29, 1769. In 1785 he enrolled himself as a private in the royal infantry regiment, and so distinguished himself by his steady obedience to discipline, indomitable *sang-froid*, and general intelligence that, in 1792, he became adjutant-major. His behavior at Fleurus gained for him (Oct. 11, 1794) the brevet of general of brigade. From 1794 to 1799 he was employed on the eastern frontier, and in the retreat after the defeat of Stockach (March 25, 1799), his able handling of the rear-guard alone prevented the annihilation of the French army. Appointed general of division (April 21, 1799), and put under Massena, whom he ably seconded in Switzerland and Italy, he was afterward, on the warm recommendation of Massena, appointed by Napoleon to one of the four colonels of the consular guards, and now became an ardent Napoleonist. This devotion, doubtless, was a great means of his obtaining the bâton of marshal of France; but he most certainly justified his appointment by his brilliant achievements in the subsequent campaign against the Austrians, closed by the battle of Austerlitz, which he decided by piercing the Russian center. He also did good service in the Prussian campaign, and took an important, though not a prominent, part in the Russian campaign of 1806-7,

after which he was appointed governor of Berlin and created duke of Dalmatia. Soult was next placed at the head of the second corps in Spain, pursued the retreating British, attacked them at Coruña, and though repulsed, forced them to leave all their matériel behind. He then conquered Portugal and exercised vice-regal authority over it, but the sudden arrival of Wellesley at Coimbra, and of Beresford at Chaves, made him retreat rapidly to Galicia. In Sept., 1809, he became commander-in-chief in Spain, gained a brilliant victory at Ocana (Nov. 18); and at the commencement of the following year overran and subdued Andalusia, continuing to command in person the southern army. In attempting to succor Badajoz, which he had captured and garrisoned (March 11), he was defeated by Beresford at Albuera (May 16, 1811). After the battle of Salamanca and the advance of the British on Madrid, Soult became thoroughly disgusted at the rejection of his admirable plans for transferring the theater of war to Andalusia, and demanded and obtained his recall; but on the news of Vitoria (q.v.) reaching Napoleon, Soult, whom alone he considered capable of turning the tide of ill-fortune, was, in all haste, restored to the command-in-chief of the army of Spain. Now, however, it was not in Spain, but in France, that the contest had to be waged, and the advantage of numbers, discipline, and prestige were all on the enemy's side; nevertheless, by a system of military tactics which has been universally admired, he completely neutralized the consummate strategy of Wellington, and reduced the campaign, during the seven months it lasted, to a mere trial of strength, the defeats which he sustained at Orthez and Toulouse being due to the superiority of the British soldiers, not of their general. With his usual suppleness of character he became an ardent royalist after the abdication of Napoleon; but on the return of the latter from Elba, he abandoned Louis XVIII. and became maj.gen. of the imperial army. After Waterloo he rallied the army at Laon; and on July 3, at the council of war, coincided with Carnot as to the uselessness of further resistance. To avoid the punishment due to his treachery he published a memoir traducing Napoleon in the basest manner, and lauding the "lawful princes" (i.e., the Bourbons); but in spite of this he was banished and not recalled till May, 1819; however, in the course of a few years more, he was restored to all his former honors, and took an active part in politics and in the development of French industry. In 1833 he was sent as ambassador to England, and, as the great antagonist of Wellington, was received with the utmost enthusiasm. In 1845 he retired from active duty, was honored with the appointment of "marshal general of France," and retired to his residence of Soultberg, where he died, Nov. 26, 1851. In the following year a statue of him, in white marble, was placed in the galleries of Versailles. See Soult's *Mémoires*; also, Napier's *History of the Peninsular War*; Thiers's *Histoire de la Révolution et de l'Empire*; and Salle's *Vie Politique du Maréchal Soult* (1834).

SOUND (Lat. *sonitus*) is the impression produced on the ear (q.v.) by the vibrations of the elastic medium, such as air or water, in which it is plunged. That this is the case is proved, *first*, by the fact that a bell or tuning fork *in vacuo* gives no sound when struck; *second*, by the fact that mere currents, as such (winds, running water, etc.), do not produce the sensation of sound until they are frittered down into vibratory motions by obstacles.

The most untutored ear distinguishes at once between a mere *noise* and a *musical note*. It of course distinguishes a *loud* sound from a faint one. Moreover, it distinguishes musical notes from one another by their shrillness or gravity, or, as it is technically called, their *pitch*. Again, as in the case of vowel-sounds sung to the *same* musical note, or as in the case of different instruments (flute and violin, for instance) playing the same note, it distinguishes something further—which is called the *quality* of the note. It is on the pitch of notes that the theory of music (q.v.) is based, for the quality is only of importance in giving variety, as in orchestral music—or in giving richness of tone in a solo. The most perfect *music*, so far as theory goes, may be executed on the poorest instrument, but it gives little pleasure from the want of richness or quality. In the same way a singer may possess faultless intonation, yet the performance, though *musically* perfect, may, from the harsh quality of the voice, be unpleasant. We intend in the present article to avoid everything connected with music, and have made these remarks to show that there is something in the theory of sound more profound than is contemplated in the theory of music.

The questions we have now to discuss are:

1. What constitutes the difference between a mere noise and a musical note?
2. On what does the pitch of a note depend?
3. On what does its quality depend?

The answers to these queries are all contained in the following statement:

Every musical note consists in the repetition at equal small intervals of time, of some definite noise; the pitch depends on the rate of repetition; and the quality upon the nature of the fundamental noise.

Rough experimental illustrations of the parts of this statement are easily given, more refined ones will be afterward alluded to. If, for instance, the edge of a card be held to a revolving toothed-wheel, a definite noise is produced as each tooth bends the card and allows it to spring back. While the wheel revolves slowly, we can distinguish these suc-

cessive noises; but when it is revolving so fast that they are no longer separately distinguishable, the character of the sound changes completely. It now becomes continuous, and, so far as the ear can detect, uniform, and thus becomes a musical note (with such an apparatus, not a pleasing one). As the wheel is made to revolve faster and faster, the pitch of the note rises till it becomes a sort of shriek, and finally becomes inaudible. The *sirène* (q.v.) gives another excellent illustration. In this case the fundamental noise is produced by a puff of air escaping from an orifice; and we observe, just as before, that the greater the number of such puffs per second, after they have become so frequent as to be separately undistinguishable, the higher is the pitch of the musical note produced.

Now, if by machinery we arrange matters so that the *sirène* and the toothed-wheel give the number of puffs and the number of impacts on the card the same per second, the musical note produced by each has the same pitch. But the notes differ greatly in quality, the one being exceedingly soft and pleasant, the other harsh and grating. The pitch, therefore, depends on the number of noises per second, and the quality upon the nature of the fundamental noise. We shall find a complete theoretical proof of this later.

The general nature of the mechanical process by which sound is propagated in the air will be illustrated, and compared with other cases of wave-motion, in our article on WAVES. Meanwhile, it is only necessary for us to observe that, as the velocity of sound is ten times greater than that of wind in the most violent hurricane, it is not *air* itself which is transferred from place to place, but a *state of disturbance* (condensation or rarefaction) of the air. Each successive layer of air in the path of the sound suffers this disturbance in turn, and by virtue of its elasticity (q.v.) passes it on to the next.

Newton was the first who attempted to deduce from mechanical principles the velocity of sound, but only for the particular case in which each particle of air in the path of the sound is supposed to move backward and forward according to the same law as the bob of a pendulum (q.v.). He showed that this species of motion is consistent with the elastic properties of air, as given by Boyle's or Mariotte's law (q.v.), viz., that the pressure of air is proportional to its density. The velocity of sound in this case is of course to be found from the time which elapses between the commencement of the motion of any one particle of air, and that of another at a given distance from it, in the direction in which the sound is moving. The numerical result deduced by Newton with the then received experimental data for the compressibility of air, was 979 ft. per second. This investigation was very defective, applying, in fact, solely to the special case of a pure musical note, continually propagated without lateral divergence; yet the solution obtained by Lagrange from a complete analysis of the question, gave precisely the same mathematical result.

But, by direct measurements, carefully made, by observing at night the interval which elapses between the flash and the report of a cannon at a known distance, the velocity of sound has been found to be considerably greater—in fact, about 1090 ft. per second, at the temperature of freezing water.

Newton seeks for the cause of the discrepancy between theory and observation in the idea that the size of the particles of air is finite compared with their mutual distance; and that sound is instantaneously propagated through the particles themselves. Thus, supposing the particles to have a diameter $\frac{1}{3}$ of the distance between them, we must add $\frac{1}{3}$ to the space traveled by sound in a second, i.e., to the velocity—which will thus be brought up to $(1 + \frac{1}{3})$ 979 ft. = 1088 ft. nearly, which is a very close approximation to the actual value given above.

This is not one of Newton's happiest conjectures—for, independent of the fact that such an assumption would limit definitely the amount of compression which air could undergo, and, besides, is quite inconsistent with the truth of Boyle's law for even moderate pressures, it would result from it that sound should travel slower in rarefied, and quicker in condensed air. Now, experiment shows that the velocity of sound is unaffected by the height of the barometer; and, indeed, it is easy to see that this ought to be the case. For in condensed air the pressures are increased proportionally to the increase of condensation, and the mass of a given bulk of air is increased in the same proportion. Hence, in a sound-wave in condensed air, the forces and the masses are increased proportionally, and thus the rate of motion is unaltered. But the temperature of the air *has* an effect on sound, since we know that the elastic force is increased by heat, even when the density is not diminished; and therefore the velocity of sound increases with the temperature at the rate of about $4\frac{1}{2}$ ft. per Fahr. degree, as is found by experiment.

Newton's explanation of the discrepancy between theory and experiment being thus set aside, various suggestions were made to account for it; some, among whom was Euler, imagining that the mathematical methods employed, being only approximate, involved a serious error.

The explanation was finally given by Laplace, and is simple and satisfactory. When air is *suddenly* compressed (as it is by the passage of a sound-wave), it is heated; when suddenly rarefied it is cooled, and this effect is large enough to introduce a serious modification into the mathematical investigations. The effect is in either case to *increase* the forces at work—for, when compressed, and consequently heated, the pressure is greater

than that due to the mere compression—and, when rarefied, and consequently cooled, the pressure is diminished by more than the amount due to the mere rarefaction. When this source of error is removed, the mathematical investigation gives a result as nearly agreeing with that of observation as is consistent with the unavoidable errors of all experimental data. It is to be observed that, in noticing this investigation, nothing has been said as to the pitch or quality of the sound, for these have nothing to do with the velocity. It must, however, be remarked here that, in the mathematical investigation, the compressions and rarefactions are assumed to be very small; i.e., the sound is supposed to be of moderate intensity. It does not follow, therefore, that very violent sounds have the same velocity as moderate ones, and many curious observations made during thunderstorms seem to show that such violent sounds are propagated with a greatly increased velocity. (See a paper by Earnshaw in the *Phil. Mag.* for 1861.) It is recorded that in one of Parry's arctic voyages, during gun-practice, the officer's command 'Fire' was heard at great distances across the ice *after* the report of the gun.

Since sound consists in a wave-propagation, we should expect to find it exhibit all the ordinary phenomena of waves (q.v.). Thus, for instance, it is *reflected* (see Echo) according to the same law as light. It is *refracted* in passing from one medium to another of different density or elasticity. This has been proved by concentrating in a focus the feeble sound of the ticking of a watch, and rendering it audible at a considerable distance, by means of a lens of collodion filled with carbonic acid gas.

Sounds *interfere* to re-enforce each other, or to produce silence; just as the crest of one wave in water may be superposed on the crest of another, or may apparently destroy all motion by filling up its trough. The simplest mode of showing this is to hold near the ear a vibrating tuning-fork and turn it slowly round its axis. In some positions, the sounds from the two branches re-enforce, in others they weaken, each other. But if, while the sound is almost inaudible, an obstacle be interposed between the ear and one of the branches, the sound is heard distinctly. Beats, which will shortly be alluded to, form another excellent instance.

To give an idea of the diminution of loudness or intensity of a sound at a distance from its source, let us consider a series of spherical waves diverging from a point. The *length* of a wave, as we know from the theory, does not alter as it proceeds. (Indeed, as we shall presently see, the pitch of a note depends on the length of the wave; and we know that the pitch is not altered by distance.) Hence, if we consider any one spherical wave, it will increase in radius with the velocity of sound, but its thickness will remain unaltered. The same disturbance is thus constantly transferred to masses of air greater and greater in proportion to the *surface* of the spherical wave, and therefore the amount in a given bulk (say a cubic inch) of air will be inversely proportional to this surface. But the surfaces of spheres (q.v.) are as the squares of their radii—hence the disturbance in a given mass of air, i.e., the loudness of the sound, is inversely as the square of the distance from the source. This follows at once from the law of conservation of energy (see Force), if we neglect the portion which is constantly being frittered down into heat by fluid friction. All sounds, even in the open air, much more rapidly in rooms, are extinguished ultimately by conversion into an equivalent of heat. Hence sounds really diminish in intensity at a greater rate than that of the inverse square of the distance; though there are cases on record in which sounds have been heard at distances of nearly 200 miles. But if, as in speaking-tubes and speaking-trumpets, sound be prevented from diverging in spherical waves, the intensity is diminished only by fluid friction, and thus the sound is audible at a much greater distance, but of course it is confined mainly to a particular direction.

As already remarked, the purest sounds are those given by a tuning-fork, which (by the laws of the vibration of elastic solids) vibrates according to the same law as a pendulum, and communicates exactly the same mode of vibration to the air. If two precisely similar tuning-forks be vibrating with equal energy beside each other, we may have either a sound of double the intensity, or anything less, to perfect silence, according to their relative *phases*. If the branches of both be at their greatest elongations simultaneously, we have a doubled intensity—if one be at its widest, and the other at its narrowest, simultaneously, we have silence, for the condensation produced by one is exactly annihilated by the rarefaction produced by the other, and *vice versa*. But if the branches of one be loaded with a little wax, so as to make its oscillations slightly slower, it will gradually fall behind the other in its motion, and we shall have in succession every grade of intensity from the double of either sound to silence. The effect will be a periodic swelling and dying away of the sound, and this period will be longer the more nearly the two forks vibrate in the same time. This phenomenon is called a *beat*, and we see at once from what precedes, that it affords an admirable criterion of a perfect *unison*, that is, of two notes whose pitch is the same. It is easy to see, by the same kind of reasoning, that if two forks have their times of vibration nearly as 1:2, 2:3, etc.—i.e., any simple numerical ratio—there will be greater intervals between the beats according as the exact ratio is more nearly arrived at.

We must now consider, so far as can be done by elementary reasoning, the various simple modes of vibration of a stretched string, such as the cord of a violin. Holding one end of a rope in the hand, the other being fixed to a wall, it is easy (after a little

practice) to throw it into any of the following forms, the whole preserving its shape, but rotating round the horizontal line. If the tension of the rope be the same in all these cases, it is easy to see that the times of rotation must be inversely as the number of equal segments into which the rope is divided; for the various parts will obviously have the same form; and the masses and distances from the axis of rotation being proportional to their lengths, the centrifugal forces (q.v.) will be as the squares of the lengths, and inversely as the squares of the times of rotation. But these centrifugal forces are balanced by the components of the tensions at the extremities, in directions perpendicular to the horizontal line; which are, by hypothesis, the same for all the figures. Hence the time of rotation is directly as the length of each segment. Now (see PENDULUM) any such rotation is equivalent to two mutually perpendicular and independent pendulum vibrations of the cord from side to side of the horizontal line. Thus, a violin string may vibrate, according to the pendulum law, in one plane, either as a *whole* (fig. 1), as *two halves* (fig. 2), as *three thirds* (fig. 3), etc.; and the times of vibration are respectively as 1, $\frac{1}{2}$, $\frac{1}{3}$, Nay, more, any two or more of these may coexist in the same string, and thus, by different modes of bowing, we may obtain very different combinations of simple sounds: a *simple sound* being defined as that produced by a single pendulum motion, such as that of a tuning-fork, or one of the uncomplicated modes of vibration of a string.

The various simple sounds which can be obtained from a string are called *harmonics* of the fundamental note; the latter being the sound given by the string when vibrating as a whole (fig. 1). For each vibration of the fundamental note, the harmonics have two, three, four, &c. Of these, the first is the octave of the fundamental note; the second the twelfth, or the fifth of the octave; the third the double octave; and so on. Thus, if we have a string whose fundamental note is C, the series of simple sounds it is capable of yielding is:

C, C₁, G₁, C₂, E₂, G₂ (B₇), C₃, D₃, E₃, &c.

Of those written, all belong to the ordinary musical scale except the seventh, which is too flat to be used in music. This slight remark shows us at once how purely artificial is the theory of music, founded as it is, not upon a physical, but on a sensuous basis.

To produce any one of these harmonics with ease from a violin string, we have only to touch it lightly at $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, &c. of its length from either end and bow as usual. This process is often employed by musicians, and gives a very curious and pleasing effect with the violoncello or the double-bass. The effect of the finger is to reduce to rest the point of the string touched; and thus to make it a point of no vibration, or, as it is technically called, a *node*.

In the case of a pianoforte wire, a blow is given near one end, producing a displacement which runs back and forward along the wire in the time in which the wire would vibrate as a whole. The successive impacts of this wave on the ends of the wire (which are screwed to the sounding-board), are the principal cause of the sound. But more of this case later.

The theory of other musical instruments is quite as simple. Thus, in a flute, or unstopped organ pipe, the sound is produced by a current of air passing across an orifice at the closed end. This produces a wave which runs along the tube, is reflected at the open end, runs back, and partially intercepts the stream of air for an instant, and so on. Thus the stream of air is intercepted at regular intervals of time, and we have the same result as in the *siène* (q.v.). In this case, there is *one* node only, viz., at the middle of the pipe. If we blow more sharply, we create two nodes, each distant from an end by $\frac{1}{4}$ of the length of the tube. The interruptions are now twice as frequent, and we have the first harmonic of the fundamental note. And so on, the series of harmonics being the same as for a string. We may easily pass from this to the case of an organ-pipe closed at the upper end. For if, while the open pipe is sounding its fundamental note, a diaphragm be placed at the node, it will not interfere with the motion, *since the air is at rest at a node*. That is, the fundamental note of a closed pipe is the same as that of an open pipe of double the length. By examining the other cases in the same way, we find that the numbers of vibrations in the various notes of a closed pipe are in the proportions 1:3:5:7: &c., the even harmonics being wholly absent.

There is another kind of organ pipe, called a reed pipe, in which a stream of air sets a little spring in vibration so as to open and close, alternately, an opening in the pipe. If the spring naturally vibrates in the time corresponding to any harmonic of the pipe,

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

that note comes out with singular distinctness from the combination—just as the sound of a tuning-fork is strongly re-enforced by holding it over the mouth-hole of a flute which is fingered for the note of the fork. If the spring and the tube have no vibration in common, the noise produced is intolerably discordant. The oboe, bassoon, and clarinet are mere modifications of the reed-pipe; and so are horns in general, but in them the reed is supplied by the lip of the performer. Thus, a cornet, a trumpet, or a French horn, gives precisely the same series of harmonics as an open pipe.

The statements just made as to the position of the nodes in a vibrating column of air are not strictly accurate, for the note is always found to be somewhat *lower* than that which is calculated from the length of the tube and the velocity of sound. Hopkins showed experimentally that the distance between two nodes is always *greater* than twice the distance from the open end to the nearest node. The mathematical difficulties involved in a complete investigation of the problem were first overcome by Helmholtz in 1859, in an admirable paper published in *Crelle's Journal*. The results are found to be in satisfactory accordance with those previously derived from experiment.

We have now to consider the subject of the quality of musical sounds; and one of its most important branches, what constitutes the distinction between the various vowel-sounds. It had long been recognized that the only possible cause of this distinction between sounds *musically identical* must lie in the nature of the fundamental noise, or, to express it differently, the nature of the periodic motion of each particle of air. But it appears that Helmholtz was the first to enter upon a complete examination of the point, both mathematically and experimentally, and the results he has arrived at form by no means the least remarkable of the contents of his excellent work, *Die Lehre von den Tonempfindungen*, recently published.

It was established by Fourier that any periodic expression whatever may be resolved into the sum of a number of simple harmonic terms, whose periods are, respectively, that of the original expression, its half, its third part, etc. Hence any periodic motion of air (i.e., any musical sound) may be resolved into a series of simple pendulum vibrations (i.e., pure musical sounds, such as those of tuning-forks), the first vibrating once in the given period, the second twice, and so on. These notes are, as we have seen, the several harmonics of the lowest. Hence the quality of a musical sound depends upon the number and loudness of the harmonics by which it is accompanied.

Two experimental methods were employed by Helmholtz, one analytical, the other synthetical. In the first he made use of resonance-cavities fitted to the ear, and giving scarcely any indication of external sounds until one is produced which exactly corresponds in pitch with the note which the cavity itself would yield. With a series of such cavities, tuned to the several harmonics of some definite note, the note was examined when played on various instruments, and when sung to different vowel-sounds. It was thus ascertained which harmonics were in each case present, and to what extent, producing the particular quality of the sound analyzed. The second method was founded on the fact, already noticed, that a tuning-fork gives an almost pure musical sound (i.e., free from harmonics). A series of tuning-forks, giving a note and its harmonics, were so arranged as to be kept constantly in vibration by an electro-magnetic apparatus. Opposite to each was fixed a resonance-cavity exactly tuned to it, and capable of being opened more or less at pleasure. When all the cavities were shut, the sound was scarcely audible; so that by opening them in various ways, any combination of harmonics might be made to accompany the fundamental note. These combinations were varied by trial, until the quality of the resultant sound was brought to represent as nearly as possible that of some vowel. The results of this second series of experiments coincided with those of the first. It appears from these investigations that the German U is the quality of a simple sound, though it is improved by adding faintly the two lowest harmonics; that O depends mainly on the presence of the third harmonic; and so on with the other sounds. It also appears, and it is well known by experience, that different vowel-sounds, to be sung with accuracy, require to be sung to different notes, the proper note being that for which the cavity of the mouth is adapted for the production of the accompanying harmonics which determine the quality of the particular vowel.

In strings and pipes, as we have seen, the higher notes are strictly harmonics of the fundamental note, and therefore the sounds of instruments which depend on these simple elements are peculiarly adapted for music. On the other hand, when, as in masses of metal, etc., the higher notes are not harmonics of the fundamental note, the mixed sound is always more or less jarring and discordant. Such is the case with bells, trumpets, cymbals, triangles, etc.; and, in fact, these sounds are commonly characterized as "metallic." To produce from such instruments a sound as pleasing as possible, they must be so struck that as few as possible of the higher notes are produced, and these as feebly as possible. Thus, for instance, to get the most pleasing sound from a piano-forte wire, it should not be struck at the middle, as in such a case the first, third, fifth, etc., harmonics of the fundamental note will be wanting. If, however, it be struck at about $\frac{1}{4}$ of its length from one end, the harmonics produced will be mainly the first five; and these all belong to the chord of the fundamental note. A valuable recent work is Lord Rayleigh's *Theory of Sound* (2 vols. 1878).

SOUND (A.S. and Ger. *suud*; according to Grimm, for *suund*, from the root of *swim*). a word signifying generally a strait or narrow sea-way, but applied specially to the

strait which leads from the Cattegat into the Baltic sea, between Sweden on the e. and the Danish island of Seeland on the west. It forms the usual passage from the n. to the Baltic Sea, is 40 m. long, and nearly 3 m. broad at its narrowest part, between the towns of Helsingborg and Elsinore. Its entrance is defended by the strong castle and fortress of Kronborg. See **ELSINORE**.

SOUND DUTIES, certain dues formerly payable to the Danish government by all vessels passing the sound or strait separating Sweden from Seeland. These duties originated in an agreement between the king of Denmark and the Hanse Towns in 1348, by which the former undertook to maintain the light-houses in the Cattegat, and the latter to pay duty for them. England became bound to pay duty by a treaty of date 1450, and other countries followed. The Sound duties were abolished on Mar. 14, 1857, by a treaty between Denmark and other powers. A pecuniary compensation of £3,386,528 (the share contributed by Great Britain being £1,125,206) was stipulated to be paid to Denmark, which was to be held bound to maintain the light-houses and superintending the pilotage of the Sound.

SOUNDING is the act of ascertaining the depth of the water. This is done either for purposes of navigation in piloting a ship among shoals or reefs, for ascertaining her position where the depth and nature of the bottom is previously known, or constructing a chart, etc. It is generally effected by means of a marked line, to which is attached a tapered lead, the bottom or foot of the lead being hollowed to receive some grease or tallow to which a portion of the soil at the bottom of the sea will adhere. Other methods have been devised for ascertaining depth, such as by a rotating fan-wheel, etc., but the first method is that still most generally used for ordinary depths.

SOUNDING, DEEP SEA. Until within a few years past, the term *deep sounding* was understood to be that in which a ship sounded to ascertain her position, and where the depth exceeded that which could be obtained with the lead thrown by the hand, or hand-lead; but the necessities of telegraphic communication across the ocean, by means of cables containing insulated wires, have caused the ocean to be measured at depths which were never before considered necessary, or even practicable.

The act of obtaining a deep-sea sounding may be said to consist of two parts—1. To get the sinkers to the bottom as quickly as possible with the line straight up and down; and 2. To bring a portion of the soil of the bottom, as a proof, to the surface; this necessitates the use of a small but strong line, with heavy sinkers and a detaching apparatus for freeing the sinkers when they reach the bottom, as from the smallness of the line and the great friction of all passing through the water, the strain of bringing the sinkers up would be too great for its strength. It may be stated that there is no difficulty whatever in obtaining a sounding, and regaining the sinker with bottom specimen, up to a depth of 1600 to 1700 fathoms ($1\frac{1}{2}$ m.), by means of a heavy lead fitted with a valved tube (fig. 1); but when the depth exceeds 2,000 fathoms the difficulties in obtaining a correct sounding increase in a compound ratio with the depth.

The first detaching apparatus (fig. 2) was devised by Mr. Brooke, a midshipman of the United States navy: it is extremely simple and efficient. It consists of a rod with a movable hook at the upper end, and a tube at the lower end. The sinker is a perforated shot, through which the tube passes, and by means of a ring below the hook by wire, the hook being kept up by the sounding-line; the tube is filled with cut quills. When the weight touches the ground, the line is slackened, the hook falls, and the suspending wire being freed, the shot slides off, while the quills being thrust into the soil, secure a small portion, which is brought up with the rod.

Many different kinds of detaching apparatus have been invented since, but that made use of on board H.M.S. *Challenger*, in her deep-sea exploration voyage, is but a modification of the original Brooke's machine. The Hydra machine (fig. 3) consists of a tube of iron, 2½ in. in diameter and 4½ ft. in length, *a*; the lower 12 in., *b*, is separate from, but screws to the upper part at *c*; it is fitted with a butterfly valve at the lower end, to retain the bottom specimen. At the upper end of the tube is a piston-rod *d*, which moves freely in the tube. To the upper part of this rod is fixed a steel spring, bent in a bow *e*; a slit in the spring is adapted to the hook *f*, which protrudes beyond the spring when the latter is forced back. The sinkers (fig. 4) are cast-iron disks of half a cwt. each, the hole through the center, *a*, being sufficiently large for the sounding-tube to pass through.

They are made to fit each other by means of small conical protuberances on the one side, and corresponding hollows on the other, *b*, so that when placed one on another, the groove *c* in the one weight corresponds to that on the other. The upper and lower sinkers differ a little in form.

When a sounding is to be taken the machine is prepared as in Fig. 5, a wooden stand being used for the purpose. The sinkers *a*, *a*, are piled to the required weight, say 4 cwt.; the tube is then passed through them, and an iron ring (with a bight of iron wire attached) *bb*, is passed on the lower end of the tube, and the wire led along the continuous grooves on each side of the sinkers *c*, and the bight passed over the hook *d*, the spring being pressed back. When the weight of the sinkers rests on the ring, and is supported by the wire, the weight keeps the spring pressed in; but as soon as the sinkers touch the ground and the weight is relieved from the wire, the spring throws it off the hook, and the tube is drawn clear through the sinkers.

When the tube, with sinkers complete is ready, it is carefully hoisted over the side, lowered gently into the sea, and eased down one or two hundred fathoms before being let go. It is then let go, and the passing of each 100-fathoms mark is timed and recorded in a printed form made to contain all the particulars of the sounding.

Sir William Thomson, F.R.S., has invented a mode of deep-sea sounding by using piano wire instead of hempen lines, which promises to obviate much of the present difficulty in deep-sea sounding.

Many very deep soundings are on record, but the two deepest well-authenticated soundings are among those obtained by H.M.S. *Challenger*. The first was about 80 m. to the northward of the Virgin islands, the depth being 3,875 fathoms, or nearly 4½ miles. Unfortunately, not thinking that so near the islands so great a depth would be found, only 3 cwts. of sinkers were used (the usual quantity for such extreme depths being 4 cwts.); this weight, with a one-inch line, took an hour and twelve minutes to reach the bottom. As the ascertainment of the sinkers reaching the bottom depends on the time intervals, it may be stated that the line let free to run with this weight would take about 43 seconds running out the first 100 fathoms, and the time increases as nearly as possible three seconds for each successive 100 fathoms; so that when the interval is prolonged beyond this rate, the sinker has reached the bottom. On this occasion the last 50 fathoms ran out at the rate of 2 minutes 36 seconds per 100 fathoms. The other was to the n. of New Guinea, where the depth was 4,475 fathoms, or more than 5 miles.

An idea of the average depth of the n. Atlantic ocean may be had from the fact that of 108 soundings obtained by the *Challenger*, 48 were between 1000 and 2,000 fathoms, 56 between 2,000 and 3,000, while only the other 4 exceeded 3,000. See DREGGÉ; DREDGING.

SOUND, REFRACTION OF. Sound moves in straight lines, in spherical-fronted waves; and any small beam thereof, if unequally retarded or accelerated on either side, bends toward the side of retardation so that the acoustic impulses, always directly radial from the face of the sound wave, vary in their point of available impact, as the "air mirror" of sound turns distorted by disturbance. 1. Sound passing from air into water, or water into air, provides the only example really available, of acoustic refraction by difference of elasticity. Sound, encountering a strong opposition in the density of fluids, and a still greater in solids, yet avails itself of the enormously disproportioned intensity of resilience or elasticity. The waves of sound arising from an explosion under water are conveyed by the water long distances; but when cast off into the air above the explosion, the few and retarded vibrations diverge so enormously at such a height, by reason of the flat reflector of the water at the surface, and the hollow arc of force beneath generated by the explosion, as to become nearly inaudible, with their low velocity. Guns at sea, fired on a horizontal with an energy far stronger than the inertia of the air, reverse this; and with sound waves compressed between the force of the cannon and reflection from the water, transmit their force to a great distance. 2. The refraction of sound through differences of *density* has been shown by a convex lens of carbonic acid inclosed in a collodion film, transferring the ticking of a watch to a focus, where it was heard only on the interposition of the lens. The wave front received a concave form on its entrance, accelerated on its exit at the rim, its lagging center became more concave, the normals converging to a focus. 3. Prof. Stokes in 1837 first suggested the refraction of sound by varying velocities of *wind*. Of two winds at different levels, the upper, if the faster, will retard an opposing sound wave most, and so elevate the sound focus; if the sound advanced with the wind, the focus would lower, on account of the "drag" of the lower layers. Prof. Henry in 1865, ignorant of the theory, confirmed the above points, observing the audibility of a sound signal against the wind, heard at a ship's mast-head, and that the cloud shadows exceeded the ground wind in speed. 4. Prof. Reynolds, 1874, showed first the refraction of sound from difference of *temperature*. Since the difference in velocity of sound per second is 1 ft. to 1° Fahr., so when the lower air is warm, the sound beams are tilted up by increased speed below, and when cold, the upper strata bend over and depress the focus; in either case favoring audibility at a distance. Thus is explained the ease of extended hearing in Arctic regions.

SOUP (A.-S. *sup-an*, to sip or sup) is a well known form of food, obtained either from flesh and vegetables, or from vegetables alone. Before noticing the most important varie-

ties of soup, it is expedient that we should have a clear idea of what soup really is, or, in other words, what relation soup bears to the solid ingredients which enter into its composition. The researches of Liebig have thrown much light upon this point. When finely chopped muscular flesh (or butcher-meat) is lixiviated with cold water, and exposed to pressure, there is left a white fibrous residue consisting of muscular fibers, of connective or articular tissue, and of vessels and nerves. This lixiviated flesh is of precisely the same quality from whatever animal it is obtained, communicates no flavor to water in which it is boiled, cannot be masticated, and as Liebig observes, "even dogs reject it." When the cold water has taken up all that it is capable of extracting, it is found that it has dissolved from 16 to 24 per cent of the dry chopped flesh. This watery infusion contains all the savory and much of the nutrient matter of the flesh, and is usually of a reddish tint, from the presence of a little of the coloring matter of the blood. On gradually heating it to the boiling-point, it is observed that the albumen of the flesh (varying in amount from 2 to 14 per cent, according as the animal was old or young) separates in nearly colorless flakes when the temperature has risen to 133°, while the coloring-matter of the blood does not coagulate till the temperature rises to 158°. The liquid is now clear, and of a pale yellowish tint; and as it reddens litmus-paper, it must contain a free acid. The infusion of flesh thus prepared has the aromatic taste and all the properties of a soup made by boiling the flesh. When evaporated it becomes dark-colored, and finally brown; and on ceasing to lose weight, there is obtained a brown, somewhat soft mass of "extract of flesh," or "portable soup," amounting to about 12 per cent of the weight of the original flesh, supposed to be dried. "This extract," says Liebig, "is easily soluble in cold water, and when dissolved in about 32 parts of hot water, with the addition of some salt, gives to this water the taste and all the peculiar properties of an excellent soup. The intensity of the flavor of the dry extract of flesh is very great; none of the means employed in the kitchen is comparable to it in point of flavoring power." The soup thus made of the flesh of different animals (as, for example, the ox and the fowl) possesses, along with the general flavor common to all soups, a peculiar taste, which distinctly recalls the smell or taste of the roasted flesh of the animal employed. In order to obtain the strongest and best-flavored soup, chopped flesh should be slowly heated to boiling with an equal weight of water; the boiling should only be continued for a few minutes (for prolonged boiling only gives rise to the formation of gelatine, a substance of no nutritive value, from the connective tissue of the flesh), and the soup should be then strained off from the solid residue. As a matter of economy, it is often desirable that the meat should be left in an eatable state, which is not the case with soup made according to the preceding directions. To attain this end, the joint or mass of flesh should be set on the fire with cold water, which should be gently heated to boiling; the flesh thus undergoes a loss of soluble and savory matter, while the soup becomes richer in them. The thinner the piece of flesh is, the greater is the loss which it experiences. Hence the method of boiling which yields the best soup, gives the driest, toughest, and most tasteless meat. "The juice of flesh," says Liebig, "contains the food of the muscles; the muscular system is the source of all the manifestations of force in the animal body; and in this sense we may regard the juice of flesh as the proximate condition of the production of force. Soup is the medicine of the convalescent, and as a means of restoring the exhausted strength, it cannot be replaced by any article of the pharmacopœia. Its vivifying and restoring action on the appetite, on the digestive organs, the color, and the general appearances of the sick, is most striking."

Most soups contain an admixture of meat and vegetables in their preparation; but many good soups can be made either entirely without the use of flesh, or with fish in place of flesh. In the former class may be placed pea-soup (which is, however, much improved if a piece of bacon enters into its composition), green-pea soup, carrot-soup, potato-soup, asparagus-soup; while for fish-soup, pike, tench, and eels are specially used. A collection of excellent recipes for such soups will be found in *A Handbook of Foreign Cookery*, published by Murray in 1845. The basis of all good soups, excepting those in the preceding category, is *stock*, or broth made from all sorts of meat, bones, remains of poultry or game, etc., put together, and stewed in the *stock-pot*.

Public attention was some time ago called to Liebig's *soups for children*. This preparation, which is hardly entitled to be called a soup, as the word is generally understood in this country, is made as follows: Take 1 oz. (one large table-spoonful) of seconds flour, and mix it very slowly and carefully with 10 oz. of cold skimmed milk, until the whole is smooth; add $7\frac{1}{2}$ grains of bicarbonate of potash, dissolved in a tea-spoonful of water (if 60 grains of the potash be dissolved in 1 oz. of water, 1 tea-spoonful must be used at a time), and then heat it gently to the boiling point, and keep it boiling for five minutes. Stir it well while it is being heated; add to the whole fluid 1 oz. (1 large desert-spoonful) of malt flour (malt ground in a coffee-mill and sieved), mixed with 2 oz. of water, and stir it well. Cover the pan, and let it stand for half an hour in water which is nearly boiling, so as to keep the fluid warm; then strain through a fine sieve, and bottle it. This quantity is sufficient for a day's supply for a child under two years of age, and a quart of milk should be added to it.

SOUR-SOP, *Annona muricata*, a small tree of the West Indies, which bears a white, pulpy, succulent fruit, similar to the custard-apple, slightly acid in taste, weighing from 2 to 3 lbs., and much relished by the people of the West Indies.

SOUTANE (Ital. *sottana*, Fr. *soutane*, Lat. *talariis*, i.e., *vestis*, "a garment reaching to the ankles"), the name usually given in France and Italy to the outer garment worn in civil life (commonly with a flowing over-dress or robe) by Roman Catholic ecclesiastics, when the strict law of clerical costume is in force; and also ordered to be worn under the priestly robes used in the public ministerial offices of the clergyman. In England it was called cassock. It is not peculiar to bishops, priests, or even to clerics in holy orders, but may be worn by all who have received even the tonsure (q.v.). Indeed, the council of Trent (*Dec. de Reform.*, sess. 23, c. vi.) declares that no cleric shall be held entitled to the "privilege of clerics" unless he shall wear the soutane. The ordinary material of the soutane is serge or woollen cloth; but it is often of more precious stuff. The color for the secular clergy is commonly black; but dignitaries wear other colors. Thus, the pope wears a white—cardinals, a red—bishops, a violet—many canons, a blue soutane; and in religious orders and collegiate bodies the color is regulated by special laws, which need not be particularized. Its use, as obligatory, was very general in former times, but it has gradually fallen off since the French revolution. It is but little worn in Germany, even in the southern provinces; and in Italy, except in the former papal states, it is much less universal than it was 30 years since. In all places, however, it is strictly required to be worn under the sacred vestments by a priest administering the sacraments, or otherwise officiating publicly.

SOUTH, ROBERT, D.D., the son of a London merchant, was b. at Hackney in 1653. His earlier education he received at Westminster school, of which Dr. Busby was then master; and in 1651 he became a student at Christ Church, Oxford. In 1655 and 1657 successively he took his degrees of bachelor and master of arts; he was ordained in 1658; and in 1660 he was appointed university orator. In this function he was fortunate enough to please the lord chancellor Clarendon on his installation as chancellor of Oxford, and, in reward of his complimentary periods, South was made his domestic chaplain. In 1663 he took his degree as doctor of divinity; the same year saw him promoted to a prebendary stall at Westminster; and in 1670 he became a canon of Christ Church, Oxford. In 1677 Laurence Hyde, son of the chancellor, being sent to Poland as ambassador, he was accompanied thither by South, who had been his tutor, and was the object of his warm regard. Shortly after his return, the rectory of Islip, in Oxfordshire, was conferred upon him, and he was made chaplain-in-ordinary to Charles II. He might readily now have become a bishop, but through this and the succeeding reign he steadily continued to decline the offers of higher preferment pressed upon him. The designs of James II., tending to a Roman Catholic revival, he regarded with deep disapproval and alarm; but so strong was his sense of the duty of submission to the reigning monarch that he declined all share in the conspiracy to oust him in favor of the prince and princess of Orange. When, however, the revolution was accomplished, he gave in his adhesion to it. But, to his honor, he refused to profit in the way of preferment, by the deprivation of such of the higher dignitaries of the church as could not conscientiously go along with him in recognition of the new order of things. A staunch and even bigoted adherent of the church of England, he continued to wage unsparring war from the pulpit, and with his pen, against Puritanism and every other form of dissent, occasionally occupying himself with discussions more strictly theological, till in July, 1716, death came to conclude his controversies. He is now chiefly remembered by his sermons; they are masterpieces of vigorous sense and sound English, and abound in lively and witty turns, not always in severely decorous consonance with the seriousness of the subject-matter. As a man, South seems to have been of sound and estimable character; of pure life and unblemished integrity. His entire works were sent from the Clarendon press in 7 vols. (1823), 5 vols. (1843). An edition in 2 vols. appeared in London in 1850.

SOUTH AMERICA. See *AMERICA, ante*.

SOUTHAMPTON, a co. in s.e. Virginia, bordering on North Carolina, and bounded on the e. by Blackwater river, and s.w. by the Meherrin river; crossed by the Seaboard and Roanoke, and the Atlantic, Mississippi and Ohio railroads; drained by Nottaway river; 600 sq.m.; pop. '80, 18,012. The surface is mostly level, and partly covered with forests of cypress and pine, the latter yielding large quantities of tar and turpentine; the soil is sandy. The principal products are wool, corn, oats, and sweet-potatoes; cattle, sheep, and swine are raised. Co. seat, Jerusalem.

SOUTHAMPTON, a municipal and parliamentary borough, important sea-port, and county of itself, in the s. of Hampshire, 78 m. s.w. of London by the London and South-western railway. It occupies a peninsula at the head of Southampton Water, and between the estuary of the Test or Anton on the w. and s., and the mouth of the Itchen on the east. The High street, which is the principal thoroughfare, extends from the water-side to the Bargate, and thence to the outskirts of the town. Crossing the High street at right angles are many important streets, and handsome lines of new houses are found in the northern and western suburbs. Southampton is furnished with the usual municipal and other institutions common to all thriving towns. St. Michael's church, the oldest in the borough, contains Norman tower arches, and several of the private houses are of Norman architecture. The *Domus Dei*, or God's house, dates from the end of the 12th c., and is one of the earliest hospitals in England. The docks can float the largest steamers, and have been greatly extended and improved; the revenue of the Dock com-

pany in 1873 was £103,426. Southampton is the place of departure and arrival of the West India and Brazil, the Mediterranean, East Indian, China, and Australian, and the South African mail steam-packets. There is considerable traffic between Southampton and the Channel Islands and French coast, and also a large cattle-trade with Spain and Portugal. Its harbor is perhaps the most motley and picturesque in England, being frequently crowded with Lascars, Creoles, Arabs, etc., and, on the arrival of mail-steamers, with Indian and American planters, East Indian nabobs, foreign dignitaries, naval officers, and other British and foreign officials in every variety of costume. In 1875, 1738 vessels of 697, 255 tons entered, and 1045 of 588,479 tons cleared the port. Yacht and ship building and engine-making are actively carried on, and there is an extensive general trade. Southampton is also a fashionable resort in summer. It returns two members to the house of commons. Pop. '71, 53,741.

Southampton supplanted the ancient *Claesentum*, which stood one m. to the n.e., and its foundation is ascribed to the Anglo-Saxon. It is called Hamtun and Suth-Hamtun in the Saxon Chronicle. After the conquest Southampton, from which there was ready transit to Normandy, began to prosper rapidly, and in early times it traded with Venice and Bayonne, Bordeaux and Rochelle, Cordova and Tunis. A great part of it was burned by the combined French, Spanish, and Genoese fleets in 1338, and in the following year its defenses were strengthened. Southampton is the birthplace of Isaac Watts (to whom a monument has been erected in the West park), and of Thomas Dibdin.

SOUTHAMPTON, HENRY WROTHESLEY, 3d earl of, 1573-1624; b. England; a friend of the earl of Essex, with whom he went in the expedition to Cadiz and afterward to Ireland. He was convicted, though he strenuously asserted his innocence, of complicity in the treasons of Essex, attainted, and condemned to death; but Elizabeth stayed the latter penalty, and the former was reversed by parliament early in the reign of James I. He was active in the colonization of America, and was governor of the Virginia company. He was imprisoned in the tower in 1621 for his opposition to the arbitrary measures of Charles I.; after his release he commanded a regiment in aid of the Dutch against the Spanish, and both he and his son died of a fever contracted in the Netherlands. He is best remembered as the patron to whom Shakespeare dedicated *Venus and Adonis* and *The Rape of Lucrece*.

SOUTHAMPTON WATER, a fine inlet, stretching n.w. from the point at which the Solent and Spithead unite. It is 11 m. long and about 2 m. wide. The Isle of Wight, which intervenes between the Southampton Water and the channel, forms a magnificent natural breakwater, and occasions a second high-water two hours after the first. Southampton Water receives the Test or Anton, Itchen, and Hamble.

SOUTHARD, SAMUEL LEWIS, LL.D., 1787-1842; b. N. J.; educated at the college of New Jersey, and called to the bar. He was appointed associate justice of the New Jersey supreme court in 1815; elected U. S. senator, 1821; appointed secretary of the navy, 1823; was for short periods acting secretary of the treasury and of war; attorney general of New Jersey in 1829; and governor, 1832. He was again a member of the U. S. senate from 1832 to his death, and president of that body in 1841.

SOUTH AUSTRALIA. Recent legislation has rendered this name a misnomer by extending the boundaries of the colony so as to include the entire center of the Australian continent comprised between the Southern and the Indian oceans, and between the 129th and the 141st degrees of e. long—an area of 914,730 sq. miles.

Character of the Soil, etc.—The northern portion of this vast territory enjoys an abundant rainfall, and is watered by numerous streams and rivers, some of them, as the Victoria and the Adelaide, navigable for a considerable distance by ships of burden. The soil is fertile, and suitable for the cultivation of tropical productions of every description. In connection with the construction of the overland telegraph across the center of the Australian continent, this region has become better known as being suitable for settlement, already commenced.

The great central region opened up by the explorations of Stuart and McKinlay, and the country to the n. of lat. 33°, may be described as suited only for pastoral purposes on account of the irregularity of the rainfall and the scarcity of permanent water; and with the exception of a few patches along the coast the same description will apply to the country to the westward of gulf St. Vincent, in 138° e. long. The south-eastern division of the colony, comprised between lat. 33° and the Southern ocean, and between gulf St. Vincent and the eastern boundary of the colony, includes every variety of soil, ranging from absolute sterility to the highest degree of fertility, great portion of it being probably unsurpassed by any region in its adaptability both in soil and climate for the growth of wheat, the vine, and the olive. This region is moderately timbered, the principal varieties being the gum, the stringy bark, and the pine, all extremely useful for fencing and building purposes.

Climate.—A country extending over 27° of latitude must necessarily embrace great varieties of temperature; but the climate, owing to prevailing aridity, appears to be, upon the whole, healthy and remarkably free from epidemic diseases. The average annual mortality during 10 years has been found, in the settled districts, to be 15 per 1000 as compared with 23 per 1000 in England. Nearly half of the deaths are those of

children. The hottest months are December, January, February, and March. During these months hot winds occasionally blow. But the same dryness of the air which accounts for the great exaltation of the temperature, renders it more endurable than might at first be supposed, and Europeans are able in the hottest weather to carry on harvest labor without danger. Careful observations, taken in the agricultural part of the colony (i.e., s. of lat. 33°), and extending over a series of years, show the mean temperature during the four hot months to average 73.60°, and during the eight cold months 56.3°, the extreme range being from 117° to 32°. The rainfall in the n., or purely pastoral district, is as low as 7.947 in.; while in the s., or agricultural district, it averages as much as 48.59 inches.

Physical Aspect.—The surface of the country alternates between open plains and wooded ranges of moderate elevation, which inclose many beautiful and fertile valleys. The principal ranges are the Flinders range, which trends northward from the e. coast of Spencer gulf to the neighborhood of lake Torrens, in lat. 30°, where it branches out into numerous spurs; and the Mount Lofty range, running nearly parallel with gulf St. Vincent from its head-water in lat. 34° to its termination at cape Jarvis. The Mount Lofty ranges rise to a height of about 2,600 ft., running about n.e. and s.w., having a breadth of over 15 miles. This district abounds in picturesque scenery, the summits being well wooded and the slopes of great beauty and fertility, affording eligible building-sites, and producing in the highest perfection many English fruits and vegetables, which fail to thrive on the hotter and more arid soil of the plains.

Throughout South Australia the deficiency of running water is remarkable; in fact, for nearly 1200 m., following the indentations of the coast from the western boundary of the colony to the estuary of the Torrens, in gulf St. Vincent, not even a brook of permanent fresh water finds its way into the sea. To the eastward this deficiency is to some extent compensated, partly by the streams which take their rise in the Mount Lofty range, the principal of which are the Torrens, the Onkaparinga, the Gawler, and the Sturt, but mainly by the Great Murray. See AUSTRALIA, VICTORIA. Unfortunately for the complete utilization of this magnificent stream, its embouchure, in long. 139° e. is exposed to the full force of the southern ocean, which meeting the current, throws up a shifting bar, rendering the entrance from seaward dangerous, and practicable only for steamers drawing under 7 feet. To counteract this drawback, a tramway has been constructed from Goolwa, connecting the river with Victor Harbor, a small but well-sheltered haven situated in Encounter bay. Another railway to connect North-West Bend, 159 m. up the river, with Port Adelaide, is contemplated, and has been completed as far as Kapunda, 57 m.; a northern extension runs to Burra, 100 m. inland.

Divisions, Towns, etc.—The colony naturally falls into three sections—South Australia proper, Central Australia, and the Northern Territory. The 35 counties serve for electoral purposes; the most important division is into districts, of which there were over 100 in 1879. Besides Adelaide, the capital, with its 32,000 inhabitants, there are six townships with over 2,000 and other seven with more than 1000. Port Adelaide, 7½ m. from the capital, is the chief harbor; but there are several excellent minor ports.

Mineral Wealth, etc.—The mineral wealth of South Australia is great, the principal metals being copper, lead, and iron; the last is of the finest quality, but, in the absence of coal, cannot be profitably worked. The principal copper-mines are the Burra-Burra and the Kapunda, to the n.e. of St. Vincent gulf; the Wallaroo and Moonta, on York's peninsula, which intervenes between St. Vincent and Spencer gulf.

Colonization.—The country, the conformation and physical conditions of which we have above described, was selected in 1837 as the site on which to test what was then a new principle in colonization, known as the Wakefield theory, from the name of its author, Edward Gibbon Wakefield. The principle may be expressed in a single sentence thus: "The waste lands of the crown, though entirely valueless prior to the application of labor and capital, acquire value according as these elements of wealth are applied to them in due proportions or otherwise; and the proceeds of the sale of these lands, if properly administered, will suffice to defray the cost of transporting the labor required for their cultivation, at the same time relieving the mother-country from the pressure of able-bodied pauperism." A second and scarcely less important problem in economic science was put to the test on the same occasion, viz., "The future revenues of a new colony, supplemented, if necessary, by a lien upon the lands, afford a basis of credit available for raising funds adequate to defray the cost of outfit and first settlement, and therefore the appropriation of the taxes of this country for such purpose is unnecessary and inexpedient. Owing partly to an unfortunate delay in putting the first settlers in possession of the lands which they had paid for, but mainly to a monopoly by the government of the labor imported by the purchase-money of those lands, production was retarded during the first three years of the settlement; and the necessities of life, which, but for this mistaken policy, might have been produced on the spot in profuse abundance, had to be imported at enormous cost, and paid for out of capital, by which means the colony was reduced to the verge of bankruptcy. In 1841 the sound principles to illustrate which the colony was founded, were, for the first time, allowed to come into play. Government interference with the labor-market ceased; and within three years from this change of policy, breadstuffs and other agricultural products were exported from South Australia in such quantities as to glut the markets which previously supplied her

necessities. From that date the progress of the colony, notwithstanding the attractions of the adjacent gold-fields, has been remarkable. The traveler may drive for many hundreds of miles over excellent roads, amidst corn fields and vineyards cultivated by yeomen proprietors. South Australia has become the granary of the eastern settlements; and the subjoined statements, compiled from statistics published by government, exhibit a degree of prosperity probably unsurpassed in any country or in any age.

The waste lands are disposed of in fee-simple by public auction at the upset price of 20s. per acre, and lands, once passed the hammer, may be purchased at that price without further competition. For pastoral purposes lands are granted to the first applicant for a lease of 14 years at an almost nominal rent. The system of free selection within certain surveyed districts now obtains in South Australia, whereby land to the amount of 640 acres can be purchased on credit, at the ordinary upset price, on a written application to the land office, and on the signing of an agreement, of which the main conditions are—the immediate payment of 10 per cent. of the purchase-money, and its payment in full in six years, or optionally, of half, on further interest on the remaining half, and the full payment in ten years; personal occupancy of the land; and the executing of improvements to the value of 7s. 6d. per acre before the end of the third year, and of 10s. before the end of the fourth. Land, open to the public for five years without being sold, may be leased in blocks of 3,000 acres for ten years, with the right of purchase at the upset price during the lease. Under an act known as the Torrens act the difficulties, delays, and expenses attendant on the English system of conveying are removed, and land is rendered as easy of transfer, mortgage, and settlement as property in shipping. The great advantages secured by South Australia under this act have caused it to be adopted throughout the Australian colonies.

Government, etc.—There are two houses of parliament, both elective. The whole colony is thrown into one electoral district for electing members to the council on a low property franchise, and for a period of 12 years. Members of the assembly are elected by universal suffrage for 3 years. Voting for both houses is by ballot. The executive government is dependent on parliamentary majorities, as in England. No pecuniary aid is given by government to any religion, and all churches are placed on a footing of perfect equality. The system of public education is modeled on the Irish national system. Attendance is compulsory.

In 1876 the pop. of South Australia amounted to 213,271, exclusive of aborigines, who numbered in the settled districts 3,953. The imports for 1876 were of the value of £4,576,183; and the exports, £4,816,170. The exports consisted chiefly of corn, wool, and copper. In the same year, the total export of corn amounted in value to £1,171,529; wool, of which the value is not given, weighed 36,435,346 lbs.; and copper 109,269 tons, valued at £427,403. The revenue, derived principally from the sale of crown lands and customs dues, amounted in 1877 to £1,331,925; the expenditure, to £1,415,703; and the public debt, spent in reproductive works, to £4,237,030. In 1876 the land under cultivation amounted to 1,444,586 acres, of which 898,820 were wheat; 13,724 barley; 3,640 oats; 4,972 vineyards; 4,854 peas; 5,941 potatoes; 7,446 orchards. There were 10,164 horses, 219,240 horned cattle, and 6,179,395 sheep in the colony at the end of 1876. Including lines approaching completion, South Australia had in 1877, 371 m. of railway, whose total cost to the end of 1876 was £2,360,000; receipts for 1876, £201,190. The colony has an extensive system of electric telegraphs. An overland line, constructed at the expense of the South Australian government, and opened in 1872, runs from Adelaide to Port-Darwin, across Central Australia, a distance of 2,000 m., and through junction with the Anglo-Indian line, connects Australia with all the great centers of civilization. The places of worship in the colony, in 1871, numbered upward of 568, with accommodation for 110,067 persons. The number of schools in 1871 was given as 307; of scholars, 15,791; the teachers numbered 298; and the average annual cost of each scholar was £1, 18s. See an elaborate descriptive work on the colony, *South Australia*, by William Marcus (1876).

SOUTH BEND, a city of Indiana, on the s. bank of the St. Josephs river, near the border of Michigan, on the Southern railway, 85 m. e. of Chicago. It contains a handsome court-house, the Catholic university of Notre Dame, female academy and convent, Northern Indiana college, bank, 2 newspapers, 6 churches, and large manufactories. Pop. '70, 7,206; '80, 13,279.

SOUTH BETHLEHEM, a t. in Northampton co., Penn., on the Lehigh valley, and the Northern Pennsylvania railroads, and the Pennsylvania and New York canal, 12 m. s.w. of Easton, 5 m. e. of Allentown; pop. 3,556. It is connected by a bridge with Bethlehem, is lighted with gas, and has excellent facilities for transportation. It contains St. Luke's hospital, St. Michael's hall, a water cure establishment, a literary association, and the Lehigh university, a fine building situated on a hill, and which was endowed by Asa Packard, with scientific and polytechnic departments, and schools for mining, metallurgy, and civil engineering. The surrounding country contains almost inexhaustible deposits of iron, coal, and slate, and the richest zinc deposits in the world. It has manufactories of iron and steel rails, brass, shovels, and organs; a brick yard; chain, machine, and zinc works; an iron foundry, a planing mill, and a brewery, also large deposits of coal and slate.

SOUTH CAROLINA (*CAROLINA, SOUTH, ante*) was settled by English colonists, who founded Port Royal in 1703, and 10 years later removed to the present site of Charleston, the territory at that time being only a part of the Carolina province. Many French Huguenots found their way thither in 1685, and Scotch, Irish, Swiss, and German emigrants followed. In 1729 the province was divided into North and South Carolina by Charles II., and from that time on it increased in population and prospered, notwithstanding much molestation by the Indians and also by the Spaniards in Florida. During the revolution important battles occurred at Charleston, Fort Moultrie, Camden, King's Mountain, Cowpens, and Eutaw Springs. A state constitution was adopted March 26, 1776, and the constitution of the United States was ratified in 1788. From the first the state was prominent in the south. Its wealth increased rapidly and its political leaders gave it distinction and influence. The most important event in its history for seventy years was brought about by John C. Calhoun, who in 1832, with other leading men of the state, attempted to nullify certain acts of congress imposing a tariff, believing that it bore unjustly on the interests of the state. During some months this defiance of the national authority threatened future trouble; but prompt measures adopted by president Jackson restored order. The desire to maintain extreme state-rights, however, continued to be prominent in South Carolina politics; and in 1860, when indications of civil war were apparent, it was the first state that seceded from the union. The legislature met in Charleston, and Dec. 20 passed an ordinance of secession by a unanimous vote. In the following April the bombardment of Fort Sumter, in Charleston harbor, precipitated the war, and during the next four years the state suffered severely, its harbors either being blockaded or captured one by one, and much of its property being destroyed by federal troops on the great march through the state, under gen. Sherman. After peace was declared and reconstruction begun, a great deal of trouble ensued for several years through the constant disagreement between the whites and the colored people and their leaders. A convention held in Columbia, in Sept., 1865, repealed the ordinance of secession and declared slavery abolished. The state was put under military surveillance; a registration of voters held, which resulted in qualifying 73,932 colored and 46,346 white voters; and a general election followed. The new legislature was largely composed of colored men; and many of the state officers and some of the members of congress were also colored. The constitution, which, after some delay, was framed and accepted, was similar to those required of other southern states for their re-admittance to the union. Altogether, South Carolina has had more difficulty in regaining its former prosperity than any of the other former confederate states except Louisiana.

Of the total population in 1870, 343,932 were males and 261,704 females; 697,532 were of native and 8,074 of foreign birth. There were 151,105 families, with an average of 4.67 persons to each, and 143,435 dwellings, with an average of 4.92 to each. About 55,000 whites, 10 years old or more, and 235,000 colored persons, could neither read nor write. Of the 233,301 persons, 10 years old and over, engaged in occupations, 163,528 were field laborers, 42,516 farmers and planters, 31,833 engaged in professional pursuits, 16,214 domestic servants, 10,654 laborers not specified, 8,470 in trade, and 13,794 in manufactures and mining industries. By the last census, 1880, the total pop. was 955,806, of whom 391,071 were white and 604,235 colored.

The state has little waste land, and produces cotton, rice, tobacco, maize, oats, rye, barley, sweet and Irish potatoes, peas, beans, etc. The soil comprises six varieties—the tide swamp, adapted to the culture of rice; inland swamp, to rice, cotton, corn, and peas; salt marsh, to long cotton; oak and pine, to long cotton, corn, and potatoes; oak and hickory, to short cotton and corn; and pine barren, used for fruits and vegetables. The climate in most parts of the state is mild and even. At Charleston the mean temperature in spring is 65°; summer, 80°; autumn, 68°; winter, 51°. The yearly rainfall is about 48 inches. In 1870 there were 12,105,280 acres of land in farms, 3,010,530 acres of which were under cultivation and 6,443,851 in woodland. The products were 317,700 bush. of spring and 465,910 of winter wheat, 33,165 of rye, 7,614,207 of Indian corn, 613,593 of oats, 4,752 of barley, 460,378 of peas and beans, 1,425,417 of potatoes, 7,850 of clover seed, 10,635 tons of hay, 224,500 bales of cotton, 32,301,825 lbs. of rice, 31,895 of tobacco, 1,451,980 of butter, 194,253 of honey, 11,404 of wax, 1055 hhds. of cane sugar, 13,179 galls. of wine, and 436,882 of cane and 182,585 of sorghum molasses. During the same year the pitch-pine forests yielded 3,421,262 galls. of turpentine and 313,146 hhds. of rosin, worth together about \$2,490,000. In manufactured products the state ranks only thirty-second, but within the past few years these industries have begun to command more attention. The number of manufacturing establishments in 1870 was 1584, chiefly cotton and woolen mills, saw mills, flouring and grist mills, and manufactories of cotton-seed oil, turpentine oil, rosin, tar, pitch, and phosphates for fertilizing. The water-power of the upper and middle counties is ample, but in the coast region steam is generally employed. About \$5,400,418 is invested in these industries, and the annual products are valued at \$9,858,987. The mining industry in 1870 was reported to consist of 5 mines or quarries, employing 148 hands and \$137,000 capital, and yielding an annual product of \$19,888. The commerce of the state is carried on principally from three ports of entry, Charleston, Georgetown, and Beaufort, the tonnage of these ports being about 12,000, 3,500, and 2,000. Foreign commerce centers mainly at

Charleston. Rice, cotton, phosphate and phosphatic rock, lumber, naval stores, cottonseed and its oil, fish, and spring vegetables are the principal articles shipped. In 1875 there were 1481 m. of railroad in operation in the state. The principal lines are the Charlotte, Columbia and Augusta, 195 m.; Greenville and Columbia, 197 m.; North-eastern railroad, 102 m.; Savannah and Charleston, 104 m.; South Carolina and branches, 242 m.; Spartanburg and Union, 68 m.; Cheraw and Darlington, Atlanta and Richmond air line, Port Royal road, Blue Ridge road, and Wilmington and Columbia. The national banks in 1875 numbered 12, with an aggregate capital of \$3,170,000. There were also at that time 5 state banks, having \$1,800,000 capital, and 3 savings banks with capital and deposits amounting to \$600,000. The only insurance company was the Home insurance co. of Charleston.

The financial condition of the state since the war has been the source of much dissatisfaction. In 1874 the state debt was reported to be \$17,017,651. After much legislation, however, by which much of it was thrown out as null and void, the debt, as reported in 1878, amounted to \$6,537,659; and in 1879 the state finances appeared to be in a satisfactory condition and the administration of the government to be commendably economical. The aggregate expenditures for the legislative, executive, and judicial departments amounted to \$124,895. A general state tax of $4\frac{1}{4}$ mills on the dollar, with 2 mills additional for the public schools, and a county tax of 3 mills for ordinary purposes, was proposed for the following year, which would yield about \$100,000 each mill, or in all \$475,000. Of this amount \$341,372 was appropriated to pay the interest on the consolidated debt, and \$34,000 to pay the deficiency bonds of the state. The remainder of the state tax, together with a royalty to be collected on phosphates, were considered sufficient to cover all the ordinary expenditures for the new year.

In the matter of educational advantages the state has made progress. By the constitution of 1868, provision was made for the compulsory attendance upon public or private schools of all children between the ages of 6 and 16 years. The public schools are presided over by commissioners for the state and for each county, and there are boards of county examiners and district trustees. In 1875 the school population was 239,264, of whom 85,566 were whites and 153,698 colored. The school attendance was 47,000 whites and 63,415 colored. There were 423 school districts, 2,580 free common schools, and 2,855 teachers. About 800 of the schools were of the first grade, 1049 second grade, and 940 third grade. Of the 2,347 school-houses, 1347 were built of logs, 918 were frame, 18 brick, and 1 stone. The total amount of school revenue for the year amounted to \$489,542, of which \$210,000 was appropriated by the state. The colleges, academies, and seminaries in the state are numerous, among which may be mentioned a state normal school at Columbia; the Claflin university (Methodist Episcopal) at Orangeburg; Charleston college; Furman university (Baptist) at Greenville; Newberry college (Lutheran) at Walhalla; Wofford college (M. E. South) at Spartanburg; the Southern Baptist theological seminary (Baptist) at Greenville; and the South Carolina medical college at Charleston. The total number of libraries in 1870 was 1663, which contained 546,244 volumes. Of these, 923 with 397,020 volumes were private, and 741 with 149,224 volumes other than private. The newspapers and periodicals published in the state are about 84, of which 7 are daily, 62 weekly, 4 monthly, and 2 quarterly. The total number of religious organizations in 1870 was 1457, with 1308 edifices and property valued at \$3,276,982. Of these, 523 were Baptist; 611 Methodist; 164 Presbyterian; 83 Episcopal; 49 Lutheran; 12 Roman Catholic; 3 Universalist; 3 Jewish; 1 Congregational; and 1 Unitarian.

The constitution gives the right of suffrage to every male citizen 21 years old who has resided in the state one year and in the county where he shall offer to vote 60 days preceding the election. Elections are by ballot, and a plurality only of the votes cast is necessary for a choice. The legislature is composed of a senate and house of representatives, the two constituting the general assembly of the state of South Carolina. The senate has 33 members and the house 124. The executive power is vested in a governor and a lieutenant-governor, who hold office two years, and a comptroller-general, secretary of state, treasurer, and an attorney-general, who hold office four years. The judicial power is vested in a supreme court, circuit courts, probate courts, and courts of justices of the peace. By the apportionment of 1872 the state has 5 members of congress. The electoral votes have been cast as follows: 1788, Washington, 7, vice-president divided; 1792, Washington, 8, vice-president divided; 1796, Jefferson and Pinckney, 8; 1800, Jefferson and Burr, 8; 1804, Jefferson and Clinton, 10; 1808, Madison and Clinton, 10; 1812, Madison and Gerry, 11; 1816, Monroe and Tompkins, 11; 1820, Monroe and Tompkins, 11; 1824, Jackson and Calhoun, 11; 1828, Jackson and Calhoun, 11; 1832, Floyd and Lee, 11; 1836, Mangum and Tyler, 11; 1840, Van Buren and Tazewell, 11; 1844, Polk and Dallas, 9; 1848, Cass and Butler, 9; 1852, Pierce and King, 8; 1856, Buchanan and Breckenridge, 8; 1860, Breckenridge and Lane, 8; 1868, Grant and Colfax, 6; 1872, Grant and Wilson, 7; 1876, Hayes and Wheeler, 7; 1880, Hancock and English, 7.

SOUTHCOTT, JOANNA, a curious specimen of the religious visionary, was b. in Devonshire, England, of humble parentage, about 1750. In her youth she was a domestic servant, chiefly in Exeter; joined the Methodists, and becoming acquainted with a man

named Sanderson, who laid claim to the spirit of prophecy, made similar pretensions herself. She received encouragement from some weak-minded clergymen of the church of England. In 1792, she declared herself to be the woman driven into the wilderness, the subject of the prophecy in Rev. xii. She gave forth predictions in prose and verse, and although very illiterate, wrote numerous letters and pamphlets, which, as well as her prophecies in verse, or rather in doggerel, were published, and found many purchasers, and many received her pretensions as genuine. One of her productions was the *Book of Wonders*. She also issued sealed papers to her followers, which she termed her *seals*, and which, she assured them, would protect them from the judgments of God both in this and the other world, assuring their salvation. Thousands of both sexes received them with implicit confidence, among whom were men of good education and respectable position in society. At length she imagined herself to have symptoms of pregnancy, and announced that she was to give birth, at midnight on Oct. 9, 1814, to a second Shiloh, or prince of peace, miraculously conceived, she being then more than 60 years of age. The infatuation of her followers was such that they received this announcement with devout reverence, prepared an expensive cradle, and spent considerable sums, that all might be suitable for so great an occasion. The expected birth did not take place, but on Dec. 27, 1814, the woman died. On a post-mortem examination, it was found that the appearance of pregnancy which had deceived others, and perhaps herself, was due to dropsy. She was privately buried in London. Her followers, however, were not to be undeceived, and continued to believe that she would rise again from her "trance," and appear as the mother of the promised Shiloh. In 1851, according to the census returns, there were still four congregations of Southcottians in England. Unfortunately, later census returns afford us no information on such subjects. Some passages in her absurd prophecies are of rather a practical character, as the following: "I am the Lord thy God and Master: Tell I—— to pay thee five pounds for expenses of thy coming up to London; and he must give thee twenty pounds to relieve the perplexity of thy handmaid and thee, that your thoughts may be free to serve me the Lord, in the care of my Shiloh." This was published in 1820. The Lord is also made to inform his people somewhere, anxious to go to meet the Shiloh at Manchester, that traveling by the new cut is not expensive.

The history of Joanna Southcott herself has not much in it that is marvelous; but the influence which she exercised over others may well be deemed so, and the infatuation of her followers is hard to be understood, particularly when it is considered that some of them were men of some intelligence and of cultivated mind. Probably the secret of her influence lay in the fact that the poor creature was in earnest about her own delusions. So few people in the world are really so, that they are always liable to be enslaved by others who have convictions of any kind, however grotesque. On her deathbed, Joanna said: "If I have been misled, it has been by some spirit, good or evil." She knew that she was not "herself" (as the Scotch say), when she prophesied; but she was of too mean an order of intelligence to understand that she was mad, and therefore preferred to attribute her delusions to the deity, or, as she said at the last moment with pathetic half-penitent vacillation, to "some spirit, good or evil." Poor Joanna never suspected that the spirit which played such vagaries was her own.

SOUTHERN, THOMAS, 1660-1746; b. Ireland; educated at Trinity college, Dublin; entered at the Middle Temple, but abandoned law for dramatic literature, and became a popular writer of plays. His principal tragedies were the *Persian Princess*; *Isabella, or the Fatal Marriage*; *Oroonoko*; and comedies, *The Disappointment*; *The Rambling Lady*; *The Wives' Excuse*. He is said to have been the first English writer who denounced the slave-trade in *Oroonoko*. A collection of his plays with a memoir was published in 1774 in 3 vols.

SOUTHERNWOOD. See ARTEMISIA.

SOUTHEY, ROBERT, was b. Aug. 13, 1774, at Bristol, in which city his father was a linen-draper. In 1788 he was sent to Westminster school by his maternal uncle, the rev. Herbert Hill, chaplain to the English factory at Lisbon, who undertook the charge of his education, his father's pecuniary affairs having become much embarrassed. At Westminster, he much distinguished himself; but in 1792 a trivial insubordination led to his expulsion; and next year he was entered at Balliol college, Oxford, with a view to his taking orders. This, however, he ultimately declined to do, having been led by his sympathy with the French revolution, into a considerable departure from the orthodox civil and religious standards. In 1794, he left Oxford, having published the year before, in conjunction with his friend Robert Lovell, a small volume of poems, the first literary venture of a life thenceforward to be almost wholly devoted to literature. Shortly after, he received from Cottle, for his first poem of any length, *Joan of Arc*, the sum of £50; and in Nov., 1795, he was married to a Miss Fricker of Bristol; Coleridge, with whom he had become intimate, on the same day marrying a sister. After passing some little time with this uncle in Portugal, engaged in a diligent study of the language and literature of that country and of Spain, he became a student of law at Gray's Inn. Here he worked at his new poem of *Madoc*, and learned nothing whatever of law, a pursuit which he speedily relinquished as hopeless. In 1801 he accepted a situation as secretary to Mr. Corry, chancellor of the exchequer for Ireland; but finding

its duties distasteful to him, he very soon threw it up, and finally betook himself to literature as his sole source of livelihood.

In 1804 he settled himself at Greta hall, near Keswick in Cumberland, where he spent the remainder of his life, working with the regularity of a machine, happy in his family relations and his unremitting daily round of congenial, though continuous toil. His biography thence onward for 40 years, till the pen dropped from his fingers, might be summarized in the list of his works, which of itself would fill a page or two. In addition to these formal publications, he wrote largely for various periodicals, notably for the *Quarterly Review*, to which, from its establishment in 1809—having now become as violently conservative in his views as in youth he had been revolutionary—he was a most constant and valued contributor.

In 1807, in consideration of his services to literature, a pension of £160 per annum was awarded him; and in 1813, on the death of Mr. Pye, he succeeded him as poet laureate. Through sir Robert Peel, in 1835, he received a further pension of £300, and along with it the offer of a baronetcy, which, however, he decided to decline. His first wife dying in 1837, he, two years after, was married to Miss Caroline Bowles. On March 21, 1843, he died, his few last years having for the most part been passed in a state of painful mental stupor, which incapacitated him for literary exertion.

Southey's poetry—except in a few of his shorter ballad pieces—can at no time be said to have been popular, and is now nearly forgotten. His chief works are *Madoc*, *Thalaba*, *The Curse of Kehama*, and *Don Roderick*, of which the last two are reckoned the best. In all of them are to be found noble passages, in which an ample and stately rhetoric counterfeits with surprising success the pure instinct of music; but they rather skillfully illustrate the art and technic of poetry than breathe its essential life. As a prose writer he ranks high; his style is easy, lucid, agreeable, nicely modulated throughout, and readily rising into eloquence on suggestions of sentiment and subject. But of all his multifarious writings in this kind, his little *Life of Nelson* seems most likely to survive as a classic. The most popular of his works when produced, it continues to be admired as, within the assigned limits, an almost perfect model of biography. Other very excellent biographies, however, are those of the poet Cowper, of Bunyan, and Wesley. His life and correspondence, edited by his son, was published in 6 vols. (1840); and a selection from his letters, edited by his son-in-law, in 4 vols. (1856).

SOUTH FRAMINGHAM, a t. in Middlesex co., Mass., the terminus of the Milford branch of the Boston and Albany railroad, and the southern terminus of the Framingham and Lowell divisions of the Boston, Clinton and Fitchburg, and on the Framingham and Mansfield railroad; 21 m. w. of Boston, 21 m. e. of Worcester; pop. '80, 6,235. It has important manufactories of straw goods, wheels, shoes, and rubber goods.

SOUTHGATE, HORATIO, D.D., b. Me; graduated at Bowdoin college in 1832, and Andover theological seminary in 1835; ordained in the Protestant Episcopal church in 1836; bishop of Constantinople, 1844-50; resigned, and was elected bishop of California in 1850, but declined; rector of St. Mark's church, Portland, Me., 1851-52, and of the church of the Advent in Boston, 1852-58. He published *Tour in Armenia, Kurdistan, etc.*, 2 vols.; *Practical Directions for Lent*; *Visit to the Syrian Church of Mesopotamia*; *The War in the East*; *Pastoral Sermons*; and articles for religious and literary periodicals.

SOUTH ISLAND, the southern of the two large islands which, with the small Stewart's island, form the British colony of New Zealand (q.v.).

SOUTHMOLTON, a municipal borough in the n. of Devonshire, 11 m. e.s.e. of Barnstaple. Woolen goods are manufactured. Pop. '61, 2,830; '71, 3,978.

SOUTH NORWALK, a city in Fairfield co., Conn., near Long Island sound, 42 m. from New York on the New York, New Haven and Hartford, and at the southern terminus of the Danbury and Norwalk, railroad; pop. '80, 5,300. It has a fire department, gas and water works, street railroads, and an opera house. Steamboats run between here and New York for passengers during the summer, and for freight the year round. A hill in the w. part of the city affords a fine view of the sound and Norwalk harbor, and is a desirable point for residences. It contains manufactories of felt hats, bronzed goods, shoes, locks, paper boxes, force pumps, steam-engines, and portable gas machines; there are large iron-works, and considerable ship-building is done. The oyster trade is large.

SOUTHPORT, a fashionable bathing-place in Lancashire on the s. shore of the estuary of the Ribble, 19 m. n. of Liverpool. It is a handsome town, and is almost wholly of recent erection. There are assembly-rooms, libraries, large hotels, etc.; the sands are good, and there is an iron pier nearly a mile long. The rapidity with which Southport has risen in public favor as a watering-place is the best evidence of its salubrity and beauty. Pop. '51, 5,391; '61, 11,303; '71, 18,086.

SOUTH SEA SCHEME. THE, commonly designated the SOUTH SEA BUBBLE, a term peculiarly expressive of its hollow and ephemeral splendor and sudden collapse, was originated by Harley (q.v.), earl of Oxford, in 1711, with the view of restoring public credit, and providing for the extinction of the floating national debt, which at that time

amounted to £10,000,000. This debt was taken up by a number of eminent merchants, to whom the government agreed to guarantee for a certain period the annual payment of £600,000 (being 6 per cent interest), a sum which was to be obtained by rendering permanent a number of import duties. The monopoly of the trade to the South seas was also secured to these merchants, who were accordingly incorporated as the "South Sea company," and at once rose to a high position in the mercantile world. The wondrously extravagant ideas then generally current respecting the riches of the South American continent were carefully fostered and encouraged by the company, who also took care to spread the belief that Spain was prepared, on certain liberal conditions, to admit them to a considerable share of its South American trade; and, as a necessary consequence, a general avidity to partake in the profits of this most lucrative speculation sprung up in the public mind. It may be well to remark in this place that the company's trading projects had no other result than a single voyage of one ship in 1717, and that its prominence in British history is due entirely to its existence as a purely monetary corporation. Notwithstanding the absence of any symptoms of the carrying out of its great trading scheme, the company had obtained a firm hold on popular favor, and its shares rose day by day; and even when the outbreak of war with Spain in 1718 deprived the most sanguine of the slightest hope of sharing in the treasures of the South seas, the company continued to flourish. Far from being alarmed at the expected and impending failure of a similar project—the Mississippi scheme (q.v.)—the South Sea company believed sincerely in the feasibility of Law's scheme, and resolved to avoid what they considered as his errors. Trusting to the possibility of pushing credit to its utmost extent without danger, they proposed, in the spring of 1720, to take upon themselves the whole national debt (at that time £30,981,712), on being guaranteed 5 per cent per annum for 7½ years, at the end of which time the debt might be redeemed if the government chose, and the interest reduced to 4 per cent. The directors of the bank of England, jealous of the prospective benefit and influence which would thus accrue to the South Sea company, submitted to government a counter-proposal; but the more dazzling nature of their rival's offer secured its acceptance by parliament—in the commons by 172 to 53, and (April 7) in the lords by 83 to 17; sir Robert Walpole in the former, and lords North and Grey, the duke of Wharton, and earl Cowper in the latter, in vain protesting against it as involving inevitable ruin. During the passing of their bill the company's stock rose steadily to 330 on April 7, falling to 290 on the following day. Up till this date the scheme had been honestly promoted; but now, seeing before them the prospect of speedily amassing abundant wealth, the directors threw aside all scruples, and made use of every effective means at their command, honest or dishonest, for keeping up the fictitious value of the stock. Their zealous endeavors were crowned with success; the shares were quoted at 550 on May 28, and 890 on June 1. A general impression having by this time gained ground that the stock had reached its maximum, so many holders rushed to realize that the price fell to 640 on June 3. As this decline did not suit the personal interests of the directors, they sent agents to buy up eagerly; and on the evening of June 3 750 was the quoted price. This and similar artifices were employed as required, and had the effect of ultimately raising the shares to 1400 in the beginning of August, when the chairman of the company and some of the principal directors sold out. On this becoming known, a wide-spread uneasiness seized the holders of stock, every one was eager to part with his shares, and on Sept. 12 they fell to 400, in spite of all the attempts of the directors to bolster up the company's credit. The consternation of those who had been either unwilling or unable to part with their scrip, was now extreme; many capitalists absconded, either to avoid ruinous bankruptcy, or to secure their ill-gotten gains, and the government became seriously alarmed at the excited state of public feeling. Attempts were made to prevail on the bank to come to the rescue, by circulating some millions of company's bonds; but as the shares still declined, and the company's chief cashiers, the Sword-blade company, now stopped payment, the bank refused to entertain the proposal. The country was now wound up to a most alarming pitch of excitement; the punishment of the fraudulent directors was clamorously demanded; and parliament was hastily summoned (Dec. 8) to deliberate on the best means of mitigating this great calamity. Both houses, however, proved to be in as impetuous a mood as the public; and in spite of the moderate counsels of Walpole, it was resolved (Dec. 9) to punish the authors of the national distresses, though hitherto no fraudulent acts had been proved against them. An examination of the proceedings of the company was at once commenced; and on Walpole's proposal nine millions of South Sea bonds were taken up by the bank, and a similar amount by the East India company. The officials of the company were forbidden to leave the kingdom for twelve months, or to dispose of any of their property or effects. Ultimately, various schemes, involving the deepest fraud and villainy, were discovered to have been secretly concocted and carried out by the directors; and it was proved that the earl of Sunderland, the duchess of Kendal, the countess Platen and her two nieces, Mr. Craggs, M.P., the company's secretary, Mr. Charles Stanhope, a secretary of the treasury, and the Sword-blade company, had been bribed to promote the company's bill in parliament by a present of £170,000 of South Sea stock. The total amount of fictitious stock created for this and similar purposes was £1,260,000, nearly one-half of which had been disposed of. Equally flagrant iniquity in the allocation of shares was discovered, in which, among

others, Mr. Aislable, the chancellor of the exchequer, was implicated. Of these offenders, Mr. Stanhope and the earl of Sunderland were acquitted, through the unworthy partiality of the parliament; but Mr. Aislable and the other directors who were members of the house of commons, were expelled; most of the directors were imprisoned, and all of them suffered confiscation of their possessions. The chairman was allowed to retain only £5,000 out of £183,000, and others in proportion to their share in the fraudulent transactions of the company. At the end of 1720, it being found that £13,300,000 of real stock belonged to the company, £8,000,000 of this was taken, and divided among the losers, giving them a dividend of 33½ per cent; and by other schemes of adjustment, the pressure of loss was so fairly and widely distributed, that the excitement gradually subsided. Contemporary with this great gambling scheme were numerous other "bubbles," most of them based upon the most shadowy foundations, and projected for the achievement of the most frivolous and even absurd ends; but none of them rose to such importance as the South Sea scheme, though collectively they added greatly to the general distress of the period, till they were suppressed by act of parliament, July 12, 1720.—See Cox's *Walpole*, *Bubblers' Medley*, published by Carlington Bowles, Mackay's *Popular Delusions*, and the various histories of England during this period.

SOUTH SHETLAND, or **NEW SOUTH SHETLAND**, a group of islands, and a tract of what is supposed to be main-land in the South Atlantic, about 600 m. s. of cape Horn, in lat. 60° 32' to 67° 15' south. Of the islands, which are destitute of vegetation, with the exception of a species of moss, the chief are Livingston, Cornwallis, King George, Clarence, and Elephant islands. The most recent explorers in this region are Liscoe in 1832, and Sir J. Ross in 1842.

SOUTHWARK. See LONDON.

SOUTHWELL, a small market t. of considerable antiquity in Notts, 12 m. n.e. of Nottingham. At Southwell Charles I. surrendered himself to the Scotch commissioners. Pop. '71, 2,400.

SOUTHWELL, ROBERT, 1560-95; b. England; educated on the continent; became prefect of the Jesuits' college at Rome in 1585; was sent in 1586 as a missionary to England; apprehended in 1592 on a charge of conspiracy against the government of queen Elizabeth; imprisoned in the Tower for three years, and though put to the torture ten times, confessed only that he came to England for the purpose of making converts to the Roman Catholic faith; was tried in court of king's bench, found guilty, and hanged at Tyburn in 1595, though there seems to have been scant proof of his crime. His important poems are contained in *St. Peter's Complaint and other Poems*, with a sketch of his life. His chief prose works are *Triumph over Death*; *Epistle of Comfort*; *Mary Magdalen's Funeral Tears*. Complete editions of his works have been published.

SOUTHWORTH, CONSTANT, 1614-85; b. Leyden, Holland; came to New England in 1621 with his mother; was one of the colonists of Duxbury; often a member of the legislature; assistant-governor of Plymouth, and governor of the Kennebec plantation.

SOUTHWORTH, EMMA D. E. (NEVITT), b. Washington, D. C., in 1818; commenced writing tales and sketches for the *National Era*, Washington. She has published *Retribution*; *The Deserted Wife*; *Shannondale*; *The Curse of Coston*; *The Lost Heiress*; *The Discarded Daughter*; *Cruel as the Grave*; *Tried for her Life*; *A Beautiful Friend*; and many others. Her novels show strong dramatic power, are high in color, and have been popular. She has been a frequent contributor to the *New York Ledger*. Her complete works were published in Philadelphia in 35 vols.

SOUTHWORTH, NATHANIEL, 1806-58; b. Mass.; began the study of drawing in Boston and became a miniature painter of high rank in the profession. He went to Europe in 1848, and on his return resided in New York and Philadelphia.

SOUVALKY, chief t. of the government of the same name, in Poland, is situated on the left bank of the river Charnagarche, a tributary of the Niemen, 538 m. s.w. of St. Petersburg. Pop. '67, 16,896.

SOUVESTRE, ÉMILE, 1806-54; b. France. In 1820 he engaged himself as a publisher's clerk at Nantes; afterward earned his living as a journalist and literature, and in 1836 settled in Paris. After the revolution of 1848 he delivered popular lectures in the new school of administrative science, and later in Switzerland, which were published as *Causeries Historiques et Littéraires* in 1854. He wrote many didactic novels and tales, and his *Philosophie sous les toits* received an academical prize in 1851. Among his numerous novels are *Les Derniers Bretons*; *L'Homme et l'Argent*; *Confessions d'un Ouvrier*; and *Pierre et Jean*.

SOUZDAL', a t. of European Russia, in the government of Vladimir, noted as being one of the oldest towns in Russia, having, according to certain accounts, been founded 606 B.C. Pop. '67, 6,861.

SOVEREIGN, the name applied in politics to the person or body of persons in whom the legislative power of a state is vested. In limited monarchies, sovereignty is in a qualified sense ascribed to the king, who, though the supreme magistrate, is not the sole legislator. A state in which the legislative authority is not trammelled by any foreign

power is called a sovereign state. The states of the German empire were designated *mi-souveraines*, because their sovereignty was qualified by their subordination to the imperial authority; and the same term may be applied to the states of the American union.

SOVEREIGN, an English gold coin of the value of twenty shillings sterling, the standard weight of which is 123.374 grains troy. The name was first applied to a gold coin issued in the reign of Henry VIII., otherwise called the double royal or rial, on which the king was represented in the royal robes. The name disappeared after a few reigns, and was revived as applicable to the gold piece of George III., issued in 1817, of the value of twenty shillings, which was substituted for the guinea, which had previously been current, of the value of twenty-one shillings.

SOWBREAD. See CYCLAMEN.

SOWER, CHRISTOPHER, b. Germany, 1758; a printer; came to this country and published, 1739, the first quarterly in a foreign language ever issued in Pennsylvania. He was the first to manufacture type and printer's ink in this country, and printed a quarto Bible in German in 1743. His son CHRISTOPHER, 1721-84, who emigrated with him, succeeded his father in the book-making business, and invented cast-iron stoves. During the revolution he was called *Das Brod-Vater*, the bread-father, on account of his liberal distribution of provisions to the destitute, but, joining the loyalists, his estates were confiscated.

SOWERBY, GEORGE BETTINGHAM, 1788-1854; b. Lambeth, England; second son of James Sowerby, published *The Genera of Recent and Fossil Shells*, 1822-34, with 264 colored plates, illustrated by his father and brother. He also published a *Catalogue of the Shells contained in the Collection of the late Earl of Tankerville*, which he purchased for £6,000. He was one of the founders of the *Zoological Journal*, 1825-35, and contributed over 40 papers to its columns. He was a writer for numerous scientific publications.

SOWERBY, GEORGE BRETHINGHAM, b. England, 1812; has published a number of books on conchology and kindred subjects, illustrated by himself, of which *Thesaurus Conchyliorum* is the most extensive.

SOWERBY, JAMES, 1757-1822; b. England; began life as a teacher of drawing and painter of miniature portraits; became a botanist and mineralogist of distinction, and published seven works on those sciences, illustrated by himself; among them *English Botany, or, Colored Figures of all the Plants Native of Great Britain*, and *British Mineralogy*.

SOWERBY BRIDGE, a small manufacturing t. in the West Riding of Yorkshire, 3 m. s.w. of Halifax. It contains iron-works, malting-houses, corn-mills, worsted and cotton factories, chemical works, and dye-works; but the woolen manufacture is the principal branch of industry. Pop. '61, 5,382; '71, 7 041.

SOWING and SOWING-MACHINES. Sowing is the deposition in the ground of the seeds of cultivated plants, and while agriculture was yet in a rude condition, was always performed by scattering the seeds from the hand over the prepared surface of the soil. This mode, distinguished as *hand-sowing*, is still employed in the Highlands and in garden husbandry; but in the more extensive operations of the farm, it has been very much superseded by the use of sowing-machines of various kinds—the broadcast sowing-machine, the drilling-machine, and the dibbling-machine; the first being employed exclusively for cereals and grasses, the other two for any kind of crop. The preparation of the soil for the reception of the seed consists in the thorough removal from it, or destruction, of weeds; in its reduction to as fine a state of division as possible by means of the plow, grubber, harrow, and roller, and in the application of the fitting manures. Attention must also be paid to the seed to be sown, that it be mature, unmixed, and each seed perfect in itself. A frequent change of seed from different soils and climates is beneficial. Strong, vigorous seed should be used. Imperfection of seed can be remedied by "steeping" the seed previous to sowing it. The "steeps" employed are of two sorts, acid and alkaline; the former acting directly on the fungoid sporules and the bruised grains, and destroying their vitality; the latter converting the cily matter which attaches the sporules to the grains into soap, and so detaching them by the aid of a little stirring. Of the acid steeps, blue vitriol or sulphate of copper ($\text{SO}_4, \text{CuO} + 5\text{H}_2\text{O}$) in the proportion $\frac{1}{2}$ lb. to 1 lb. to as much water as will cover 4 bushels of grain, is the best of all steeps, and is the one most commonly employed; the others are green vitriol or sulphate of iron ($\text{SO}_4, \text{FeO} + 7\text{H}_2\text{O}$), and various arsenical preparations. The alkaline steeps, which are inferior to the former, being more limited and less certain in their action, are putrid urine, lime-water of maximum strength, and Glauber's salts or sulphate of soda. After the seed has been steeped, it ought to be spread out on a floor in thin layers to dry, after which it should be at once sown.

Cereals.—As above mentioned, cereals may be sown either broadcast, drilled, or dibbled. If the first method is to be adopted, the land receives what is called the seed-furrow; or if rough, it gets a single stripe with the harrows, and the seed is then sown either by hand or by the broadcast machine. This machine consists of a triangular frame with the apex to the front, supported on three wheels, and carrying a long wooden box of the form of a triangular prism, set with a flat side—the lid—uppermost. This box, which is placed at right angles to the line of draft, is furnished with a row of

small holes at the bottom, about 7 in. apart; and a little above this row is placed a longitudinal spindle, carrying a set of hard circular brushes, one opposite each hole, and deriving a rotatory motion from the axle of the hind wheels. The size of the apertures can be adjusted to the desired quantity of seed per acre, by means of a movable plate outside provided with holes corresponding to those of the box. When the box is supplied with seed, and the machine set in motion, the grain drops through the holes, which are kept from clogging by the rapid rotation of the brushes. The box is made of such a length (16 to 20 ft.) that 30 to 35 acres may be sown in a day. The seed is then covered by harrowing. This machine was much used in Scotland, being rather better suited to hilly and uneven surfaces, and, from its more rapid execution, to a climate which more frequently interferes with agricultural operations. In England, where the climate is more favorable, and the surface more level, the drilling-machine is the favorite. So it is now in Scotland, where the amount of seed deposited by drilling has increased immensely during the last 10 years. Even in the far inland glens, drill-machines are rather growing in popularity. The land is prepared for sowing by as complete pulverization as possible, and its surface is made quite even by the harrow and roller. The drill which, in the arrangement of some of its essential parts, corresponds to the broadcast-machine, differs from it in being furnished with a set of coulters, which are hollowed behind to inclose the lower ends of a corresponding set of tin tubes, whose upper ends are fixed opposite to the holes in the seed-box. By this machine a series of furrows of uniform depth are made by the coulters; into these furrows the seed is conveyed by means of the tin tubes. The modern drill-machine covers the seed most uniformly. The harrowing is generally completed before drilling begins. The spindle inside the seed-box is provided with grooved cylinders or pinions in place of brushes, and the seed rows are generally made from 4 to 10 in. apart. The advantages of this machine over the former consist in the greater regularity of deposition of the seed, which admits of hoeing and other clearing operations during the early period of growth; in the uniform depth at which the seed is planted, so that none of it is lost by being buried, while it is all covered; in the protection of the operation from the disturbing influence of winds; in the saving of seed and greater yield of grain, it being often found that if drilled seed be to broadcast, in quantity, as 2 to 3, their respective yields are nearly as 5 to 4; in the free access of sun and air during growth; and in the less liability of the crop to "lodge" flat at the root. But it has one disadvantage; an ordinary drill cannot sow more than 10 to 12 acres per day, and employs more men and horses than the broadcast-machine. From 2 to 3 bushels of seed per acre suffices with the drill, whereas from 3 to 4 is necessary with the broadcast machine, and from 5 to 6 bushels with the hand. The great saving of seed and other advantages thus fully atone for the extra work involved by the drill.

The third method of sowing, by dibbling, is employed chiefly on the light soils in the s. of England, and even there not generally, at least in the case of cereals, so that a minute description of the machines by which the operation is effected is unnecessary. Suffice it to mention that dibbling only requires about one third of the seed which is necessary in drilling, and presents still greater opportunities for weeding and stirring the soil in the early stages of growth; but is attended with various important defects, and is more expensive.

When a cereal crop is to be followed by grass, the grass seeds are sown a few days after the other crop, by a broad-cast machine or by the hand.

Beans.—The sowing of this crop (see BEAN) is performed by means of the *bean-barrow*, a machine the same in structure as the drilling-machine for corn, but wanting the coulters, and having only three tubes, through which the seeds fall. Peas are frequently sown along with beans, the latter acting as a support to the former, and the two together better preventing the growth of weeds. The hand is also sometimes adopted.

Turnips.—For this crop the ground must be more thoroughly cleaned and broken down than for any other; after which it is formed into drills from 26 to 29 in. apart, which are then supplied with manure, and covered with the drill-plough, splitting the original drills. The new ridges thus formed being directly above the manure, the seeds are sown on the top of each ridge by the means of the *turnip-drill*. This machine, instead of a seed-box of the ordinary form, has two tin or tinned-iron barrels, placed on a spindle. Each cylinder has a row of holes round its middle circumference, the row being covered by a circular sliding collar of thin metal, perforated with corresponding holes. Each seed-box has its corresponding seed-tube and hollow coulter, as in the corn-drill; but the turnip-machine has in addition a roller in front of the coulters, for compressing the crests of the ridges, and some machines have two light rollers attached behind, which slightly compress the earth raised by the coulters, and cover the seeds. The quantity of seed sown is about 2 lbs. of globe or yellow, and about 3 lbs. of Swedish turnips to the acre. The proper time to sow swedes is from the 12th to 25th of May, and yellows from May 26 to June 12.

SOW THISTLE. *Sonchus*, a genus of plants of the natural order *compositæ*, suborder *cichoraceæ*, having on imbricated involucre, swollen at the base, with two rows of unequal scales, which at length bend inward; a naked receptacle; the fruit transversely wrinkled and without a beak, the pappus hairy and without a stalk. The COMMON SOW

THISTLE (*S. oleraceus*) abounds in Britain and in most parts of Europe, as a weed in gardens and cultivated fields. It is an annual plant, delighting in rich soils, grows to the height of two or three ft., with somewhat branching stem, and small yellow flowers almost in umbels. The tender tops and leaves are much used in the north of Europe as greens.—The **CORN SOW THISTLE** (*S. arvensis*) is a perennial with large yellow flowers, frequent in corn fields in Britain, and throughout great part of Europe.—Nearly allied to the genus *Conchus* is *Mulgedium*, to which belongs the **ALPINE BLUE SOW THISTLE** (*M. alpinum*), the beautiful blue flowers of which adorn some of the most inaccessible spots of the mountains of Switzerland and of Scotland.

SOY is a thick and piquant sauce, made from the seeds of the **SOY BEAN** (*Soy hispida*), a plant of the natural order *leguminosæ*, suborder *papilionaceæ*, so nearly allied to the genus *dolichos* (q. v.) as to be often included in it. It is a native of China, Japan, and the Moluccas, and is much cultivated in China and Japan. It is also common in India, although, probably, not a native of that country. The seeds resemble those of the kidney bean, and are used in the same way. The Japanese prepare from them a substance called *miso*, which they use as butter.

Soy is made by mixing the beans softened by boiling with an equal quantity of wheat or barley roughly ground. The mixture is covered up, and kept for 24 hours in a warm place to ferment. The mass is then put into a pot, and covered with salt, the salt used being in quantity about equal to each of the other ingredients. Water is poured over it; and it is stirred, at least once a day, for two months, after which the liquor is poured off and squeezed from the mass, filtered, and preserved in wooden vessels. By long keeping, it becomes brighter and clearer. A Chinese sauce, called *kitchap* (ketchup), is often sold in Britain as soy, but is very inferior to the true soy.

SPA, a t. of Belgium, and a watering-place of world-wide celebrity, stands in a romantic valley amid hills which form part of the Ardennes chain, 27 m. s.e. of Liège, and 22 m. s.w. of Aix-la-Chapelle by railway. The prettily-built town consists almost entirely of inns and lodging-houses. The chief edifices are the *Redoute*—plain outside, but handsome within, and including under one roof a theater (open four times a week), a ball-room, etc.—and the *Pavillion*, a second Redoute, but now little used. Gaming, which figured prominently among the amusements, was suppressed in 1872. The mineral springs, seven in number, are all chalybeate, and contain minute quantities of iron, so combined with alkaline salts and carbonic acid gas as to be both easily digested and agreeable to the palate. They are cold, bright, and sparkling, and are efficacious in complaints of the liver, nervous diseases, etc. Spa-water is exported to all quarters of the globe. The other springs are near the town, and most of them are situated amid picturesque plantations. Spa is also famed for the manufacture of wooden toys, which are stained brown by being steeped in the mineral waters. Pop. 70, about 5,900. The number of visitors during the season is about 20,000, of whom half are Belgians. Spa was frequented as a watering-place as early as the 14th c., and has given its name to many mineral springs.

SPACCAFORNO, a city of Sicily, in the province of Syracuse, with 8,035 inhabitants. Opposite Spaccaforno, Roger, king of Sicily, gained a signal victory over the Saracens in 1092.

SPACE AND TIME. Space and Time being the most general conditions, forms, or attributes of all existing things, their discussion is linked with the highest problems of philosophy. Space is co-extensive with, and inseparable from, the sensible, external, or object world; time is a property both of the object world and of the subject mind.

Of the so-called innate ideas maintained by one school of philosophy, Space and Time are the foremost examples. (Other examples are number, infinity, being, substance, power, personal identity, etc.) Accordingly, it is held, on the one side, that these notions are underived, or intuitive to the mind; and, on the other side, that they arise in the course of our education or experience, like our ideas of heat, sound, color, gravity, etc.

To begin with space. The supporters of the innate or intuitive origin of the idea allow that it does not arise in the mind until actual objects, or extended things, are presented to the senses—until we see the visible, and touch the tangible things around us: but they declare that this contact with the sensible world is only the *occasion* of our becoming conscious of what was already in the mind. Thus, Mr. Mansel says: "Space is not properly an *innate idea*, for no idea is wholly innate; but it is the innate element of the ideas of sense which experience calls into consciousness." It is, in short, the superadding of some independent activity of the mind to the passive sensation. The reasons usually given for assuming an intuitive element in the idea of space are, in the main, the reasons given for innate ideas generally; they chiefly resolve themselves into affirming the attributes of *universality* and *necessity* in such ideas; and the inadequacy of mere sensible experience to reveal these high attributes of things. Whatever is got by experience can be thought away; space and time cannot. Thus, it is impossible for us to receive any sensible impression of an outward object—the sun, for example—without conceiving

that thing as existing in space. To use the language of Kant, space is a form of our sensibility, or sensible perception; and as the perception itself cannot, he thinks, give this universal and inseparable form—it must be contributed by the mind. Sir W. Hamilton supposes that we may have an “empirical” notion of space—i.e., a notion from experience; but that space as a “form” is not obtained from experience, but from intuition. He does not, however, explain clearly wherein consists the difference between these two notions.

According to the opposite view space is an abstraction from our experience of extended things, exactly as gravity is an abstraction from gravitating bodies, and justice from just actions. We first obtain from experience a variety of impressions, in the concrete, of things possessing extension; and, next, from all these, by the usual process of abstraction, we gain a notion of extension in the abstract, or space. A few remarks may be made on these two distinct operations, as both involve matters of controversy.

1. Before the muscular feelings were distinctly recognized as something superadded to the proper sensations of the senses—or the feelings of mere light, sound, etc., it was not easy to show that, by sensible experience alone, we could perceive objects as extended, or as occupying space. The pure optical sensibility of the eye is for color solely; the pure tactile sensibility is for softness and smartness, roughness and smoothness, etc. When, however, we make full allowance for the whole range of feeling connected with the exercise of muscular energy, there is no difficulty in accounting for the origin of such notions as resistance (force or power) and extended magnitude. The element supposed by the *a priori* philosophers to be contributed by the mind itself, is according to the other school, muscularity, or the feeling of the putting forth of inward energy. The two senses related to our cognizance of space—sight and touch, are compound senses; they involve an active energy, with its peculiar consciousness, as well as a passive sensibility; and all that is characteristic of extension or space arises through these muscular accompaniments.

2. Having perceived a great number of things as extended, with the intervals of unoccupied extension that separate these, we form an idea of extension in the abstract. The distinguishing peculiarity of this abstraction is related to *unoccupied* extension, or empty space, where we seem to have extension without anything extended; rendering the idea of space unlike other abstract ideas, as gravity, or justice, which are conceivable only as embodied in gravitating things, or just actions. Still, empty space is a reality to us, inasmuch as it expresses cessation of resistance, and free scope for movement. To the senses alone, without the muscular accompaniments, space would be a nonentity: an inconceivability; but the feeling of the sweep of the arm, or of the locomotion of the body, in passing from one point of resistance to another is a genuine mental experience—the filling up of the interval between two tactile encounters, or between two optical pictures, with conscious activity.

The idea of TIME, continuance, or endurance, applies both to our feelings of energy put forth, and also to our sensations, emotions, and the flow of our ideas; in other words, it attaches both to the extended or object world, and to the unextended or subject mind. In our muscular feelings, which represent the universe of matter and space, we discriminate a dead strain, or effort of resistance, lasting a short time from the same strain lasting a longer time; and also a more persisting movement from a less. So in the sensations; a sound enduring a second is different to us from a sound enduring two seconds; a transitory odor is not confounded with one of greater continuance. We distinguish two bursts of wonder, terror, love, or anger, if they have been unequal in their duration. Abstracting from all these experiences of continuance in the concrete, we obtain the idea of time; which idea, however, like other abstractions, must be conceived by us under some individual continuing thing. If we were to imagine the whole outward universe annihilated, we should still have, in our own consciousness, an instance of the continuing, and upon that we could sustain the conception of time. See GENERALIZATION.

Time is measured by space, and space by time. The one is often expressed by the other, but with a certain limitation; we say “a space of time,” but not “a time of space.” Movement is common to both. Of passive sensations, the best for indicating time are those of hearing.

SPADE HUSBANDRY, COTTAGE-FARMING, and FIELD-GARDENING, are phrases of synonymous meaning, and denote the cultivation of farm-crops on a small scale by means of the spade. This system has long been in operation in Belgium and Flanders, where the holdings average little more than five, though a few are as large as forty acres; and by steady industry and economy, even the smallest of them is capable of maintaining a family in comfort. In this country, cottage-farming is chiefly practiced among the miners in Cornwall, who at first received leases of their coarse unreclaimed land at 2s. 6d. —5s. per acre, the lease to last for three lives. These patches of from three to five acres number over 6,000, and have increased greatly in value. In Orkney and Shetland, some of Sutherlandshire, and much of the Western isles of Inverness and Argyshire, spade-culture is quite common, and when properly done is a thorough means of cultivation. In Lincolnshire, especially on the isle of Axholme, the same system exists. The suc-

cess of small-farming depends on two causes—the inexpensiveness of the stocking and implements, and the superior fertility of the soil when dug. The implements required are—spades and digging-forks of different sizes, hoes, rakes, scythe, reaping-hooks, flail, hay-fork, wheel-barrow, and a few other implements equally inexpensive; the steading consists of the cottage, a cow-shed (for one or two cows), and a pig-sty; the stock, of cows, pigs, and poultry, besides household furniture. The superiority of the spade over the plow rests on its deeper cultivation; on its not forming a hard impermeable crust on the surface of the subsoil, as the plow does; on its more thorough subdivision of the soil; and on its more effective burying of weeds. Besides the treading of the land by the horses' feet is avoided. As a conclusive instance of this, may be given a sketch of the system pursued by the rev. Mr. Smith of Lois-Weedon, Northamptonshire, with its results. Mr. Smith drilled wheat in the usual manner, dug the intervals two spits deep, so as gradually, year by year, to bring up more and more of the subsoil, and by careful keeping down of weeds, repeated stirring of the soil, and sowing the next crop in the intervals between the rows of the former, he succeeded, at a total expense of £3 14s. per acre, in obtaining a profit of £8 per acre. Mr. Smith also sowed wheat in strips of three rows, with twelve inches between the rows, and intervals of three feet between the strips; and by dint of thorough digging and trenching between the rows with the spade, he succeeded for 14 successive years in producing 36 bushels of wheat annually, without the application of a particle of manure. Similar experiments have been made with success at Rothamstead in Herts, by Mr. Lawes, who found, however, that proper and sufficient manuring almost doubled the crop. The subject of cottage-farming deserves serious attention in connection with the movement for ameliorating the condition, and preventing the decrease, of the rural population of the country. It is receiving such; there is a growing feeling among landlords in favor of increasing the number of crofts, and thereby inducing the best laborers to remain in their native country, instead, as has been too much the case, of emigrating.

SPAGNOLET TO. See RIBERA.

SPAHIS (the same with *Sipahi*, or Sepoy q.v.) were the cavaliers furnished by the holders of military fiefs to the Turkish army, and formed the *élite* of its cavalry. The spahis, along with the Janizaries (q.v.) owe their organization primarily to Orchan, the second of the Ottoman sultans, finally to sultan Amurath I.; and when levied *en masse*, could number 140,000, but such a levy was very seldom called for. In the field, they were divided into two classes, distinguished by the color (red and yellow) of their standards; one class had pistols and carbine, the other a bow and arrows, and both carried a saber, lance, and *jerid*, or javelin. They were excellent irregular troops; but when European organization was introduced into the Turkish army, they were replaced (1826) by regular horse. At the present time, the French have numerous regiments of spahis, raised from among the native tribes of Algeria and from France in about equal proportions; the dress, especially of the indigenous soldiers, partakes very much of the Arab character. The natives are allowed to rise to any grade below that of capt.; but all the superior officers are of French descent. See ZOÜAVES.

SPAIGHT, RICHARD DOBBS, about 1745–1802; b. Ireland; educated at Glasgow university; emigrated to North Carolina shortly before the revolution, and fought on the American side. He was a member of congress, 1782–86, and 1798–1801, and of the constitutional convention of 1787. From 1782 to 1785 he was the governor of North Carolina. Spaight was killed in a duel with one John Stanley.

SPAIN (Span. *España*), a kingdom of Europe, occupying the larger portion of the great peninsula which forms the s.w. corner of the European continent, reaching further s. than any other European country, and further w. than any except Portugal. It is bounded on the n. by the bay of Biscay and by France, from which it is separated by the mountain ridge of the Pyrenees; on the e. and s. by the Mediterranean and Atlantic; and on the w. by the Atlantic and Portugal. Greatest length, from Fuerteventura on the n. to Tarifa on the s. 560 m.; greatest breadth, from cape Finisterre (Land's End), the extreme point on the w., to cape Creuze, the extreme point on the e.; about 650 miles; average breadth about 380 miles. Area, including the Balearic (q.v.) and Canary isles, 196,031 sq.m.; pop. '70, 16,835,506. The country, including the Balearic and Canary isles, was divided in 1834 into 49 modern provinces, though the former division, into 14 kingdoms, states, or provinces, is still sometimes used. The following is a table of the ancient states, and of the modern provinces into which they have been divided, with their areas and populations, according to the most recently published estimates—those of 1870:

Ancient Provinces.	Modern Provinces.	Area in English Square Miles.	Population in 1870.

Coast-line.—The entire perimeter of the country is 2,080 English m., and the coast-line, exclusive of windings, is 1317 m. long, of which 712 m. are formed by the Mediterranean, and 605 m. by the Atlantic. The n. coast, from Fuenterrabia w. to cape Ortegá, is unbroken by any considerable indentation. A wall of rocks, varying in height from 30 to 300 ft., runs along this shore; but the water, which contains considerable depth close to the beach, is not interrupted to any unusual extent by islands or rocks.

The n.w. coast, from cape Ortegal s. to the mouth of the river Minho—which separates the Spanish province of Galicia from Portugal—though rock-bound, is less elevated, and is much more broken than the shores washed by the bay of Biscay; and the indentations, the chief of which are Noya Arosa and Vigo bays, form secure and spacious harbors. From the mouth of the Guadiana, on the s., to the strait of Gibraltar, the coast-line, though well-defined, is low, sandy, and occasionally swampy. From Gibraltar to cape Palos the shores, which are backed in part by the mountain-range of the Sierra Nevada, are rocky and high (though flats occur at intervals), are unbroken by indentations, and comprise only two harbors, those of Cartagena and Malaga. A low, and for the most part sandy, coast extends n. from cape Palos, rising into rocky cliffs and bluffs in the vicinity of Denia, but extending in sandy flats from Denia to the mouth of the Ebro. From the mouth of this river, n. to the frontier of France, the coast is alternately high and low, and its principal harbors are Barcelona and Rosas.

Surface and Hydrography.—The compactness and the isolation of this country, and its position between two seas, the most famous, and commercially the most important in the world, are not more in its favor than the character of its surface, which is more diversified than that of any other country in Europe of equal extent. An immense plateau, the loftiest in the continent, occupies the central regions of Spain, and is bounded on the n. and w. by mountainous tracts, and on the n.e. by the valley of the Ebro; on the e. by tracts of land frequently low, but in some parts traversed by hill-ranges; on the s. by the valley of the Guadalquivir, which intervenes between it and the Sierra Nevada (q.v.). This great plateau rises to the height of from 2,000 to 3,000 ft., and occupies upward of 90,000 sq.m., or about half of the entire area of the country. The whole of the Pyrenean peninsula is divided by Spanish geographers into 7 mountain ranges, of which the chief are: 1. The Cantabrian mountains (q.v.) and the Pyrenees (q.v.), forming the most northern range; 2. The Sierra de Guadarrama, separating Leon and Old Castile from Estremadura and New Castile, and rising in the peak of Penalara 7,764 ft. above sea-level; 3. The Montes de Toledo, forming a part of the watershed between the Tagus and the Guadiana; 4. The Sierra Morena (q.v.), between the upper waters of the Guadiana and Guadalquivir; 5. The Sierra Nevada (q.v.), running parallel with the shores of the Mediterranean, through southern Murcia and Andalusia, and rising in its chief summits to loftier elevations than are found in any mountain-system of Europe, except that of the Alps. The several mountain-ridges, or as they are called, *Cordilleras* of Spain, have a general e. and w. direction, and between them run, in the same direction, the nearly parallel valleys or basins of the great rivers of the country, the Douro, Tagus, Guadiana, and Guadalquivir, each of which is described in its proper place.

Climate and Soil.—The climate of Spain, owing to the extent and configuration of the country, is exceedingly various. In the n.w. (maritime) provinces, it is damp and rainy during the greater part of the year; at Madrid, which is situated about 11° s. of London, and only 5° n. of the shores of Africa, winters have occurred of such severity, that sentinels, while on duty, have been frozen to death; while the s. and e. provinces are warm in winter, and are exposed to burning winds from the s., and to an almost tropical heat in summer. Both ancient and modern geographers have adopted difference of climate as the rule for dividing the peninsula into tracts distinct as well in soil and vegetation as in temperature. Of these tracts or zones the first and most northern may be considered as embracing Galicia, Asturias, the Basque provinces, Navarre, Catalonia, and the northern districts of Old Castile and Aragon. In this tract the winters are long, and the springs and autumns rainy, while n. and n.e. winds blow cold from the snow-covered Pyrenees. The country, which alternates with hill and dale, is plentifully watered by streams rich in fish, and meadows yielding rich pasturage abound. Corn scarcely ripens in the more exposed districts, but grain crops of all kinds are produced in others, as well as cider, wine, and valuable timber. The middle zone is formed mainly by the great central plateau, and embraces northern Valencia, New Castile, Leon, and Estremadura, with the s. parts of Old Castile and Aragon. The climate of the great part of this region is pleasant only in spring and autumn. Throughout the chilly winter, the treeless table-lands are over-swept by violent tempests, and in summer are burned up by the sun. The soil is generally fertile, and corn and wine are most abundantly produced. The southern or Batican zone, comprising the rich country that extends between the southern wall of the central plateau and the Mediterranean shores, includes Andalusia, Murcia, and southern Valencia. The stony rampart on the n. protects it from the chilly winds of the central zone; but it is unprotected against the hot winds (the *Solana*, see *SIMOX*) which in summer blow n. from Africa, and render this season intolerable to northern Europeans. Here the winter is temperate, and the spring and autumn delightful beyond description. The descent from the cold and mountainous central regions to this tract of tropical heat and fertility affords a most striking contrast. The soil, which is artificially irrigated, is well adapted to agriculture and the cultivation of heat-loving fruits. The products comprise sugar, cotton, and rice, and the orange, lemon, and date.

Material Revival of Spain; Population; and Distribution of Land.—Owing to a number of causes, Spain, at one time the most opulent kingdom in Europe, had in the 18th c. lapsed into a state of complete stagnation; the spirit of enterprise seemed extinct, and

ease and squalor to be preferred to labor and affluence. Before the commencement of the present century, however, the country began to throw off its lethargy, and since that time the rate at which it has been advancing toward a healthy condition of active life has become gradually accelerated. Since 1851 the onward movement of the nation has been as rapid as that of any of the great European powers. The population has greatly increased, and is increasing; agriculture, previously stagnant, is now carried on with activity and success; manufactures are multiplying rapidly; and railways, of which in the beginning of 1848, not a mile had been constructed, are now in process of being laid out between all the great centers of population—3,810 m. having been completed in 1875. A view of the increase of the population, the first basis of power, will afford an index of the growing prosperity of the country. The estimates of the population of Spain for various periods between the beginning of the 16th c. and the middle of the 18th c. vary considerably; but it is certain that there was a gradual decrease of from 2,000,000 to 3,000,000 of inhabitants between the years 1500 and 1700. With regard to later times, we have the following authentic statement:

Year.	Population.
1768.....	9,159,999
1797.....	10,541,221
1857.....	15,461,340
1860.....	15,673,536
1870.....	16,835,506

It thus appears that in about a century the population of Spain has increased over 7,000,000. Comparing the census of May, 1857, with that of Dec., 1870, we find that the provinces in which the population has most largely increased are Madrid, Barcelona, Pontevedra, Seville, Cadiz, Valencia, Alicante, Oviedo, Zaragoza, Jaen, and Guadalajara. These are for the most part maritime provinces, or such as, from their vicinity to the coast, have facilities for communication with the sea; and, this being the case, it may be fairly argued that the rapid extension of the railway system now going on, will—besides acting favorably on the whole kingdom—have a specially beneficial effect upon the interior provinces. In agriculture as well as in population, the onward movement has been remarkable. The vast mountains of the country affording for the most part only scanty crops of herbage, are utilized as pasture-grounds, and are divided into large farms. But in the warm and fertile plains, especially in localities where water is abundant, the farms are small. In 1860 there were 3,426,083 farms of all sizes, of which 750,000 were occupied by tenants, and the others by proprietors. Over 40 per cent of the whole surface of the kingdom is still uncultivated.

Origin of the People.—The Spaniards are a mixed race, and have sprung from a greater variety of stocks than any other European nation. The bulk of the people is doubtless descended in the main from the ancient Celtiberian occupants of the peninsula. At an early time, however, there were extensive Phenician and Carthaginian settlements in Spain, especially on the eastern sea board. Later, the country was penetrated with Roman elements, and was Romanized throughout, save in the Basque (q.v.) country, where the ancient speech still lives on intact. Gothic invasions left a large Germanic strain in the blood of Spain, which may yet be plainly traced in the hill-country of the n.e. The Arab conquerors of Spain planted themselves too firmly on Spanish soil to be utterly expelled; and the Moriscos (see Moors) are still, to the number of 60,000, easily distinguishable by their tongue and other peculiarities. In the s. and center Gypsies (*Gitanos*) are numerous, and there are some Jews. One result of this commingling of races may be seen in the strongly marked provincial peculiarities of Spain, extending not merely to dialectal differences, but to physique, character, and amusements. The Castilian is the literary language of Spain; the Andalusian diverges somewhat broadly from it; in Catalonia, Valencia, and on the Balearic isles, the prevailing dialect is closely allied to Provençal; while in the Basque provinces the old tongue is still in universal use among the people. Until lately (see *Fueros*), the Basques enjoyed quite peculiar privileges as to local government and administration. In spite of great local differences of character, the Spaniard is generally temperate, and his few wants are easily satisfied. He requires a daily siesta, is not very energetic by nature, loves music, dancing, and the bull-fight, and is not averse to intrigue and the use of weapons. Even amid poverty and squalor, native dignity never forsakes him. The houses are generally poorly furnished and uncomfortable, and often far from cleanly.

Religion.—Till very lately, the Roman Catholic faith, to which almost all the nation adheres, was the only creed tolerated by law. There are 9 archbishoprics, 51 suffragan bishoprics, and 4 unattached bishoprics. Before the suppression of the monasteries in 1836, about one-fifth of the whole nation was engaged in the service of the church.

Occupations of the People.—Agriculturists, laborers, miners, artisans, shepherds, and sailors constitute two-thirds of the population; one-seventh is composed of merchants and tradesmen; another seventh of officials, the army, the nobility, the clergy, nuns, beggars, and prisoners. The nobility is very numerous; the lower nobility, mostly quite poor, counting nearly 1,000,000 *hidalgos*. Beggars are almost as numerous, owing partly to the large number of benevolent institutions. In 1860 nearly 500,000 persons were maintained in 1028 charitable institutions.

Productions, Commerce, Exports and Imports, etc.—The total imports of Spain, including bullion and specie, in the years 1868–74, averaged 19 millions sterling per annum; while the exports averaged 12 millions sterling. The countries with which Spain trades most extensively are France, Great Britain, Cuba, British possessions, and the United States; and of these countries, Great Britain receives the great bulk of its exports, while France (owing, probably, to the vicinity of that country) supplies more of the imports of Spain than any other state. The foreign trade of the country is carried on most extensively at the following ports, which are set down in the order of their importance: Barcelona, Cadiz, Santander, Alicante, Mahaga, Valencia, Bilbao, Cartagena, San Sebastian, Elizondo, and Irun. The principal articles imported are, in the order of their importance, sugar, yarn, woolen fabrics, raw cotton, iron, machinery, coals, and dried fish; the chief articles exported are—wine, metals, dried fruit, flour, bullion, green fruits, olive oil, minerals, wool, grain, vegetables and seeds, cork, and salt.

The total imports from Spain into the United Kingdom were, in 1875, valued at £8,660,953; in 1876, at £8,763,146; in 1877, at £10,842,097. The exports from the United Kingdom to Spain amounted, in 1875 to £4, 294,490; in 1876, to £4,796,498; in 1877 to £4,267,214. The wine imported hither from Spain in 1875 was valued at £2,122,127; in 1876 at £2,076,538; and in 1877 at £2,017,112. In 1877, £467,800 worth of Spanish copper was imported; £1,671,272 of lead; £488,840 value of cattle; £316,586 of wheat; and near £90,000 of cork. About 5,000,000 gallons of olive oil are annually produced in the country, of which quantity the half is exported. Almonds, grapes, nuts, oranges, lemons, and raisins are also imported into Great Britain in immense quantities.

The cotton manufactures of Spain have been making considerable advance, and silk stuffs are largely fabricated. The principal cotton factories are at Barcelona. Excellent paper is made at Tolosa and Valladolid, and in the last named town there are a few minor manufactures. All the manufactures of tobacco, arms, and gunpowder are carried on by the government exclusively. Though neither the agricultural nor the mineral resources of Spain are properly developed, much progress has been evident of late years, chiefly in mining. Lead, copper, and tin are abundant; quicksilver is wrought; and there are large deposits of good coal and iron ore. The last, however, are so imperfectly worked, that great quantities of iron and coal are imported from Belgium and England.

In 1877 the mercantile marine of Spain consisted of 2,915 sea-going vessels (of which 230 were steamers), with a total burden of 557,320 tons. The number of Spanish vessels that entered British ports in 1875 was 485, of 225,577 tons.

Railways and Roads.—In Oct., 1848, the first Spanish railway, 18 m. in length, from Barcelona to Mataro, was thrown open to the public, and by the beginning of 1875, 3,810 m. of railway were open for traffic, and in the same year 1264 m. were in course of construction. The whole of the Spanish railways belong to private companies. In 1858, 6,164 m. of public roads had been constructed; in 1863, the length of public roads was 8,294 miles. The number of letters that passed through the post-office in 1857 was 38,704,788; in 1874 the number had increased to 75,300,000. In 1874 there were in operation in Spain 7,510 m. of electric telegraph. In 1857 there were 47 lighthouses in Spain, and 16 in process of construction; in 1863 there were 102 light-houses, and 34 in process of construction.

Army.—Official returns for the year 1876 state the active strength of the army as 151,668, of whom 60,000 were infantry, 11,000 were cavalry, 12,000 were engineers and artillerymen, the rest consisting of the *guardia civil* (gendarmerie), militia, *carabineros*, and the reserve.

Navy.—The navy consisted (at the end of June 1875) of 89 vessels (81 being steam vessels), carrying in all 914 guns.

Revenue and Expenditure.—The entire revenue of Spain, for the financial-year beginning July 1, 1874, and ending June 30, 1875, was 609,541,141 pesetas, equivalent to about £24,381,600. The expenditure for the same year was 605,125,569 pesetas, or about £24,205,000. The public debt amounted in 1875 to £375,000,000.

Education.—In 1851, there were, according to calculation, 22,317 schools, attended by 839,182 scholars; in 1868, the number of scholars had risen to 1,251,653. There are ten universities in Spain, in Madrid, Barcelona, Granada, Oviedo, Salamanca, Seville, Santiago, Valencia, Valladolid, and Zaragoza. Of the whole population of 1860, 3,129,921 could read and write, and apart from them, 705,778 could read; and although the state of education indicated by these figures does not seem to be advanced, it is a fact to be remembered that 14 years before—in 1846—only 1,893,288 could read.

History.—Spain, the *Spania*, *Hispania*, and *Iberia* of the Greeks, and known to the Romans by the same names, was inhabited at the period at which it first receives historical mention, by a people deriving their origin from different races. It is supposed to have been originally inhabited by a distinct race called Iberians; upon whom, however, a host of Celts are supposed to have descended from the Pyrenees. In the earliest times of which we have any record, these two races had already coalesced and formed the mixed nation of the Celtiberians, who were massed chiefly in the center of the peninsula, in the western districts of Lusitania, and on the n. coasts. In the Pyrenees and along the e. coast, were to be found pure Iberian tribes, while unmixed Celtic tribes occupied the n.w. In Bætica (Andalusia) there was a large admixture of

the Phœnician element, and on the s. and e. coasts, numerous Phœnician, Carthaginian, Rhodian, and other colonies. A portion of the s. coast, called Tartessus by the Greeks, the Tarshish of Scripture, was much frequented for its mineral riches by the Phœnician merchantmen, and the "ships of Tarshish" were as distinct a section of the Tyrian mercantile marine, as were the Spanish galleons of the 16th c., or our own Indianmen of more recent times. But the bond which connected the Iberians and the Phœnicians was purely of a commercial character. About the middle of the 3d c. B.C., the Carthaginian influence began to be much felt in Iberia, and a considerable tract of territory was brought under subjection to Carthage by Hamilcar (q.v.), who founded the city of Barcelona. During the next eight years, the Carthaginian interest was advanced, and its power further strengthened by Hasdrubal (q.v.—died 220 B.C.), son-in-law of Hamilcar who founded Carthago Nova (the modern Cartagena) and concluded a treaty with the Romans whereby it was stipulated that he should not advance his standards u. of the Iberus (Ebro). Hannibal (q.v.), son of Hamilcar, and the greatest of all the Carthaginian generals, now assumed the command in the peninsula. He attacked and destroyed Saguntum (q.v.), and thus violated the treaty made between his father and the Romans. The destruction of Saguntum was the cause of the Second Punic War, for the principal incidents of which see CARTHAGE, ROME, HANNIBAL, and the SCIPIOS. After the Romans had driven the Carthaginians from the peninsula in 206 B.C., the country was erected into a Roman province, consisting of two political divisions—*Hispania Citerior* (Hither Spain) including the eastern and northern districts or those nearest to the center of the Roman Empire; and *Hispania Ulterior* (Further Spain) including the districts furthest from Rome, or the southern and western districts. It was not, however, till 25 B.C. that the Cantabri and Astures in the extreme north of the country, laid down their arms to Augustus. After the country had been reduced to subjection, it was divided into the three provinces of Tarraconensis (embracing the northern and eastern provinces), Bætica (Andalusia), and Lusitania (Portugal and certain of the western provinces). This division of the country lasted till the reign of Constantine the great (q.v.), (306–37). From the time of the complete supremacy of the Romans till the death of Constantine, the condition of Spain was eminently prosperous. The inhabitants, when brought under the iron rule of the empire, were forced for the time to desist from the intestine wars in which it had been their habit to indulge, and adopting the language, laws, and manners of their conquerors, they devoted themselves to industrial pursuits, and increased remarkably both in wealth and in numbers. Everywhere throughout the country, towns of a purely Roman character sprang up, among the chief of which were Leon, Emerita Augusta (Merida), Pax Julia (Beja), Cæsar Augusta (Zaragoza); and numerous aqueducts, bridges, amphitheatres, etc., were built, the ruins of which are the wonder of the modern traveler. Spain, though obtained at enormous cost both in treasure and human life, was for three centuries the richest province of the Roman Empire. Its fertile fields formed for a considerable time the granary of Rome, and from its metal veined sierras, an immense amount of treasure in gold, silver, etc., flowed into the Roman coffers. "Twenty thousand pound-weight of gold," says Gibbon, "was annually received from the provinces of Austria (Asturias), Gallaecia, and Lusitania." This amount of wealth was not the voluntary offering of the natives, who were compelled to labor in their mines for the benefit of strangers; and thus Spain, in the early ages, was the type of Spanish America in the 15th and succeeding centuries, with the single difference that in the first case the Spaniards were the slaves, and in the second they were the slave-holders. In 409 A.D., hordes of barbarians, Alans, Vandals, and Suevi, crossed the Pyrenees and swept over and desolated the peninsula—the Vandals for the most part settling in Bætica, the Alans in Lusitania, and the Suevi in Leon and Castile. About 412, the Visigoths invaded the country, and their king, Athaulf, who acknowledged a nominal dependence on the Roman emperor, established the Gothic monarchy in Catalonia. See GOTHs. Of the Visigoths—by whom the Suevi were subjugated (584), the Vandals and Alans expelled (427) from the country, and large portions of Gaul annexed to their Spanish dominion—the most remarkable kings were Wallia (415–18), who greatly extended the Gothic monarchy; Euric (466–83), who, besides increasing his territory, introduced and enforced a body of laws, and did much for the advancement of civilization in Spain; Wamba (673–80), who built a fleet for the protection of the coasts; and Roderic (q.v.), who was killed at Xeres de la Frontera in 711, in battle with the Moors. The battle of Xeres gave the Moors almost undisputed mastery of nearly the whole of Spain, as well as of the outlying Gothic province of Septimania (Languedoc) in France; for the remnant of the Goths betook themselves to the highlands of Asturias, Burgos, and Biscay, where, in a region which throughout had enjoyed more liberty than any other part of Spain, they maintained their independent race.

Dynasty of the Moors.—The Arabs, or, as they are more properly termed, the Moors (q.v.), held Spain for the first few years of their rule, as a dependency of the province of N. Africa; but, after the downfall of Muza (q.v.), and his son Abd-el-aziz, who had been the deputy-governor of Spain, the country was governed (717) by *emirs* appointed by the caliphs of Damascus. The favorite scheme pursued by the Spanish emirs was the extension of their conquests into Gaul, to the neglect of the rising power of the Goths in Asturias; they also took the Balearic islands, Sardinia, Corsica, and part of Apulia

and Calabria; the Mediterranean was infested by their fleets, but their northward progress was most signally checked on the plain of Tours by Charles Martel (q.v.). Anarchy and bloodshed were prominent features of the first 40 years of Mohammedan rule in Spain. The *realis*, or local governors of districts and provinces, frequently rebelled against the emir, and drew sword against each other according as ambition or animosity dictated. Within this period of 40 years, no fewer than 20 emirs had been called to the direction of affairs; but a revolution at Damascus, which unseated the Ommiades, and placed the Abbasides in possession of the caliphate, put an end to this state of misrule in Spain. The last of the *emirs*, Jussuf, was in favor of the Abbasides, but the *realis* and *alcaydes* being chiefly of the Ommiade faction, invited one of this family, who was in concealment among the Zeneta Arabs in Barbary, to become an independent caliph in Spain. See OMMIADES. Thus was founded the *caliphate of Cordova*, from which, in 778, the Franks wrested all its possessions n. of the Pyrenees, and north-eastern Spain to the Ebro; the latter acquisition, subsequently denominated the *Spanish March*, being alternately in the hands of the Moors and dependent upon France.

Christian Kingdoms.—During this period of Moorish domination, the small independent kingdom of Asturias, founded by Pelayo (q.v.), had been growing in power and extent. It was increased by Galicia in 758, and by parts of Leon and Castile toward the close of the century. In 758 a second independent Christian kingdom was founded in Sobrarve, and increased by portions of Navarre on one hand and Aragon on the other, but though it, along with the French Gascons, aided the Moors at Roncesvalles (q.v.), it was, in 801, again swallowed up by the caliphate of Cordova. However, 36 years afterward a Navarrese count, casting off his allegiance to France, founded the third Christian kingdom, that of Navarre (q.v.), which from this time easily maintained itself, owing to its situation, in independence of the Moors. The kingdom of Asturias, now (900) Leon, was for a long time distracted by bitter and bloody strife among the members of the royal line, and with its neighbor Navarre would have fallen an easy prey to the powerful Ommiades, had not the latter directed their chief attention to the subjugation of Morocco; and under cover of this relaxation of the constant warfare between Moors and Christians, another independent monarchy, an offshoot from Leon, was founded in Castile (933, kingdom in 1035), which, from its central position, and consequent greater facilities for expansion, soon became the most powerful of the Spanish states, especially after its union (temporary, 1072–1157), in 1230, with Leon. A considerable part of Aragon had been wrested from the Moors by Sancho III. (1000–35) of Navarre, and at his death this part of his dominions passed by inheritance to his son Ramiro, who added to it the districts of Sobrarve and Ribagorza, and a considerable extent of country which he conquered from the common enemy, the Moors. This kingdom of Aragon was the last Christian kingdom formed in Spain; and though it increased by acquisitions from the Moors, yet being limited by Leon, Castile, and Navarre on one side, and the Spanish March (now only the county of Catalonia or Barcelona) on the other, its princes aimed at maritime power; and by the union, through the marriage of the count of Barcelona with queen Petronilla, of the Spanish March with Aragon, means were obtained of carrying out this policy, and the spread of the Aragonese dominion to Sicily (q.v.), Naples (q.v.), and other regions bordering on the Mediterranean, was the consequence. These three kingdoms—Castile and Leon, Navarre, and Aragon—continued, sometimes in combination and sometimes separately, to war against their common enemy, the Moors—Castile being, from its greater power and proximity, the most persistent assailant, and Navarre, for the opposite reason, the least so; but whenever the arrival of fresh levies from Africa, or the accession of an energetic caliph threatened serious danger to any one of the three, the others generally came to its aid.

The extinction of the Ommiades in Spain in 1031, and the disruption of the caliphate into the minor kingdoms of Cordova, Seville, Toledo, Lisbon, Zaragoza, Tortosa, Valencia, Murcia, Badajoz, and seven others of less note, was an occurrence by which the kings of Castile and Aragon did not fail to benefit, for by well-directed and unrelenting attacks they subdued some, rendered others tributary, the kings of Portugal also on their side gallantly and successfully pursuing the same policy; and a few years more would have certainly annihilated Moorish domination in Spain, had not Mohammed of Cordova and Seville, hard pressed by Alfonso VI. of Leon and Castile, about the close of the 11th c., applied for aid to an Arab tribe, whose military career in n. Africa had been of the most brilliant character. This tribe, the Almoravides—i.e., men devoted to the service of God—had made themselves masters of the provinces of Africa and Almagreb, and founded the empire of Morocco. Responding to the request of Mohammed, the Almoravides crossed over to Spain, defeated the king of Aragon and Castile, and recovered much of New Castile. Then, turning upon their ally Mohammed, they compelled him to yield up the provinces of Cordova and Seville, and all the minor Moorish princes to follow his example; so that, in 1094, the Almoravide sovereign was acknowledged sole monarch of Mohammedan Spain. The power of this tribe, however, began to decline about 1130, and was extinguished by the Almohades (q.v.), a fanatical sect of Mohammedans, who landed in Spain in the middle of the 12th c., and conquered the territories of the Mohammedans in Spain. During the reign of the third monarch of this dynasty took place the battle between the combined forces of Castile, Leon, Navarre, Aragon, and Portugal, with the Moors, in which the former gained the most celebrated victory

ever obtained by the Christians over their Moslem foes, the latter losing, according to the account transmitted to the pope, 100,000 killed and 50,000 prisoners. This sanguinary conflict, fought on the plains of Tolosa (*las navas de Tolosa*), July 16, 1212, broke the Almohade power in Spain, as that of Salamanca (July 22, 1212), almost exactly six centuries afterward, did the more formidable strength of Napoleon. On the fall of the Almohades, Mohammed-ben-Alhamar, the king of Jaen, rose to the first place among the Mohammedan princes, and founded (1238) the *kingdom of Granada*. The king of Granada was speedily forced to become a vassal of Castile, and from this period all danger from Moslem power was over. The rest of the history of the Spanish kingdoms before their union is undeserving of a detailed account. The Castilian court was the scene of almost constant domestic strifes and rebellions, varied with a campaign against Granada or in favor of the monarch of that kingdom against his rebellious vassals; the only prominent monarchs of this kingdom being Ferdinand III., who confined the Moorish dominion to the s. of Andalusia, Alfonso X. (q.v.), Alfonso XI., Pedro the Cruel (q.v.), and queen Isabella, the last sovereign of Castile, who succeeded her brother Henry IV., owing to a widespread belief in the illegitimacy of the latter's daughter. Aragon, on the other hand, was almost wholly free from intestine dissensions, doubtless owing so the interest taken by the Aragonese monarchs in Italian politics; of these sovereigns Jayme I. (1213-48) conquered Valencia and Majorca, and, first of all the Aragonese kings, received a voluntary oath of allegiance from his subjects; Pedro III. (1248-85), who obtained Sicily (1282), Minorca, and Iviza; Jayme II., who conquered Sardinia and Corsica; Alfonso V. (1416-68), who conquered Naples; and Ferdinand II. (q.v.), the Catholic, the last sovereign of Aragon, who, by marriage with Isabella, queen of Castile, in 1469, the conquest of Granada in 1492, and that of Navarre in 1512, united the whole of Spain (and French Navarre) under one rule.

The year 1492, in the reign of Ferdinand and Isabella, witnessed also the discovery of America, as well as the capture of Granada. Spain had now become consolidated into one empire, from the Pyrenees to the strait of Gibraltar, civil wars were at an end; and a splendid continent, teeming with riches, had been opened up for Spanish adventure and enterprise. But, as the most active spirits among the Spaniards now crowded to the new world, the soil of Spain, and its mineral treasures, both inexhaustible sources of wealth, were neglected for the riches of the fancied El Dorado, where, as was everywhere believed, gold was more plentiful than iron was in the old country. Besides the drain upon the country from emigration, the expulsion of the Jews and Moors was productive of the direst results; and the decline of the splendid Spanish empire, upon which the sun even then never set, may be said to have had its origin in the event which raised the country to the height of its magnificence. Charles I. (Charles V. of Germany, q.v.) succeeded Ferdinand, and in his reign Mexico (q.v.) and Peru (q.v.) were added to the possessions of Spain. Philip II. (q.v.), by his enormous war expenditure and maladministration, laid a sure foundation for the decline of the country. Industry, commerce, and agriculture, may be said to have been extinguished at the expulsion of the Moriscoes (see Moors); and the reigns of Philip III. and Philip IV. witnessed a fearful acceleration in the decline of Spain by the contests with the Dutch, and with the German Protestants in the thirty years' war, the intermeddling of Olivarez (q.v.) in the affairs of northern Italy, the rebellion of the Catalans, whom the minister wished to deprive of their liberties, the wars with France, and the rebellion of Portugal (1640), which had been united to Spain by Philip II. That of Charles II. was still more unfortunate, and the death of the latter was the occasion of the war of the Spanish succession (see SUCCESSION, WAR OF). Philip V. (q.v.) was the first of the Bourbon dynasty who occupied the throne of Spain. Under Charles III. (1759-88), a wise and enlightened prince, the second great revival of the country commenced; and trade and commerce began to show signs of returning activity. During the inglorious reign of Charles IV. (1788-1808), who left the management of affairs in the hands of the incapable Godoy (see ALCUDIA), a war (1796-1802) broke out with Britain, which was productive of nothing but disaster to the Spaniards, and by the pressure of the French another arose in 1804, and was attended with similar ill success. Charles abdicated in favor of his eldest son, the prince of Asturias, who ascended the throne as Ferdinand VII. Forced by Napoleon to resign all claims to the Spanish crown, Ferdinand became a prisoner of the French in the year of his accession, and in the same year Joseph, the brother of the French emperor, was declared king of Spain and the Indies, and set out for Madrid, to assume the kingdom thus assigned to him. But before this time, an armed resistance had been organized throughout the whole country. The various provinces elected juntas or councils, consisting of the most influential inhabitants of the respective neighborhoods, and it was the business of these juntas to administer the government, raise troops, appoint officers, etc. The supreme junta, that of Seville, declared war against Napoleon and France on June 6, 1808. In July, England, on solicitation, made peace with Spain, recognized Ferdinand VII. as king, and sent an army to aid the Spanish insurrection. Joseph, on July 9, entered Spain, defeated (through his lieutenant, Bessières) the Spaniards at Rio Seco, and entered Madrid on the 20th; but the defeat of Dupont at Baylen by the veteran Spanish gen. Castaños, somewhat altered the position of affairs, and Joseph, after a residence of 10 days in his capital, was compelled to evacuate it, and retire n. to Vitoria. The noble defense of Palafox of the city of Zaragoza against Lefebvre, and the return of the marquis de la

Romana with 7,000 regular troops who had been wiled from the country by Napoleon, did much to inspire the patriots. On July 12, 1808, sir Arthur Wellesley, afterward duke of Wellington (q.v.), at the head of the British auxiliary force, landed (Aug. 5) at Mondego bay, and began the peninsular war by defeating the French at Roliza and Vimiero (q.v.); but in spite of his opposition the convention of Cintra was signed, and the French transported to their own country. In Nov., 1808, Napoleon, who had been preceded by Ney (q.v.) with 100,000 men, entered Spain, and at once assumed the command. For a time his armies were completely successful; Soult utterly routed the Spanish gen. Belvedere, Nov. 10, and annihilated Blake at Reynosa on the 13th. Castaños and Palafox were routed at Tudela by Lannes, and in the beginning of December, Napoleon entered Madrid. At this time, the British forces were under the command of sir John Moore (q.v.), who, aware of his great inferiority in numbers and resources, retreated west from Salamanca, whither he had come to assume the command of the allied forces, and reached Coruña (q.v.) on Jan. 11, 1809. On April 22, gen. Wellesley arrived in Portugal, and at once commencing operations, drove Soult from Oporto, and took possession of Portugal; then, favored by the disunity of action which subsisted between the three or four French armies who held Spain, he directed his attacks upon the army of the center, retreating when any of the others came to its aid, and by dint of masterly generalship and bold enterprise, succeeded, after four campaigns, in driving the French from the country. To this result, the co-operation of the Portuguese and of the Spanish *guerrillas*, the revengeful hatred of the peasantry toward their tyrannical oppressors, and the drafts from the Spanish armies so frequently made by Napoleon for his wars in central Europe, largely contributed. See WELLINGTON, SOULT, VICTOR, etc. Napoleon, loath to lose his hold of the peninsula, sent Soult, his most trusted gen., to stop the ingress of the British into France; but the battles of the Pyrenees (July 24—Aug. 1, 1813), and of the Nivelle, Orthez, and Toulouse, in the beginning of 1814, brought to a victorious conclusion this long and obstinate contest.

In 1812 a constitution, on the whole liberal, had been devised for the country by the cortes of Cadiz. It was abrogated, however, by Ferdinand VII. (q.v.), who treated the subjects who had shown such devoted loyalty to him with infamous ingratitude, and obtained the aid of France to establish despotism. The reign of his daughter, Isabella II. was disturbed by the Carlist rebellion in 1834-39, in which the British aided the queen with an army under sir De Lacy Evans. See CARLOS. The next event of importance was the contest between Espartero (q.v.), the regent, and the queen-dowager Christina, for the supreme power during the minority of the queen. Espartero was successful from 1840 to 1843, but was compelled to flee before O'Donnell and Narvaez, and was not restored till 1847. The constituent cortes of 1837 drew up a new constitution, based on that of Cadiz. In 1845, another constitution was promulgated by Narvaez (q.v.), duke of Valencia. Frequent changes of ministry, occasional revolts, the banishment of queen Christina (1854), the formation of the O'Donnell ministry (1858), the war with the Moors (see MOROCCO), the annexation of St. Domingo in 1861, and the quarrels between Spain and her former colonies, Peru (1864-65) and Chili (1865), were the most marked events in the more recent history of Spain prior to 1868. In 1868 Isabella was driven from the throne by a general revolt; and the cortes, in Nov. 1870, elected prince Amadeo of Italy to be king. Finding the task of ruling constitutionally hopeless, Amadeo abdicated early in 1873, upon which the form of government was changed into a republic. During the remainder of 1873, and the whole of 1874, Spain was the scene of general anarchy and much bloodshed, resulting from the mutual opposition of the Carlists and republicans. On Dec. 31, 1874, Alphonso, son of the ex-queen Isabella, was declared king of Spain at Santander.

SPALATO (often erroneously called SPALATRO; in Illyric, *SPLIT*), an important seaport of Dalmatia, empire of Austria, is finely situated on a promontory on the eastern coast of the Adriatic. It originated in the famous palace of Diocletian, built in the 3d century. As this immense structure (which occupied 12 years in building) stood not far from the city of Salona, the great bulwark of Roman power in Dalmatia, it was called *Salona palatinum*, briefly written *S. palatinum*. When Salona was conquered by the Avars in the 7th c., the inhabitants fled for refuge to the fortress-palace of the emperor, where they laid the foundations of a new town, corruptly named *Aspalathum*, whence the modern *Spalato*. Even yet more than one-half of the town is compressed within the limits of the ancient palace, a considerable portion of whose walls still remain. The best preserved parts of the palace are the temple of Jupiter, transformed in the 7th c. into a Christian cathedral, and the temple of Æsculapius, which is now a baptistery dedicated to St. John. Modern Spalato is divided into an old and new town; the former consisting mainly of narrow, crooked, and dirty lanes; the latter more agreeable and open. It is the seat of a bishop, has a chamber of commerce and manufactures, and is the principal emporium for goods passing from Italy overland into Turkey. Pop. '69, 12,000.

SPALAX. See MOLE-RAT.

SPALDING, a co. in w. Georgia, bounded on the w. by Flint river; crossed by the Macon and Western, and the Savannah, Griffin and Northern Alabama railroads; 190

sq.m.; pop. '80, 12,585. The surface is undulating, the soil is fertile. The main products are cotton, corn, wheat, cattle, and swine. Co. seat, Griffin.

SPALDING, an important market t. and river-port in Lincolnshire, on the Welland, 8 m. from its mouth in the Wash. Considerable trade is carried on by the Welland, and vessels of 100 tons are able to reach the town. An important stock and corn market is held every Tuesday. A newspaper is published weekly. Spalding was a place of consequence as early as the Saxon times, and contained a Benedictine monastery. Pop. '71, 9,111.

SPALDING, HENRY H., 1810-68; b. Ky.; studied at St. Mary's and Bardstown; graduated at the Propaganda in 1837; was pastor of St. Joseph's Roman Catholic church at Bardstown in 1844; of the church in Louisville in 1849; and was vicar-general.

SPALDING, JOHN FRANKLIN, D.D., b. Maine, 1828; graduated at Bowdoin college in 1853, and at the general theological seminary, New York, in 1857; was minister of St. James's church, Protestant Episcopal, Oldtown, Me., 1857-59; rector of Grace church, Providence, R. I.; rector of St. Paul's church, Erie, Penn., 1862-74; elected missionary bishop of Colorado; consecrated bishop in 1873. He published *The Threefold Ministry*; *Manual of Prayers*, etc.

SPALDING, MARTIN JOHN, D.D., 1810-72; b. Ky.; educated at St. Joseph's, Ky., and Rome in 1834; became Roman Catholic bishop of Louisville in 1850; succeeded Dr. Kenrick as archbishop of Baltimore in 1864. He has published *Miscellanies*; *Early Catholic Missions of Kentucky*; *Lectures on the Evidences of Catholicity*; *History of the Protestant Reformation*, 2 vols. He edited with an introduction and notes the Abbe Darraz's *History of the Catholic Church*, 4 vols. He convened the second national council at Baltimore; was an active member of the Vatican council, 1870-71, and favored the doctrine of papal infallibility.

SPALDING, SOLOMON, 1761-1816; b. Conn.; graduated at Dartmouth college in 1785; pastor of a Congregational church in Connecticut in 1787; relinquished the ministry in three or four years, and became a merchant, first in Cherry Valley, N. Y., then in Ohio; removed to Pittsburg in 1812, and thence to Amity, Penn.; wrote a romance entitled *The Manuscript Found*, purporting to show that the American Indians were the descendants of the lost tribes of Israel. In 1814 he placed this manuscript in the hands of Sidney Rigdon (q.v.), a printer at Pittsburg. This is claimed, on what seems strong evidence, to be the origin of the *Book of Mormon*, though the Mormons deny this origin.

SPALDING, WILLIAM, 1809-59, b. Aberdeen, Scotland; educated at Marischal college; studied law and was called to the bar at Edinburgh in 1833; professor of rhetoric in the university of Edinburgh, 1834-45, and of logic at St. Andrews, 1845-59. He wrote many articles for *Blackwood's Magazine*, the *Edinburgh Review*, and the *Encyclopædia Britannica*. His article on *Logic* in the *Britannica* was published as a separate treatise. His *History of English Literature* has been a popular text-book.

SPALLANZANI, LAZARO, a celebrated anatomist and naturalist, was b. at Scandiano, in Modena, Italy, Jan. 12, 1729. After a careful education, he took clerical orders; and in 1754 he was appointed to the chair of logic, metaphysics, and Greek at Reggio; but soon after this he obtained a chair at Modena, and, refusing the tempting offers made him by the universities of Parma and Coimbra, and the academy of St. Petersburg, gave himself up to the study of natural history. His attention was directed to the doctrine of generation propounded by Needham and Buffon, which, after careful study and experiment, he overturned. He then turned his attention to the circulation of the blood, and was the first to follow its course through the intestinal tube, the liver, spleen, ventricles, pulmonary organs, etc.; "established," according to Senebier, "the propulsive power of the heart over the blood in the various vessels, demonstrated that the heart never wholly empties itself, explained the various causes which retard the circulation, and the obstacles produced by the weight of the blood." On the re-establishment of the university of Pavia, Spallanzani was appointed (1768) professor of natural history, and keeper of the museum, which he greatly enriched with fishes, crustacea, and testacea, the fruits of his numerous excursions. In 1785, refusing the chair of natural history at Padua, which had been so admirably filled by Vallisneri, he accepted the proposal of the archduke Ferdinand to accompany, with doubled salary, the Austrian ambassador to Constantinople (Aug. 22, 1785); and during a residence of 11 months in Turkey found ample materials for study and observation. In 1788 he visited Naples whilst Vesuvius was in eruption, the Lipari isles, and Sicily, in restless prosecution of his scientific labors, and then retired to Pavia, where, refusing the tempting offers of the French directory, he spent the remainder of his life, prosecuting his scientific researches amid bodily sufferings, and died of apoplexy, Feb. 12, 1799. His works, many of the more valuable of which have been translated into English, are too numerous to mention; but a complete catalogue of them, along with a biography, will be found in the *Bio-graphie Médicale*, vol. vii. See also, for the result of his labors, the *Eloge*, by M. Alibert, in the *Mémoires de la Société Médicale d'Emulation*.

SPAN, a natural measure of length, being the distance between the tips of the thumb and middle finger, the hand being stretched as much as possible. This space averages about 9 in., and the term came to denote a measure of 9 inches.

SPANCELED, in heraldry, a term applied to a horse two of whose legs are fettered by a log of wood.

SPANDAU, a t. of Prussia, in the province of Brandenburg, is situated at the confluence of the Havel and Spree, 9 m. w.n.w. of Berlin. Spandau is an important fortress; has a citadel (besides other fortifications) surrounded by water, with a garrison of upwards of 3,000 men, and is a military dépôt. Spandau carries on manufactures of arms, gunpowder, woolens, etc., and has an active transit-trade as a station on the Berlin and Hamburg railway. Pop. '75, 26,888. It is one of the oldest towns in the middle mark of Brandenburg, and was long the residence of the kurfürsts of the Hohenzollern house.

SPANDREL, the triangular space between the outside of an arch and a square head including it. This space is often filled with sculptured foliage, figures, etc.

SPANG'ENBERG, AUGUST GOTTLIEB, PH.D., 1704-92; b. Prussia; graduated at Jena, 1726, and lectured there; appointed adjunct professor and assistant superintendent of the orphan house, Halle, 1731; assistant to count Zinzendorf, 1734; founded the first Moravian settlement in America, at Savannah, Ga., 1735-39; returned to Europe and secured the settlement of Bethlehem, Penn.; organized the first Moravian society in England, at London, 1741; consecrated bishop, 1744, and went to America where for 18 years he superintended the whole Moravian work, making frequent journeys to the Indians, and being adopted into the Oneida nation; was a member of the college of bishops and elders to govern the whole Moravian church, 1762-90; 1764 was appointed supreme inspector in upper Alsace; and, in 1789, president of the general directory. His principal works are, *Life of Zinzendorf*, and an exposition of Christian doctrine which is the standard among the Moravians.

SPANGLES, small circular pieces of very thin metal, usually silvered or gilded tin, pierced with a needle-hole, so that they can be sewed on to cloth. They are chiefly used for decorating theatrical dresses.

SPANHEIM, EZECHIEL, 1329-1710; b. Switzerland; educated at the Geneva university, where at the age of 20 he was appointed professor of elocution. He was tutor to the son of the elector palatine Charles Louis, and was employed by him in political missions, and also by the elector of Brandenburg, by whom he was made a baron. After the peace of Ryswick he was sent to France and England. He wrote a number of commentaries on and translations of classical authors as well as some numismatic treatises.

SPANIEL, a kind of dog of which there are many breeds, differing considerably in size and other characters. None of the spaniels are large; some are amongst the smallest of dogs. Some are used for sporting purposes, others are merely kept as pets and companions. All of them are lively, playful, docile, and affectionate in a high degree. The spaniel is ever petitioning for regard, and shows boundless joy on receiving marks of kind attention. The **ENGLISH** or **SUSSEX SPANIEL** is of an elegant but moderately stout form; with very large pendant ears, of which the hair is very long; the muzzle rather broad; the tail bushy; the body covered with long silky hair; the colors various, very often liver-colored and white, or red and white. The name spaniel is said to indicate the introduction of this kind of dog into England from Spain. In the days of falconry spaniels were much used for starting the game. The **COCKER** (q.v.), the **SPRINGER** (q.v.), and the **BLenheim dog** (q.v.) are different kinds of spaniels. The **KING CHARLES'S SPANIEL** is a beautiful black and tan breed, almost as small as the Blenheim dog, and derives its name from Charles II., who took great delight in dogs of this kind. The **WATER SPANIEL** is one of the larger breeds. It has comparatively hard hair, and is distinguished by its readiness to pursue game by swimming. It is much used in decoy ponds to drive ducks into the net.

SPANISH FLY. See **CANTHARIS**, *ante*.

SPANISH GRASS. See **PAPER**.

SPANISH LANGUAGE AND LITERATURE. The Spanish language is one of the Romanic tongues, and, like the others, originated in the *lingua Romana rustica*. See **ROMANIC LANGUAGES**. The earliest of the different Spanish dialects that assumed a literary form was the Castilian, which gradually became, and has continued to be, the classic dialect of the nation. It finally blends a certain soft, lingering richness of cadence with an occasional sonorous majesty of expression, and on the whole may be considered one of the most beautiful of the European tongues. The course of Spanish conquest has also led to its establishment in Mexico, Central America, Cuba, Porto Rico, the greater part of South America, the Canary isles, and the Philippines. See the *Grammur and Dictionary* published by the Spanish academy (1771); the grammars of Keil (Leip. 1837); Fuchs (Berl. 1837); Wiggers, and Schele de Vere (New York, 1854). The best material for a historical grammar is furnished by Diez in his *Grammatik der Romanischen Sprachen*. The best Spanish dictionaries, besides that of the academy, are Cabrera's

(Mad. 1837); the Spanish-German by Seckendorff (3 vols. Hamb. 1823), and the Spanish-English of Neumann and Barette (re-edited by Velazquez, New York, 1852).

Literature.—The literature of Spain may, in a superficial sense, be regarded as commencing under the auspices of the Romans, for Lucan, Seneca, and other eminent Latin authors, were at least Spanish by birth; and, if we please, we may further look upon the Christian ecclesiastical writers of the Gothic period as the second link in the historical chain. But in the proper sense of the term, the literature of these two periods is no more *Spanish*—i.e., a national—than an English book by an Anglo-Indian is to be held as a portion of Hindu literature, or the sermons preached by a missionary to South Sea islanders are to be quoted as specimens of the literature of the Pacific. Passing over, then, the various developments of non-national literature in Spain—pagan Latin, ecclesiastical Latin, Arabic and Jewish—we come down to the 13th c., and then, for the first time after the gradual formation of a Spanish language, begin to notice the growth of something like a Spanish literature. Epic and didactic poems appear, written in Castilian verse, and full of strong national sentiment. The oldest of these is the *Poema del Cid* (see CID CAMPEADOR), of which only a single MS. exists. This MS. contains three other poems: *The Book of Apollonius, Prince of Tyre*; *The Life of our Lady, St. Mary of Egypt*; and *The Adoration of the Three Holy Kings*, the authorship of which (as of the *Poema del Cid*) is unknown. Other productions of this first period are the rhymed *Lives of the Saints*, by Gonzalo of Berceo (died about 1260); and the anonymous poem, *Count Fernan Gonzalez*, which, like the *Poema del Cid*, paints the earnest and picturesque struggle between the Moors and Spaniards. In all of these we trace the influence either of the church or of the chivalric poetry of France; but they maintain, nevertheless, a distinctively national and independent character. A great impulse was given to the artistic development of Spanish literature by Alfonso the wise of Castile (q.v.), who substituted Spanish for Latin in the courts of law, and fostered in many ways the growth of the national language. He is regarded as the founder of Spanish prose, his chief work in this department being the compilation of a series of codes, of which the most memorable is *Lus Siete Partidas*, and a translation of the Bible into Spanish. Subsequent princes walked in his steps, and achieved an honorable reputation both as authors and patrons of literature, conspicuous among whom was the Infante Don Juan Manuel (died 1347), whose *El Conde Lucanor* (count Lucanor) is a collection of 49 tales, apologies, etc., from oriental sources, and wearing an oriental aspect. The most remarkable Spanish poet of the 14th c. is Juan Ruiz, arch-priest of Hita (died 1351). His pieces, composed in a great variety of measures, number some 7,000 verses, and include religious and love songs, fables, pastorals, etc. The didactic tendency is particularly visible in the *Danza General de la Muerte* (dance of death).

The second period of Spanish literature embraces the later portion of the middle ages, and is marked by the presence of lyric poetry in considerable quantity, alongside of the didactic. It seems to have been inspired by the strains of the provençal poets settled at the court of the counts of Barcelona, and always continued to be more courtly than national. The most complete collection of this lyric poetry is the *Concecionero general* of Fernando del Castillo (Valencia, 1511; 10th edit., 1573), which contains the names of 136 authors, among which may be mentioned those of the marquis of Villena, and the marquis of Santillana, the three Mauriques, Macias, Sanchez de Badajoz, Alonzo de Cartagena, Diego de San Pedro, and Fernan Perez de Guzman. Against this court-poetry, however, a strong reaction took place, the national spirit re-asserting itself vigorously in ballads, chronicles, romances of chivalry, and the drama. The best collection of the ballads (about 1000 in all) is to be found in the *Romancero general* (13 vols., 1605-14); of the chronicles (half-genuine, half-fabulous narratives of ancient Spanish heroes), the best are those of Ayala, of Juan Nuñez de Villalaz, the *Chronicle of the Cid*, and the *Chronicle of the Travels of Ruy Gonzalez de Clavijo*; of the romances of chivalry, the most celebrated is the *Amadis de Gaul*, parent of innumerable others (see AMADIS); and of the drama, among the first specimens are the pastoral plays of Juan de la Enzina, and the *Celestina* of Fernando de Rojas.

The third period, extending from the 16th to the 18th c., is the most splendid and productive in the annals of Spanish literature. Under Charles V., Spain became the foremost state in Europe, and the conquest of Naples brought it into close relation with the literature of Italy. The great Italian masters, such as Dante and Petrarch, began to be studied, and Italian measures and poetic forms to be imitated, although the rich, strong, Spanish spirit is never lost. The first of this new school was Juan Boscan Almozer (died 1543), a brilliant sonneteer: other members of the same school are Garcilaso (q.v.) de la Vega, Diego Hurtado de Mendoza (q.v.), Francisco de Saa de Miranda, and Jorge de Montemayor (author of the once famous pastoral novel of *Diána* (see NOVELS), Fernando de Herrera (q.v.), and Luiz de Leon (died 1591), the last two of whom rank as the two greatest lyric poets that Spain ever produced. Gradually, a national drama established itself too. Conspicuous names in this department are Villalobos, Perez de Oliva, and Naharro (about 1517), sometimes regarded as the father of the Spanish drama. The last mentioned wrote his comedies in the favorite national measure, the *redondillas*, and divided them into three acts. Besides these, we must mention Lope de Rueda, Juan de la Cueva, and Geronimo Bermudez, who cultivated tragedy with success. Among the most eminent prose writers of the first section of

this third period was Geronimo Zurita, author of *Annales de la Corona de Aragon* (Annals of the Crown of Aragon, 6 vols.)—a somewhat critical work, showing a decided advance on the credulous chronicles of the monks; Oliva, whose *Diálogo de la Dignidad del Hombre* (Dialogue on the Dignity of Man) is a fine specimen of elegant literature; and Morales, author of *Discursos* (Essays), relating to practical philosophy; etc.—Cervantes (q.v.) marks, if not exactly a new era, at least a splendid outburst of Spanish genius. It is unnecessary here to criticise the productions of his genius; we may only note, as it were, historically the fact, that his immortal *Don Quixote* put an end to the romances of chivalry—or rather to the extravagant imitations of these that sprung up after the age of chivalry had passed away. Lope de Vega (q.v.), a contemporary of Cervantes, and Calderon (q.v.), gave the national drama a European renown, and had, especially the latter, a host of followers more or less celebrated, among whom are Francisco de Rojas, Agustin Moreto, Fragosa, Diamante, Antonio Hurtado de Mendoza, Juan de la Hoz, Antonio de Solís, and Agustin de Salazar y Torres. The lyric and “epic” poets of this period, which embraces the second half of the 16th, and the whole of the 17th c., are innumerable, but not great. The most notable names are those of the brothers Argensola, and Alonso de Ercilla y Zúñiga (author of *Araucana*, a fine poem on the conquest of Araucania in Chili by the Spaniards). A peculiar form of the novel also appeared, called the “rogues’ novel,” of which the only memorable specimen is the *Guzmán de Alfarache* of Mateo Aleman; and even it derives not a little of its importance from the fact that it suggested Le Sage’s *Gil Blas*. In history, the most distinguished names are those of Mariana (q.v.) and Solís.

The fourth period of Spanish literature extends from the accession of the Bourbons (1701) to the present time, and was long marked (like the contemporary literature of Germany) by a servile imitation of French models, and these by no means the best of their kind. This literary ascendancy of France in the first half of the 18th c. over all civilized Europe is a very curious phenomenon, worthy of closer study than it has yet received. The most notable of the Frenchified Spaniards was Ignacio de Luzan, whose *Poética* (1737) is a thoroughly Gallician performance. His efforts to denationalize the literature of Spain were combated by García de la Huerta and others, and at length a sort of compromise was effected, and the “Salamanca school” emerged into notice. Its founder, Malendez Valdez (b. 1754), was a man of high genius who subordinated his liberal culture to the sovereign control of a patriotic inspiration, and the same qualities are visible in its other members—Iglesias, Noroña, Quintana (q.v.), Cienfuegos, Arriaza, and Gallego. The great peninsular war, and the subsequent political movements in Spain, had a powerful effect in stirring up anew the elements of nationality, and the present century can show a lengthened list of names both in prose and poetry. We can only afford space for a few: Tapia, Maury, Juan Bautista Alonso, Jacinto de Salas y Quiroga, Espronceda, Serafin Calderon, Zorrilla, Hartzenbusch, R. de Campoamor, Santos Lopez Pelegrin, Villergos, and G. Gomez de Avellaneda, in poetry; Saavedra, Mora, Zorrilla Gregorio Romero y Larranaga, Manuel de Santa Ana, in romantic fiction; Leandro, Fernandez Moratin, in the drama; Ulloa, Muñoz, Capmany, Ferreras, Quintana, Navarrete, Clemencin, Torreno, and Maldonado, in history; Jovellanos, Arguelles, Miñano, Marina, Donoso Cortes, Martinez de la Rosa, etc., in political oratory.

Spain has not as yet achieved great results in any departments of science, either physical, mental, or moral; but of late years she has turned her attention seriously to scientific studies, and several admirable treatises in jurisprudence, political economy, medicine, philosophy, philology, and geography have been produced.—See Bouterwek’s and Sismondi’s *Histories of Spanish Literature*; and above all, Ticknor’s work on the same subject (3 vols., New York; 1849–54), which has been translated into Spanish.

SPANISH MACKEREL (*MACKEREL, ante*) The name Spanish mackerel is applied to different kinds of fishes; in the United States more particularly to the *cybium maculatum*, a slender, compressed, fusiform fish, having many rays in the dorsal and anal fins. Color bluish green above, a beautiful satin white below, with yellowish spots on the back and sides. As found in the market they vary much in size, weighing usually from one and a half to four pounds, although they are sometimes caught weighing seven or eight pounds. They are natives of tropical seas, but they range along the Atlantic coast from Brazil to cape Cod. A noted locality for them is the Chesapeake bay, where they are much larger generally than those which go farther north. They are among the very finest of fish for the table, and are peculiarly adapted to broiling, being juicier than almost any other fine fish, much more so than other kinds of mackerel. Along the coast of Cornwall, England, the name of Spanish mackerel is applied to the *scomber colias*, which much resembles the common mackerel, *scomber scombrus*, having much fewer rays in the dorsal and anal fins than the Spanish mackerel of the western Atlantic coast, and being also much smaller. See *MACKEREL, ante*. The common mackerel is an important article of commerce. They are split and salted in small barrels and small tubs called kits, and assorted and numbered according to their quality, No. 1, No. 2, and No. 3, No. 1 being the largest and finest.

SPANISH MAIN (i.e., *main-land*), a name generally given during the 16th c. and the earlier part of the 18th to the n.e. coast of South America, from the Orinoco to the isthmus of Darien, as also to the contiguous southern portion of the Caribbean sea,

traversed by the Spanish treasure-ships. The name occurs very frequently in connection with the history and exploits of buccaneers (q.v.).

SPANISH TOWN, the seat of government of the British possession of Jamaica (q.v.), on the right bank of the Cobre, and 10 m. w. of Kingston. It contains several important public institutions, is ill-built and unhealthy, and contains about 6,000 inhabitants.

SPANISH WINES. Of all the vegetable productions of Spain the vine is the most important, the lands being almost everywhere favorable to its culture. The excess of the vintage above the quantity consumed in the country forms a considerable branch of the export trade. In 1877 Spain exported to Great Britain alone 6,803,794 gallons, costing £2,017,112. The wines grown in almost all parts of the country have much taste and bouquet, and great strength and durability, if subjected to proper treatment. In the preparation of white dry fortified wines, such as sherries, and in the confection of some sweet wines, such as Malagas, the Spaniards excel all other nations. Andalusia, an extensive region in the s., contains the belt of vineyards producing the *vino secco* and the *abocado*; there also is Rota, famous for its red wine. From this province come the wines of Moguro, or Moguer, Negio, Rancio, and Seville. Catalonia yields annually 20,000 butts of wine, mostly red. The Catalan was formerly shipped largely to South America, and much of it is at present exported to England and sold as Spanish port. Valencia produces annually 100,000 butts of wine, from which by distillation 20,000 butts of spirits are manufactured. The best qualities are grown on the hill-sides; the greatest quantities in the plains. Aragon produces dark-colored strong-bodied wines of good taste and flavor from the celebrated vines, the Grenache of Sabayes and the Carriña, and delivers them up to the trade of Saragossa. Granada, with its famed Malaga, produces wines and raisins. In the mountains of Malaga the vine attains almost tropical luxuriance, and bears three harvests every year. Galicia produces some good wine for exportation, such as Ribaclavia and Tuy, but the climate of Navarra is not favorable to viticulture, and the produce of Roncesvalles is insufficient to supply local demand. Biscaya, the most northern province of Spain, produces much wine. New Castile, with its renowned La Mancha, produces very agreeable wines, such as the muscat of Juencarral, near Madrid. Near these are the wines of Spanish Tagus, from Arganda del Rey, above Madrid, to Talavera de la Reyna. Murcia produces thick rough wines, and the island of Majorca produces a malvaisie wine, which is exported by way of Palma. Minorca produces a red dark wine around Aleyor, and the "Albafiora," a light white wine of much bouquet. The Spanish governments have frequently encouraged the production of wine, and have during late years given great liberty to trade, but the main obstacle was the difficulty of transport, now, however, being rapidly removed by foreign enterprise and by railways.

SPANKER, a large quadrilateral sail, with parallel sides, set between the gaff and boom of a ship. Its fore-leech is attached by rings to the mast. The spanker is a fore-and-aft sail of great importance in bringing the vessel to the wind.

SPAR (Ger. *Spath*), a term used by miners to denote any bright crystalline mineral, and which has been adopted by mineralogists in the names of a number of minerals, as calcareous spar, fluor spar, etc., in which, however, it has no proper generic significance.

SPARIDÆ, a family of acanthopterous fishes, having a general resemblance to the perch family—a single dorsal fin, which is not protected by any scales, and of which the anterior rays are spinous, the pectoral and ventral fins sharp-pointed, the tail-fin notched; the gill-cover shining, without proper spines or denticulations; the palate destitute of teeth; the scales large, broader than long, and generally thin. There are several sections of the family distinguished by the teeth, which in some are all small and card-like, while others have trechant, conical, and round molar teeth, variously arranged. The greater number inhabit the seas of the warm parts of the world; many species are found in the Mediterranean; a few on the coasts of Britain. Among the British species are the gillhead (q.v.), and several species of different genera, known by the common name of sea bream (q.v.). The sparide are generally good for food, and some are highly esteemed. Among them are *sargus* of the Mediterranean (*sargus Rondeletii*), much valued by the ancient Romans, and the sheep's head (*sargus ovis*) of the North American seas, which commands a very high price in the New York market.

SPARKS, JARED, American historian, was b. at Willington, Conn., May 10, 1789; graduated at Harvard university in 1815; became tutor in mathematics and natural philosophy, and one of the conductors of the *North American Review*. In 1819 he was settled as a Unitarian minister at Baltimore, when he wrote *Letters on the Ministry, Ritual, and Doctrines of the Protestant Episcopal Church*. In 1821 he established a periodical called the *Unitarian Miscellany and Church Monitor*, in which he first published his *Letters on the Comparative Moral Tendencies of the Trinitarian and Unitarian Doctrines*. In 1823 he edited six volumes of essays and tracts on theological subjects, and, abandoning the pulpit, became for seven years sole editor of the *North American Review*. In 1828 he published a *Life of John Ledyard, the American Traveller*; and from 1834 to 1837 edited at Boston 12 octavo volumes of the *Writings of George Washington*. This important national work was followed by the *Diplomatic Correspondence of the American Revolution* (12 vols. 8vo, Bost. 1829-30), and the *Life of Gouverneur Morris* (3 vols.

Svo, Bost. 1832). At this period he commenced the *American Almanac of Useful Knowledge*, and began also his *Library of American Biography*, first issued in two series of 10 and 18 vols. 18mo. In 1840 was published his collection of the *Works of Benjamin Franklin* (10 vols. 8vo), after which he visited Europe to collect materials for his *Correspondence of the American Revolution* (4 vols. 8vo, 1854). He also wrote, in 1852, two pamphlets, in answer to Lord Mahon, on the *Life of Washington*. Besides these multifarious literary labors, combining laborious research with clear arrangement, a simple style and accurate statement, he filled, from 1839 to 1849, the McLean chair of history, and from 1849 to his departure for Europe in 1852, that of president of Harvard university. Sparks died Mar. 15, 1866.

SPARROW. *Passer* or *Pyrgita*, a genus of birds of the family *fringillidæ*, having a strong conical bill, the upper mandible slightly curved, the lower mandible compressed and shorter than the upper, the nostrils partly concealed by the short feathers at the base of the bill, the legs moderately long and stout, the claws sharp and curved, the tail moderately long, and nearly even at the tip. The species are not very numerous, and are exclusively found in the old world. The COMMON SPARROW, or HOUSE SPARROW (*P. domesticus*), plentiful everywhere in the British islands, and too well known to require description, is found also throughout Europe, abounding particularly in the northern countries, from which its range extends eastward into Siberia, and southward to the n. of Africa and of India. Of all British birds the sparrow is the boldest in its approaches to man. Town sparrows are not mere visitors from the neighboring country, but constant inhabitants of the town itself, with the smoke of which their plumage is begrimed. The sparrow in its best plumage is not a very beautiful bird, nor has it such elegance of form as many others of the finch tribe; it has no melodious song, but its habits are interesting, and its frequent lively chirp pleasing. Sparrows often congregate in great flocks, particularly in autumn, when they find rich supplies of food in the ripened grain. The sparrow is one of the most omnivorous of birds. Animal and vegetable food seem equally acceptable to it. During summer vast numbers of insects and their larvæ are devoured by sparrows, and in this way they make amends for their plunder of the grain in autumn, which they begin as soon as it is sufficiently ripened, and continue as long as there are sheaves in the field. Their depredations have induced many farmers to use means for their destruction. They are good to eat, though little used for this purpose in Britain. It is otherwise in France, where all the small birds are sought after as articles of food. But the destruction of sparrows may be carried too far; and in France it has been followed by an increase of caterpillars, vastly more injurious to crops than the sparrows themselves. The sparrow makes a very inartificial nest, collecting a quantity of hay, or some similar material, in a hole of a wall, and lining it with feathers; sometimes, but more rarely, building a rude dome-shaped nest in the higher branches of a tree. Apart from the habitations of man, which it so much frequents, it often builds in crevices of rocks, or in cliffs on the sea-coast, or under the shelter of the nests of rooks, one rook's nest sometimes covering several nests of sparrows. Several broods are produced in succession, and the breeding season is prolonged over the whole summer, one brood succeeding another. The summer plumage of the sparrow is more brilliant than that of winter, and the female is of more sober plumage than the male, exhibiting indeed almost no variety of color.—The TREE SPARROW (*P. montanus*), the only other British species, is very similar to the common sparrow, but of rather smaller size. It is also a widely distributed bird, frequent over great part of the old world. It is rarely seen in towns.—In Italy the common sparrow is rare to the s. of Piedmont; and another closely allied species (*P. cisalpina*), takes its place, very similar in its habits as well as in its characters.—In America there are numerous species of *fringillidæ*, popularly known as sparrows, of which the WHITE-THROATED SPARROW (*zonotrichia albicollis*) is most nearly allied to the true sparrows. The nostrils are in a small groove, and the tail is slightly forked.—The hedge sparrow (q.v.) is a bird very different from the true sparrows.—The name sparrow is popularly given in different parts of the world to many different birds, chiefly *fringillidæ*.—The bird called sparrow in the English translation of the Bible is a species of thrush.

SPARROW-HAWK. *Accipiter* or *Nisus*, a genus of *falconidæ*, ranked among the ignoble birds of prey (see *FALCONIDÆ* and *FALCONRY*). The bill is curved from the base, short, and compressed; its upper ridge rounded and narrow; the cutting margin of the upper mandible with a distinct festoon. The wings are short; the legs long, slender, and smooth. Only one species is British—the COMMON SPARROW-HAWK (*A. nisus*, *A.* or *N. fringillarius*), a small hawk, only about 12 in. in length, a considerable portion of the length belonging to the tail. It is found in almost all parts of Britain, and in Asia as far s. as Bengal, and as far e. as Japan. It is not found in America. It very often makes its nest in the deserted nest of a crow. It is a bold, active bird, very destructive to poultry and pigeons. The sparrow-hawk has often been trained for the purposes of falconry, to take land-rails, partridges, and similar game. The sparrow-hawk of Australia (*A. torquatus*) is marked by a collar of numerous bars of white. Its habits are very similar to those of the European sparrow-hawk.—The American sparrow-hawk (*falco sparverius*), common in most parts of the United States, is similar in size to the European sparrow-hawk, but is rather allied to the kestrel.

SPARTA, anciently **LACEDÆMON**, the capital of Laconia, and the most famous city of Peloponnesus, occupied partly a range of low hills on the right bank of the Eurotas, and partly the intervening plain. Its appearance, even in its palmiest days, was by no means equal to its renown, for though not destitute of handsome public buildings, the severe law ascribed to Lycurgus, that "the doors of every (private) house should be fashioned only with the saw, and the ceiling with the axe," exercised a cramping influence on the development of architecture and of the fine arts generally. The natural defenses of the place, or at least of the long valley of Lacedæmon in which Sparta stood, were so great that it continued unfortified down to the Macedonian period—nearly a century after its mighty struggle with Athens for the hegemony of Greece; and, indeed, it was not regularly fortified till the time of the tyrant Nabis (195 B.C.). Previous to the Dorian conquest the primitive Achæans of Sparta seem to have dwelt in four or five scattered hamlets.—These hamlets were welded into one city, so to speak, by the conquerors, and became known as town-districts. The acropolis of Sparta occupied a hill in the northern part of the city, and was adorned with a temple to Athena (the tutelary goddess of Sparta), plated with bronze, whence it was called the brazen house, and the goddess herself *Chalciceus* (the dweller in the brazen house). On the bronze plates were beautifully sculptured various Greek myths. At the eastern base of the acropolis stood the agora, or market-place, whence streets proceeded to the different quarters of the city. Here stood the public buildings of the magistrates. The agora contained many statues. The principal street in Sparta, called the *Aphetaïs*, ran S. from the agora to the southern wall, through the most level part of the city, and was lined with a long succession of monumental edifices, chiefly *heroa* and sanctuaries. Along the banks of the Eurotas stretched the *dromos* (race-course), in which were several *gymnasia*, with temples of the Dioscuri, of the Græces, etc., and numerous statues; and still further S. lay a broader level, *Platanistas*, so called from the plane trees that grew there. This was the scene of those mock contests in which the Spartan youth learned to face without fear the realities of war.

The history of Sparta is really the history of Laconia. When the four hamlets, the *Pre-Dorian* Sparta, originated, we have no knowledge; but it cannot be doubted that their inhabitants were Achæans. It is during the rule of the Achæan princes that the events of the famous, but unhistorical, expedition against Troy, forming the subject of Homer's *Iliad*, are described as taking place. Menelaus, husband of Helen, whose flight with Paris occasioned the Trojan war, was king at Sparta, and it was during the reign of his grandson, Tisamenus (according to the legend), that the Dorians (q.v.) invaded Peloponnesus. The *fact* of a Dorian invasion is universally admitted, but of the details, scanty even as they are, we may safely be skeptical. We cannot even be certain of the date of the event, or even of the century in which it occurred. All that is clear is that the native Achæan population were deprived of political privileges, and appear henceforth as *periæci* (q.v.) and Helots (q.v.)—the Dorian conquerors alone forming the historical Spartans. Toward the middle of the 8th c. B.C. the Dorians of Sparta had not only thoroughly established themselves in their new settlement, but had subjugated the whole of the fertile and beautiful vale of Lacedæmon, commonly known as Laconia, and had begun to cherish ambitious views of extending their supremacy over the other Dorian settlements in Peloponnesus, viz., those of Messenia and Argos. Hence originated the Messenian wars (see **MESSENIA**), which terminated (668 B.C.) in the complete overthrow of the Dorians of Messenia, who were reduced by the victorious Spartans to the condition of *periæci*. Similar struggles occurred both with the older Achæan inhabitants in the center of Peloponnesus and with the Dorians of Argos, etc., in which the Spartans were generally successful. The development of their warlike and ambitious character is usually ascribed to the institutions of Lycurgus (q.v.); and whatever we may think of that more than semi-mythical personage, the institutions that go under his name were well fitted to make the Spartans exactly what they figure in history—a race of stern, cruel, resolute, rude, and narrow-minded warriors, capable of a momentary self-sacrificing patriotism (as in the story of the 300 heroes who fell at Thermopylæ), but utterly destitute of the capacity for adopting or appreciating a permanently noble and wise policy. The outbreak of the Peloponnesian war (431 B.C.) brought the rivalry between Sparta and Athens to a head, and in the mighty struggle that ensued, victory declared on the side of the combatant least capable of maintaining the greatness of Greece. Sparta now attained the hegemony of Greece; but her insolent tyranny in the hour of her triumph excited the indignation of those whom she held in virtual subjugation, and the glorious retaliation of the Thebans under Epaminondas (q.v.) stripped her of all her splendid acquisitions, and reduced the Laconian state to its primitive boundaries. Later, the rise of the Macedonian power limited still more the Spartan territory, nor did it ever after attain its earlier dimensions. Finally, after a series of vicissitudes, Sparta passed into the hands of the Romans, became a portion of the Roman province of Achaia, and shared the fortunes of the great republic.

SPARTACUS, the leader in the great insurrection of Roman slaves in southern Italy which took place 73 B.C., and in all probability the first servile captain in point of genius of whom history preserves a record, was a native of Thrace, and originally followed the occupation of a shepherd, but afterward became a robber-chief. Having the mis-

fortune to be taken prisoner, he was placed in a training-school for gladiators kept by one Lentulus Batiatus, at Capua. A conspiracy to escape was formed among the gladiators (200 in all, and mostly Gauls and Thracians), the heads of which were Spartacus, and two Gauls, Crixus and Oenomaus. The conspiracy was discovered; but 70, among whom were the leaders, forced their way through the streets of Capua with cleavers and other such rude weapons as they could seize, defeated a detachment of Roman soldiers sent to bring them back, and established themselves on Mt. Vesuvius, where they received considerable accessions to their number—chiefly runaway slaves. Three thousand Roman troops under C. Claudius Pulcher sought to blockade them here and starve them into surrender. Spartacus was now chosen as their leader, with Crixus and Oenomaus for his lieutenants. Descending the hill at a place and in a way totally unexpected, he took his assailants in the rear, and inflicted on them a disgraceful defeat. His original design had been limited to securing his freedom, and making his way back to his own country, nor during the two years that the insurrection lasted did he ever forget this ultimate aim; but in order effectually to carry it out, he recognized the necessity of a far more serious and extensive warfare than had yet been waged, and proclaiming freedom to all slaves, he contrived to raise his trivial mutiny to the dignity of a servile war. Circumstances were favorable. A great portion of Italy, especially of central and southern Italy, had been turned into pasture-land (see *ROME*), and instead of villages of sturdy and independent farmers, who owned the land they tilled, gangs of discontented slaves watched the flocks and herds of great nobles, demoralized by a plethora of ill-gotten riches. It was to these slaves that Spartacus appealed, and his summons was not in vain. Thousands upon thousands rushed to his standard, and victory followed him wherever he went. The story of his triumphs reads like a romance. No knight of chivalry was ever more uniformly successful, for a time. After defeating Claudius Pulcher, he routed and slew Cossinius, legate of Publius Varinus; then he worsted Varinus himself in several engagements, capturing his lictors and the very horse on which he rode. All the southern part of the peninsula now fell into his hands: the country was devastated, the cities either pillaged or garrisoned. But Spartacus knew too well the enormous resources of Rome, and the extraordinary energy which she was capable of exhibiting in the hour of peril, to hope for final success, and he consequently sought to induce his victorious bands to march northward to the Alps, and disperse to their own homes, the Gauls to the west, and the Thracians to the east. But the slaves were too deeply intoxicated with their success to see the wisdom of his proposal, and Spartacus had to continue his career of mere fighting against his better judgment, and embarrassed by the jealousies that are so apt to spring up among undisciplined and servile hordes. What brilliant gallantry and skill he showed, is known to all readers of Roman history. After the defeat and death of his lieutenants who had separated from him (72 B.C.), he marched north through Picenum toward the Po, overthrew first one consular army under Cn. Cornelius Lentulus and then another under Gellius Poplicola, and at the head of 100,000 men, meditated a march on Rome. Since the days of Hannibal, there had never been such danger! Fortunately, servile indecision and unwisdom saved the city. Spartacus was forced by his followers to retreat south, and took up his winter-quarters at Thurii, where he held a great fair for the sale of the spoils of Roman cities. In 71 B.C., Crassus (q.v.) took the field against the terrible slave-leader, but for a while even he could do nothing. Near Mintina, the proconsul, C. Cassius Longinus, and the proprætor, Cn. Manlius, were defeated; in Picenum, Mummius, a legate of Crassus's, was utterly routed; at last, however, Crassus succeeded in forcing Spartacus into the narrow peninsula of Rhegium, whence he tried to get into Sicily, with the view of rekindling the servile war that had recently raged in that island, but failed in his attempt, through the treachery of those with whom he had opened negotiations. Crassus now built lines of circumvallation to hem him in, and force him to surrender; but one stormy winter-night, Spartacus broke out of the toils prepared for him, and resumed the offensive, although he had suffered heavily by loss and desertion, and his forces were still further diminished by the formation of an independent army of Gallic slaves, which had no sooner got a leader of its own, than it was annihilated. Near Petelia, he once more defeated his adversaries; but seeing clearly that with such wretched materials as he had he could not hold out much longer, he made a dash at Brundisium, hoping to seize the shipping in the harbors, and get safely across the Adriatic to his native shore, but was baffled by the presence of Lucullus (q.v.). Pompey, too, had returned from Spain. There was nothing left for Spartacus but to die as gallantly as he had lived. Drawing up his army in battle-array, and solemnly slaying his war-horse, he began his last fight in a spirit of heroic desperation, and after performing prodigies of valor, fell unrecognized among the heaps of his slain foes. After his death, the slave insurrection was at an end.

SPARTANBURG, a n.w. co. of South Carolina, bordering on North Carolina, crossed by the Spartanburg and Union and the Atlantic and Richmond Air-line railroads; drained by Pacolet and Tiger rivers; 900 sq.m.; pop. '80, 40,408. The surface is hilly, and largely covered with forests of oak and hickory; the soil is fertile. The main productions are wheat, oats, cotton, sweet potatoes, butter, wool, and tobacco. Horses, mules, asses, cattle, sheep, and swine are raised in great numbers. It has manufactories of tanned and curried leather, carriages and wagons; also, cotton and flour mills. Co. seat, Spartanburg Court-house.

SPASM (Gr. *spasma*) consists in an irregular and violent contraction of muscular parts—involuntary even when the voluntary muscles are concerned. There are two sorts of spasm. In one there is an unusually prolonged and strong muscular contraction, not rapidly alternating as usual with relaxation, the relaxation only taking place slowly and after some time. This is known as *tonic spasm* (Gr. *tônōs*, a bracing up) or *cramp* (q.v.). "When in a more moderate degree affecting the voluntary muscles generally, it constitutes catalepsy (q.v.), in which, from the muscles remaining contracted, the limbs will retain whatsoever attitude they are placed in until the spasm is over. But the extreme example is tetanus (q.v.), in which the spasms are so violent and so enduring that they may be said to squeeze the patient to death."—Williams's *Principles of Medicine*, 2d ed. p. 72. In the other form of spasm, the contractions of the affected muscles take place repeatedly, forcibly, and in quick succession; the relaxations being, of course, equally sudden and frequent. This is named *clonic spasm* (Gr. *klônōs*, an agitation, and is popularly known as *convulsions*. Chorea (or *St. Vitus's dance*), epilepsy, and convulsive hysteria afford examples of this kind of spasm.

The treatment varies according to the cause of the excessive muscular irritability. Firm pressure on muscles affected with spasm will promote their relaxation, and by strong steady pressure on the masseter muscles, the lower jaw has been depressed, so as to open the mouth in cases of lock-jaw. The medicines which are employed to counteract irregular or inordinate muscular action are termed *antispasmodics*; but spasm may depend upon so many different causes, that the remedies which are found most successful in combating it must vary extremely in their nature. There are, however, a few medicines which appear to exercise a control over spasmodic action generally. These may be termed *pure* or *true* antispasmodics. They are asafetida, corydalis umbellifera (or common navel-wort), wood-soot, galbanum, musk, rue, sagapenum, sumpb (jatamansi or musk-root), and valerian. Among the narcotics often useful in these affections we may especially mention belladonna, cannabis indica (or Indian hemp), opium, and stramonium. Sulphuric ether in draught or inhaled, and inhaled chloroform, are often of service. In some cases remedies which directly depress the vital powers, such as the prolonged use of the warm bath, or even, in rare cases, the abstraction of blood, are the most effectual means of subduing spasm.

SPATHE (*spatha*), in botany, a sheathing bract which incloses one or more flowers, as in the *narcissus*. Very frequently the flowers within a spathe are arranged upon a *spadix*, which is a succulent spike, with numerous flowers, and of which a familiar example may be seen in *arum maculatum*. The spadix is a characteristic feature of the palms, and in them is compound or branching, and in general is not only provided with a common spathe, but with secondary spathes at its divisions.

SPAULDING, LEVI, D.D., 1791–1875; b. New Hampshire; graduated at Dartmouth college 1815; at Andover theological seminary, 1818; sailed as a missionary of the American board for Ceylon 1819; reached Jaffna, 1820. He lived for a number of years in Manepy. In 1833 he, with Mrs. Spaulding, removed to Oodooville, and took charge of the Oodooville central school for girls. For about 40 years, with untiring patience, sympathy, and care, they watched over the little ones, sometimes to the number of 120 or 130; receiving them usually when about eight years of age, and seldom parting with them until they were married. Mr. Spaulding was fluent in the use of the language, and his originality and power of illustration gave him ready access to the native mind. He preached Christ by the roadside, in the field, in the school-room. His literary work was multitudinous; not only were school-books, hymn-books, tracts, gospels, continually passing through his hands for revision and proof-reading, but he wrote and translated some small but valuable books and some excellent hymns, besides preparing an English and Tamil dictionary, and a Tamil dictionary, and aiding in the revision of a Tamil version of the Scriptures. He visited America once in the 54 years of his life among the heathen. The native converts throughout the district loved him as a father, and many of the heathen mourned his death.

SPAVIN, a disease of horses, occurs under two different forms, both interfering with soundness. In young, weakly, overworked subjects, the hock-joint is sometimes distended with dark-colored thickened synovia or joint-oil. This is bog or blood spavin. Wet bandages, occasional friction, a laxative diet, and rest should for several weeks be diligently tried; and if such remedies prove unsuccessful, the swelling must be dressed with strong blistering ointment, or fired. The second variety of spavin is the more common and serious. Toward the inside of the hock, at the head of the shank-bone, or between some of the small bones of the hock, a bony enlargement may be seen and felt. This is bone spavin. At first there is tenderness, heat, swelling, and considerable lameness; but as the inflammation in the bone and its investing membrane abates, the lameness is less perceptible, although the animal continues to drag his leg and go stiffly. In recent and slight cases, cold water should be applied continuously; but in serious cases, when the limb is swollen and tender, hot fomentations are best. For several days they must be perseveringly employed. When the limb is again cool and free from pain, an iodide of mercury or fly-blister should be applied, and the animal treated to three months' rest in a small paddock, the end of a barn, or a roomy loose-box. In persistent cases, firing or setoning usually gives much relief.

SPEAKER, the name given to the presiding officer in either house of parliament. In the house of lords, the lord-chancellor, or lord keeper of the great seal, is *ex-officio* speaker, and one or more deputy-speakers are appointed by commission to take his place in his absence. Since 1851 it has been the practice to appoint but one deputy-speaker, who is the chairman of the lords' committee, and should he also be absent, the house can choose a speaker *pro tempore*. The speaker of the lords may speak or vote on any question, and has no more authority than any other member of the house.

In the house of commons, the speaker is a member elected to that office at the desire of the crown, and confirmed by the royal approbation given in the house of lords. A similar office seems to have existed as early as the reign of Henry III., when Peter de Montfort signed and sealed an answer of the parliament to pope Alexander, *vice totius communitalis*; but the title speaker was first given to sir T. Hungerford in the reign of Edward III. The speaker of the house of commons presides over the deliberations of the house, and enforces the rules for preserving order: he puts the question and declares the determination of the house. As the representative of the house, he communicates its resolutions to others, and conveys its thanks or its censures. He is thus the mouth-piece of the house, whence his title seems to be derived. He issues warrants in execution of the orders of the house for the commitment of offenders, for the issue of writs, the attendance of witnesses, the bringing up prisoners in custody, etc. The mace is borne before him by the sergeant-at-arms when he enters or leaves the house; when he is in the chair it is left on the table, and it accompanies him on all state occasions. He cannot speak or vote on any question, but on an equality of voices he has a casting vote. Both by ancient custom and legislative declaration, he is entitled to take precedence of all commonsers.

Down to the year 1853 no provision existed for supplying the place of the speaker of the house of commons when he was unavoidably absent; but in that year the house, with consent of the crown, resolved that in his absence the chairman of the committee of ways and means should take the chair, and as deputy-speaker he was in 1855 invested, both by resolution of the house and by act of parliament, with the same authority *pro tempore* as the speaker.

SPEAKER (*ante*). The speaker of the U. S. house of representatives is a member of the house, chosen from among themselves for the office, and during the time of his holding it receives double the salary (\$5,000) of a member. He presides over the sessions of the house: makes the appointments of members of committees; signs all its bills, resolutions, and acts of authority; certifies to the mileage, etc., of members; and appoints three of the regents of the Smithsonian institution. He can be removed from his position by an act of the house.

SPEAKING. See **READING**.

SPEAKING-TRUMPET, an instrument for giving concentration rather than dispersion to the waves of sound originated by the articulation of the human voice, and thereby enabling the sound to be conveyed to a greater distance. It is of the utmost use on shipboard in enabling the officers to convey orders during windy weather from one part of the deck to another, or to the rigging. The invention is ascribed to sir Samuel Morland, in 1670, though Athanasius Kircher laid claim to it. Morland's trumpet was of the same form as that now in use, viz., a truncated cone, with an outward curve or lip at the opening.

The theory of the action of this instrument has never been thoroughly explained; but it is supposed that the sides of the tube throw the sound back and back in various reflections, until ultimately the waves quit the instrument in parallel lines. It does not seem to depend on vibration of the instrument.

SPEAR, a pointed weapon with a shaft of greater or less length for thrusting, throwing, or receiving an assault. See **JAVELIN**, **LANCE**, **PIKE**.

The *spear-foot* of a horse is his far foot behind.

SPEAR, SAMUEL P., 1815-75; b. Boston, Mass.; enlisted in the army, 1833; served in the Florida and Mexican wars under gen. Scott; was wounded at Cerro Gordo. He was assigned to duty on the frontier, 1848-61, and engaged in the operations in Utah under gen. A. S. Johnston. In the war of the rebellion he recruited and commanded the 11th Penn. cavalry, was wounded twice at Five Forks, promoted to brig.-gen. and brevetted maj. gen. for gallant service. He died from disease contracted in the army.

SPEAR, SAMUEL THAYER, D.D., b. N. Y., 1812; graduated at the college of physicians and surgeons, New York, 1833; studied theology with Dr. Beman of Troy; was ordained and settled pastor of the Presbyterian church, Lansingburg, N. Y., 1835, and of the South Presbyterian church, Brooklyn, 1848; became one of the editors of the *Independent*, 1870. His publications are *The Family Power: Eighteen Sermons on the Rebellion*; *The Legal-Tender Acts considered in Relation to their Constitutionality and Political Economy*; *Religion and the State*, or *the Bible and the Public Schools*. He is an earnest advocate of the secularization of the government.

SPEARMINT. See **MINT**.

SPECIAL CASE is the name given in the law of England to a statement of facts submitted to a court for its opinion as to the proper application of the law, or proper legal

inference to be drawn from such facts. It is drawn up by mutual agreement of the parties, and may be agreed upon at any stage of the suit, or even before any step has been taken in it.

SPECIAL JURY is a jury consisting of a superior class of men, such as esquires or persons of higher degree, bankers, or merchants selected by the sheriff, and formed into a separate list. Either party to an action may demand a special jury, but he must pay the extra expense, provided the judge do not certify at the conclusion of the trial that it was a proper case to be tried by a special jury, in which case the costs are part of the costs in the cause. Each special jurymen gets a guinea for his attendance on the case. The advantage of a special jury is, that the jurors are less likely to be carried away with vulgar prejudices, and more intelligent, and able to understand difficult cases.

SPECIAL LICENSE, in the marriage law of England, means a license obtained from the archbishop, which enables the priest to marry the parties without the publication of bans, and also at any time or place other than those necessary in ordinary cases. The statute of 25 Henry VIII. c. 21, entitled an act concerning Peter Pence and dispensations, continued to the archbishop of Canterbury the same right as the pope previously had to grant special licenses to marry at any convenient time and place. By a regulation of archbishop Secker in 1759, the privilege is restricted to children of peers, and privy counsellors, judges, baronets, and knights. The same conditions apply to applicants as in other cases, except that the special license merely authorizes a different time and place for the marriage than in other cases. The stamp-duty is £5.

SPECIALTY DEBT, in English law, was a debt constituted by deed under seal, as a bond, which in the event of the debtor's death had a right of prior payment over simple contract (q.v.) debts. Such preference is, since 1870, abolished, except where a lien or other security is held for the debt.

SPECIES, in natural history, a term employed to designate groups inferior to genera (see GENUS), but superior to varieties (see VARIETY). In mineralogy, the term is of very arbitrary application, serving only, like class, order, genus, etc., the purpose of classification, although it thus indicates common characters or points of real agreement among minerals. In organic nature, it has usually been regarded as possessing a higher and more definite signification. But no term is more difficult to define. Many definitions have been proposed, but none wholly satisfactory; every attempt at definition involving more or less the adoption of some disputed theory. If, for example, a species is regarded as including all the beings which have descended from parents created with the essential characters now belonging to the species, not only is the original creation in that particular form taken for granted, but likewise the impossibility of changes in nature, which some of the most eminent naturalists regard as actually taking place, and the belief of which implies no doubt of the act of creation itself, but only a certain opinion as to some of the laws by which organic nature is governed. To regard species as mere indeterminate and fluctuating groups, capable of indefinite modification in the lapse of ages, is equally to adopt a theory. If a species is defined as containing all the individuals which are capable of intermingling without consequent sterility of progeny, other difficult questions must be decided before the definition can be adopted as to any classes of creatures, while to many kinds it seems incapable of application, and much that is merely theoretical is involved in it.

Naturalists have very generally regarded species as unchanging throughout the longest succession of generations, except within narrow and marked limits, and have substantially adopted the definition of Buffon: "A *species* is a constant succession of individuals similar to and capable of reproducing each other." Thus De Candolle, the eminent botanist, says: "We unite under the designation of a *species* all those individuals that mutually bear to each other so close a resemblance as to allow of our supposing that they may have proceeded originally from a single being or a single pair." And Cuvier, the great zoologist, describes a species as "a succession of individuals which reproduces and perpetuates itself." Here it may be remarked, that even if the permanence of species implied in these definitions were fully ascertained, and their original creation in their present form admitted as unquestionable, it would by no means follow that we must suppose every species to have proceeded from a single individual or a single pair. Nor, accepting the Biblical statement concerning the human race, that all mankind are the offspring of a single pair, are we entitled to infer that such has been the case also as to all animals and plants capable of freely intermingling, and which, therefore, are commonly regarded as forming one species.

But the separate creation and immutability of species are disputed, some naturalists maintaining that species undergo modification, and that existing forms of life have descended by true generation from pre-existing forms. Lamarck was the first to proclaim this doctrine, at least so as to attract much attention, about the beginning of the 19th century. He held that all species, even including man, are descended from species of inferior organization; while to account for the existence of very simple forms at the present day, he had recourse to the supposition of their spontaneous generation. He was followed, with greater caution, by Geoffroy Saint-Hilaire, who regarded what we call species as various degenerations of the same type, but did not believe that the existing species are now undergoing modification. Similar views have since been stated

by many authors. But the works which have most strongly directed attention to them, and in which they have been most fully advocated, are the *Vestiges of the Natural History of Creation*, by an anonymous author, originally published in 1844, and which has since passed through many editions; and Darwin's work *On the Origin of Species by means of Natural Selection*, originally published in 1859. Of the other supporters of these views, the most eminent is prof. Huxley, who, without fully adopting the views either of the author of the *Vestiges* or of Darwin, advocates "the hypothesis which supposes the species living at any time to be the result of the gradual modification of pre-existing species," and maintains that to suppose each species of plant and animal to have been formed and placed on the surface of the globe at long intervals by a distinct act of creative power, is an assumption "as unsupported by tradition or revelation as it is opposed to the general analogy of nature."

It is impossible for us to do more than very briefly exhibit the principal arguments which have been urged on this question. Lamarck rested much on the well-known effect of use or exercise in strengthening and enlarging an organ, and of disuse in atrophying it. "He conceived that, an animal being brought into new circumstances, and called upon to accommodate itself to these, the exertions which it consequently made to that effect caused the rise of new parts: on the contrary, when new circumstances left certain existing parts unused, these parts gradually ceased to exist. Something analogous was, he thought, produced in vegetables, by changes in their nutrition, in their absorption and transpiration, and in the quantity of caloric, light, air, and moisture which they received. This principle, with time, he deemed sufficient for the advance from the monad to the mammal." The author of the *Vestiges* from whom this account of Lamarck's views is taken, regards him as in error "in giving this adaptive principle too much to do;" and says: "In the present day, we have superior light from geology and physiology, and hence comes the suggestion of a process analogous to ordinary gestation for advancing organic life through its grades, in the course of a long but definite space of time, with only a recourse to external conditions as a means of producing the exterior characters." The author of the *Vestiges* designates the principle for which he contends that of *Progressive Development*, and states it as follows: "The proposition determined on, after much consideration, is, that the several series of animated beings, from the simplest and oldest up to the highest and most recent, are, under the providence of God, the results, *first*, of an impulse which has been imparted to the forms of life, advancing them in definite times, by generation, through grades of organization terminating in the highest dicotyledons and vertebrata, these grades being few in number, and generally marked by intervals of organic character which we find to be a practical difficulty in ascertaining affinities; *second*, of another impulse connected with the vital forces, tending, in the course of generations, to modify organic structures in accordance with external circumstances, as food, the nature of the habitat, and the meteoric agencies, these being the 'adaptations' of the natural theologian." He further regards the *nucleated vesicle* as "the fundamental form of all organization, the meeting point between the inorganic and the organic," and as "the starting point of the foetal progress of every higher individual in creation, both animal and vegetable." Founding on instances of the production of the *proximate principles* of which organic substances are composed in the laboratory of the chemist, he goes on to say that "an operation which would produce in these the nucleated vesicle is all that is wanting effectually to bridge over the space between the inorganic and the organic;" and that "it does not seem, after all, a very immoderate hypothesis, that a *chemico-electric operation, by which germinal vesicles were produced*, was the first phenomenon in organic creation, and that the second was an *advance of these through a succession of higher grades, and a variety of modifications* in accordance with laws of the same absolute nature as those by which the Almighty rules the physical department of nature." He regards the idea of species or specific distinction, therefore, "as merely applicable to certain appearances presented, perhaps transiently, to our notice." He adduces instances of great changes of form and character known to take place in the lower departments of nature, both animal and vegetable, as giving probability to the supposition, that in a long succession of generations, great changes may take place also in the higher.

The whole theory of the author of the *Vestiges* as to organic nature has been exposed to objection in consequence of its connection with views of the general system of the universe altogether foreign to the present subject; and because of an evident inclination to the belief in a transition from inorganic to organic existence by chemico-electric operation. The argument is also weakened by the too ready acceptance of unsubstantiated facts, as of the transmutation of one kind of grain into another; and by resting too much on what may be reckoned the mere mistakes of naturalists, as to the forms of the lower kinds of plants and animals, of which genera and even tribes have been constituted, that have afterward been found to be mere modifications or larval stages of creatures very different in their most apparent characters. Much hostility has been also excited by the extension of the theory of development to the human species, connecting man with pre-existing and inferior forms of animal existence. All this has been avoided by Darwin, by whom, however, the chief arguments of the *Vestiges* are used with great scientific caution.

Darwin's views are distinguished by the introduction of what he designates the prin-

ciple of *natural selection*. He maintains the variability of species, and adduces much evidence to show that variation is continually taking place in consequence of the external conditions to which plants and animals are subjected. He rests much on the difficulty of distinguishing between varieties and species, and on the changes which are known to result from cultivation and domestication. He dwells on the *selection* which man makes in order to produce new breeds or varieties, and supposes a similar "selection" to take place in nature, in the *struggle for life*, which all plants and animals must undergo. This *struggle for life* is, in fact, the foundation of his theory. He shows that every kind of plant or animal must maintain it, and in order to its continued existence, must be successful in maintaining it not only against those other creatures which seem to make it their food, but still more in a competition with those which seek the same nutriment with itself. In this struggle the stronger, or those which possess anything peculiarly favorable in their organization, must overcome the weaker, and these must therefore cease to exist. Thus a slight variation, such as often takes place, may be perpetuated; and the possessors of any advantage in the means of procuring food, or in the powers of offense or defense, may entirely displace their less favored congeners. The modifications thus taking place Darwin regards as accounting for the changes in organized beings from one geologic period to another, and for the great differences in the plants and animals of different parts of the world. In support of his views, he argues from the tendency to variation seen in cultivated plants and domestic animals, and the perpetuation of the forms so produced in breeds and races; and from the fact that the variations in cultivated and domestic species are in some cases greater than those which are regarded as affording grounds of specific, and sometimes even of generic or greater distinctions in a state of nature. "Can it be thought improbable," he says, "seeing that variations useful to man have undoubtedly occurred, that other variations useful in some way to each being in the great and complex battle of life, should sometimes occur in the course of thousands of generations? If such do occur, can we doubt—remembering that many more individuals are born than can possibly survive—that individuals having any advantage, however slight, over others, would have the best chance of surviving and of procreating their kind? On the other hand, we may feel sure that any variation in the least degree injurious would be rigidly destroyed. This preservation of favorable variations and the rejection of unfavorable variations, I call *natural selection*. Variations neither useful nor injurious would not be affected by natural selection, and would be left a fluctuating element, as perhaps we see in the species called polymorphic." He further supports these views by pointing out the favorable opportunity for the operation of natural selection afforded in a country undergoing great physical changes, as of climate; and particularly in an island, or a country surrounded by barriers sufficient to prevent the ready immigration of species. "In such cases," he says, "every slight modification, which in the course of ages chanced to arise, and which in any way favored the individuals of any of the species by better adapting them to their altered conditions, would tend to be preserved; and natural selection would thus have free scope for the work of improvement."

Mr. Darwin supposes new variations to be continually taking place, but the greater number of these speedily to become extinct; while others, becoming perpetuated, and perhaps causing the extinction of the original forms, again give rise to other forms, until some of them have so widely diverged that all traces of their common origin are lost. He does not, however, commit himself to the opinion that all forms of organic life, or even all plants, or all animals, have a common origin. He completely rejects Lamarck's notion that new and simple forms are continually being produced by spontaneous generation. "I need hardly say," he remarks, "that science in her present state does not countenance the belief that living creatures are now ever produced from inorganic matter," and he accounts for the existence of low forms of life by saying that "natural selection includes no necessary and universal law of advancement or development; it only takes advantage of such variations as arise and are beneficial to each creature under its complex relations of life." So that even the lowest forms might "be left by natural selection unimproved, or but little improved," as geology tells us of infusoria and rhizopods which have remained for an enormous period in nearly their present state.

That species differ not only in single characters, but in many, Mr. Darwin accounts for by reference to unknown laws of the correlation of organs—laws, however, which, although unknown, we know to exist, so that a modification of one organ is attended with modification of other organs, as is exemplified in our domestic breeds.

In further support of the theory of natural selection, the fact is insisted upon, "that it is the common, the widely diffused, and widely ranging species, belonging to the larger genera within each class, which vary most." That the several subordinate groups in any class of creatures "cannot be ranked in a single file, but seem rather to be clustered round points, and these round other points, and so on in almost endless cycles," Mr. Darwin thinks incapable of explanation, except on the supposition of community of origin and natural selection. He points also to the analogous manner in which species of the same genus vary, as corroborative of his views. He accounts for the absence or rarity of transitional varieties by supposing the predominant forms to have taken possession of their districts, while these were in process of being stocked; and that these districts, differing much in their natural characters, the forms originating in the com-

paratively unextensive intermediate tracts, have not been able to contend against them, and have become extinct. He points out the possibility that areas now continuous may not have been so during a long period, and that species may have been formed while they were broken up into islands. But this remains a chief difficulty of his theory.

He ascribes to natural selection the results which Lamarck ascribed to use and disuse in the development and atrophy of organs; and thinks it not impossible that the flying squirrels may thus have had a common origin with the true squirrels, and the *galeopithecus* with the lemurs, although he admits that we have no graduated links of structure connecting them together. "Nor can I see any insuperable difficulty," he says, "in further believing that the membrane-connected fingers and forearm of the *galeopithecus* might be greatly lengthened by natural selection; and this, as far as the organs of flight are concerned, would convert it into a bat." Like Lamarck and the author of the *Vestiges*, Mr. Darwin rests not a little on the unity of type throughout whole classes of creatures, and the homologies of parts very different from each other, as in the four-limbed structure of the vertebrata generally, and even the articulations of the limbs. He endeavors to trace the eye from its simplest to its most perfect form, and shows how gradual are the transitions found on comparison of existing creatures, from the one to the other. He goes even further, and says: "Several facts make me suspect that nerves sensitive to touch may be rendered sensitive to light, and likewise to those coarser vibrations of the air which produce sound."

He dwells at great length on the subject of hybridism, and the general sterility of hybrids, endeavoring to show that it presents no insuperable objection to the theory of a gradual modification of species, their sterility being incidental on other differences, and sterility occurring, as he labors to prove, when varieties are crossed, as well as in the hybrids of distinct species. The difficulties presented by geology he obviates very much by insisting on the imperfection of the geological record. He does not adopt the view of the author of the *Vestiges*, that the geological record exhibits to us a succession of animals corresponding in their progressive development with the fetal development of the mammalian embryo. But he founds an argument on the many connecting links in the general system of nature which fossils supply when compared with existing species. And he endeavors to show that his theory is perfectly consistent with the known facts of the geographical distribution of species, and in particular with the remarkable facts of the peculiarity of the fauna and flora of some of the lonely oceanic islands, and of the frequent occurrence of the same species both in cold regions comparatively near the pole, and on mountains far remote from each other in lower latitudes; referring the latter class of facts to former geologic periods, when the continental areas were not the same as now, or when the prevailing climatic conditions were very different. And he finds support for his views in the correspondence, without identity, of the floras and faunas of the northern parts of America and of the Old World.

It is but a very imperfect sketch which we have thus been able to give of Darwin's theory, and of the arguments by which it is supported. Whatever may be thought of the truth of the theory, it must be admitted to be admirably framed and guarded, and to be maintained not only with great ingenuity of argument, but by the aid of a vast store of scientific information, most skillfully used. Its opponents condemn it as resting on unwarrantable assumptions, and demand some proof, for example, of the transition of organs from a simple or rudimentary to a complex and more perfect state. They also refuse to acknowledge such imperfection of the geological record as Darwin's argument demands, and they insist much on the completeness of the changes which that record discloses, and the absence of transitional forms both among fossils and existing species. Much of what Darwin and other advocates of the same general views contend for, they admit; a certain power of development in organic nature, a "struggle for life," and "natural selection;" but they regard the limits of development and variation as comparatively narrow. Nor would the state of the question, as they believe, be materially affected, if many of what have hitherto generally been regarded as species, should be proved to be mere varieties. Any number of such errors of naturalists might be exposed and corrected, without modification of our views of the laws of nature; and errors of this kind are precisely such as might be expected, when the forms of organic life began to be discovered and described, and ere yet there was time for their mature study in all parts of the world, and under all various circumstances.

The doctrine of Darwin, or the *Evolution Theory* as it is usually named, continues to be a fruitful source of controversy. It has found many adherents in all countries, and its leading principle—"the survival of the fittest"—has been applied in other fields of inquiry besides natural history. It ought to be mentioned that the eminent naturalist, A. R. Wallace, unaware of the speculations Mr. Darwin was engaged in, had elaborated independently a very similar scheme; and the prior publication of Darwin's labors was chiefly accidental. The opponents of Darwinism are perhaps more numerous than its adherents. The majority ground their arguments on the dangers they apprehend from it; they believe that its reception would sap the foundations of religion and social order. But men of science bring against it a formidable array of more legitimate arguments, many of which it is found difficult to answer satisfactorily. Nevertheless the doctrine seems to be working its way into general acceptance.

SPECIFIC GRAVITY of any body is the proportion which the weight of a certain bulk of that body bears to the same bulk of another body, which is taken as a standard. The standard for substances solid and liquid is distilled water at the temperature of 62° Fahr., barometer 30 inches; and the weight of a cubic inch of this standard is given in the Parliamentary Reports for 1825 as 252.456 troy grains, hence a cubic foot of it weighs 997.129 avoirdupois ounces, or 62.32 avoirdupois pounds. It is convenient to remember that a cubic foot of water weighs about 1000 ounces avoirdupois, as the error resulting from employing this estimate does not amount to much more than $\frac{1}{350}$ th of the whole. For æriform bodies, the standard is atmospheric air, a cubic inch of which, at a temperature of 32° Fahr., weighs .32693, and at 60° Fahr., .30935 grains troy. The specific gravity of solid bodies is best measured by the hydrostatic balance—a figure of which is given under Archimedes, Principle of (q.v.)—which gives the weight of a volume of water equal in bulk to the solid, by which it is only necessary to divide the weight of the solid in air to obtain the specific gravity; that of liquids may be obtained by the areometer (q.v.), or by comparing the weight lost by a solid body in the liquid and in water, and dividing the former by the latter—or by means of the *specific-gravity bottle*, which holds exactly 1000 grains of distilled water in its standard condition. The bottle is emptied of water, filled with the liquid, and then weighed; the result gives the weight of a volume of the fluid equal in bulk to 1000 grains of the standard, and hence this weight divided by 1000 gives the specific gravity. The specific gravity of an æriform fluid is determined by weighing a glass globe filled first with the fluid and then with atmospheric air. Annexed is a table of the specific gravity of a few of the more common substances:

SOLIDS (METALS).

	Sp. Gr.		Sp. Gr.
Iridium (hammered)	23.	Iron	7.78
Platinum	20.15	Tin	7.29
Gold	19.25	Zinc	7.19

SPECIFIC LEGACY. See LEGACY.

SPECIFIC PERFORMANCE, in English law, is the compulsory execution or carrying out of a contract in its details, the court of chancery generally having alone jurisdiction to enforce specific performance. In Scotland, the corresponding phrase is *implement*. As a general rule the courts do not attempt to enforce specific performance, but as a substitute give the party injured by the breach of contract satisfaction in the shape of damages.

SPECTACLES, for the purpose of aiding the sight when impaired by age or otherwise (see SIGHT, DEFECTS OF), were invented during the 13th century. The merit is attributed

by some to Alexander di Spina, a Florentine monk, and by others to Roger Bacon. At first they were exceedingly clumsy, both in the lenses themselves and also in their frames; and but little improvement took place in them until the beginning of this century, when light metal frames were introduced, instead of the cumbersome horn or tortoise-shell mountings, which are still occasionally seen, and have obtained the name of goggles. So skillful are the workmen of Wolverhampton, where they are chiefly made, in the manufacture of steel frames, that some of exquisite workmanship are now turned out, which, with their lenses complete, are under a quarter of an ounce in weight. They have consequently displaced gold, silver, and all other materials, when comfort and effectiveness are preferred to useless show combined with inconvenience. The lenses themselves are nearly always made of the best optical glass, and by the best makers are ground with extreme care. Many profess to be made of "pebbles," or rock-crystal; but lenses really made of that material are exceedingly rare, and have no real advantage over good glass.

SPECTER BAT, *Phyllostoma*, a genus of bats having two membranous crests on the nose, the one leaf-like, the other in the form of a horseshoe. This gives to their face that peculiar appearance from which they derive their popular as well as their scientific name. The species are numerous, and all natives of the West Indies and South America.

SPECTROPHONE and **PHOTOPHONE** or **RADIOPHONE**. The action of these instruments depends upon the phenomena of radiant energy which within a few years have been observed by different physicists, but whose practical results, if the time has arrived when the term may be used, have been principally accomplished by prof. Alexander Graham Bell, the inventor of the speaking telephone in common use, in conjunction with Mr. Sumner Tainter. The invention of the photophone arose from the employment by Willoughby Smith of selenium as a resistance medium in testing submarine cables. It was found that the resistance of selenium to the galvanic current varied considerably, and the discovery was made that this was caused by the action of light, which lessened the resistance. When selenium is exposed to the action of the solar spectrum, the maximum effect is produced, according to Sale, just outside of the red end of the spectrum, in a point nearly coincident with the maximum of the heat rays (see *Radiation* in article HEAT, *ante*), but according to Adams it is produced in the greenish-yellow or most luminous part of the spectrum, and he moreover found that selenium was sensitive to the cold light of the moon. E. W. Siemens discovered that heat and light produced opposite effects upon some extremely sensitive varieties of selenium. In some of his experiments the resistance on exposure to light was only one-fiftieth of what it was in the dark. It occurred to prof. Bell to substitute the telephone for the galvanometer hitherto used in these experiments on account of its great sensitiveness to electrical influences; but in doing so it was necessary to vary the action of light so that the intermissions from light to darkness should be sudden, in order to produce a succession of changes in the conductivity of the selenium corresponding in frequency to the musical vibrations within the limits of hearing; and upon further consideration it appeared to him that all the audible effects obtained from varieties of electricity could also be produced by variations of light acting on selenium. In an article in *Science* of Sept. 11, 1880, he says: "I saw that the effect could be produced at the extreme distance at which selenium would respond to the action of a luminous body, but that this distance could be indefinitely increased by the use of a parallel beam of light, so that we could telephone from one place to another without the necessity of a conducting wire between the transmitter and receiver. It was evidently necessary, in order to reduce this idea to practice, to devise an apparatus to be operated on by the voice of the speaker, by which variations could be produced in a parallel beam of light, corresponding to the variations in the air produced by the voice." But a difficulty was found in the fact that the resistance of selenium was too great to respond sufficiently to the action of light; this, however, was overcome by reducing this resistance—from some half million *ohms* to 300 in the dark, and to 155 in the light. The fundamental features of the selenium photophone are best given in prof. Bell's own words: "We have devised about fifty forms of apparatus for varying a beam of light in the manner required. The best and simplest form consists of a plain mirror of flexible material—such as silvered mica or microscopic glass. Against the back of this mirror the speaker's voice is directed. The light reflected from this mirror is thus thrown into vibration corresponding to those of the diaphragm itself. In arranging the apparatus for the purpose of reproducing sound at a distance any powerful source of light may be used, but we have experimented chiefly with sunlight. For this purpose a large beam is concentrated by means of a lens upon the diaphragm mirror, and after reflection is again rendered parallel by means of another lens. The beam is received at a distant station upon a parabolic reflector, in the focus of which is placed a sensitive selenium cell, connected in a local circuit with a battery and telephone." The loudest effects obtained from light were produced by rapidly interrupting the beam by a perforated rotating disk, revolving over the face of another perforated disk, with holes corresponding. Audible musical tones were produced from the light of a candle.

The experiments connected with the construction of this apparatus led to others with other substances than selenium, and also without the use of telephone or battery. A thin sheet of hard rubber was held close to the ear while a beam of intermittent light was thrown upon it by a lens, the result being the production of a musical note, and this

effect was intensified by arranging the hard rubber as a diaphragm and listening through a hearing-tube. The remarkable though natural conclusion was reached "*that sounds can be produced by the action of a variable light from substances of all kinds when in the form of thin diaphragms.*" Subsequently prof. Bell arrived at the conclusion that *sonorousness under the influence of intermittent light is a property of all matter.* Various experiments were made with different fibrous and porous materials, such as cotton-wool, worsted, silks, sponge, lamp-black, etc. These articles were inclosed in a conical cavity, contained in a piece of brass, and closed by a flat plate of glass through which an intermittent beam of light was thrown upon them. A hearing-tube communicated with the cavity. Mr. Tainter found that the darkest shades produced the best effects. Black worsted especially gave an extremely loud sound. Cotton-wool darkened with lamp-black gave so loud a sound as to suggest the use of lamp-black alone. Of this substance a teaspoonful, placed in a test-tube and exposed to an intermittent beam of sunlight produced the loudest sound of all, and a piece of smoked glass, with the smoked surface receiving the intermittent beam, gave a fine effect. Upon smoking the interior of the conical cavity of the receiver above-mentioned, and then exposing it to the intermittent beam, "the effect was perfectly startling. The sound was so loud as to be actually painful to the ear placed closely against the end of the hearing-tube." The various experiments above alluded to will probably be of great importance in telephony as indicating that lamp-black may be substituted for selenium in an electrical receiver. M. Mercadier passed an intermittent beam from an electric lamp through a prism and found a difference in the audible effects in different parts of the spectrum. These experiments were repeated by prof. Bell, with somewhat different results. Under conditions not necessary to describe here, "sounds were obtained in every part of the visible spectrum excepting the extreme half of the violet, as well as in the ultra-red. A continuous increase in the loudness of the sound was observed upon moving the receiver gradually from the violet into the ultra-red. The point of maximum sound lay very far out in the ultra-red. Beyond this point the sound began to decrease, and then stopped so suddenly that a very slight motion of the receiver made all the difference between almost maximum sound and complete silence." Removing the smoked wire gauze from the receiver and substituting red worsted different results were obtained, the maximum effect being produced in the green at that part where the red worsted appeared to be black. On either side of this point the sound gradually died away. On substituting green silk for the red worsted the maximum effects were found in the red. A test tube containing the vapor of sulphuric ether was then substituted for the receiver, but no effects were observed till a certain point far out in the ultra-red was reached, when a musical tone was suddenly produced, which disappeared as suddenly further on. With the vapor of iodine the maximum effect was in the green. These, and experiments with other substances, led to the conclusion that "the nature of the rays that produce sonorous effects in different substances depends upon the nature of the substances that are exposed to the beam, and that the sounds are in every case due to those rays of the spectrum that are absorbed by the body." These phenomena led prof. Bell to the construction of a new instrument for use in spectrum analysis, which was described and exhibited to the philosophical society of Washington last April. "The eye-piece of a spectroscope is removed and sensitive substances are placed in the focal point of the instrument behind an opaque diaphragm containing a slit. These substances are put in communication with the ear by means of a hearing-tube, and thus the instrument is converted into a veritable 'spectrophone.' Suppose we smoke the interior of our spectrophonic receiver and fill the cavity with peroxide of nitrogen gas. We have then a combination that gives us good sounds in all parts of the spectrum, visible and invisible, except the ultra-violet. Now pass a rapidly interrupted beam of light through some substance whose absorption spectrum is to be investigated, and bands of sound and silence are observed upon exploring the spectrum, the silent positions corresponding to the absorption bands. Of course the ear cannot for one moment compete with the eye in the examination of the visible part of the spectrum; but in the invisible part beyond the red, where the eye is useless, the ear is invaluable. In working in this region of the spectrum, lamp-black alone may be used in the spectrophonic receiver. Indeed, the sounds produced by this substance in the ultra-red are so well marked as to constitute our instrument a most reliable and convenient substitute for the thermo-pile." See *Science* for May 28, 1881. Prof. Bell recognizes the fact that the spectrophone must always be no more than an adjunct to the spectroscope, but believes that it will have a wide and independent field of usefulness in the investigation of absorption spectra in the ultra-red.

SPECTROSCOPE, the instrument by the aid of which spectral phenomena (see **SPECTRUM**) may be most conveniently studied. It consists essentially of, first, an illuminated slit, from which parallel rays of light proceed; secondly, a prism or train of prisms, to separate the differently refrangible rays; and thirdly, a telescope, to view a magnified image of the spectrum produced. See **SUN**.

SPECTRUM (Gr.) is a term applied in optics to the colored image of the sun or other luminous body, produced by refraction through a prism (q.v.), by diffraction (q.v.) through a fine grating, etc. In what follows we shall confine ourselves to the spectrum produced by a prism, as that which is commonly used. Besides, so far as we have at

present occasion to examine it, it presents very nearly the same appearance as spectra produced by other processes.

The solar spectrum was first carefully examined by Newton, who deduced from his observations the composite nature of white light, and the different refrangibilities of its various colored constituents. A ray of sunlight enters a darkened room through a small hole, in a shutter. It proceeds in a straight line to the opposite wall, and forms as a circular white spot, an image of the sun. If the edge of a glass prism be interposed in the path of this ray, the white spot disappears, and the spectrum is produced. In this form of experiment, its shape is that of a rectangle with semicircular ends.

The breadth of the spectrum is equal to the diameter of the spot; and it is brilliantly colored, the one end being red, and the other end violet. Between these we have gradations of color, and the whole appeared to Newton to be divisible into seven differently colored spaces, which he called red, orange, yellow, green, blue, indigo, violet. This was in accordance with the speculations of old days, when analogies were constantly looked for, and seems to have been suggested to Newton by the common musical scale. It is impossible, however, to settle precisely the exact boundary between any two of these fancied species of color; and, besides, such a description of the spectrum (though complete enough for mere popular language) is totally inadequate to express our present knowledge of the subject. In order to study the spectrum a little more closely, suppose we have pieces of colored glass which allow only one definite color to pass. With a red glass placed at the hole in the shutter, the prism being removed, the effect would be to render the spot red, without changing its position. Introduce the prism, and the effect is to change the position of the spot without altering its size or color.

Similarly, with a violet glass we have a violet spot, and so on; the change of position, due to refraction, being least for red and greatest for violet. It thus appears that the spectrum formed in this way, is made up of a series of circular spots, of the various colors of which white light consists all of the same size, and having their centers ranged along a line, so that each overlaps those next it. The only parts of the spectrum which are *pure*, i.e., where no two or more colors are mixed, are the ends; so that, by this process, it is impossible to separate definitely the rays of different refrangibility, so as to see, for instance, *whether any are wanting*. How, then, are we to ascertain whether sunlight contains rays of every refrangibility from red to violet? The obvious method is to make the spot not circular, but long and very narrow, a process mentioned by Newton himself. To make this spot thus narrow, a method commonly employed, is to set the prism about half-way between the shutter and the screen and to place before it a lens, such that, if the prism were removed, there would be an image of the hole in the shutter nearly equal to it in size. The hole must, therefore, be a narrow slit, parallel to the edge of the prism. When this arrangement is adjusted we have a pure spectrum, and we find it to be (at first sight) *continuous*. Thus, it appears that sunlight contains rays of every refrangibility, from the highest to the lowest; and that Newton's sevenfold division of it, though sometimes convenient for popular reference, has no scientific basis. Besides, what we can see is not the whole spectrum but a mere fraction of it; for beyond the red end, there are invisible rays recognized at once by their heating powers; and beyond the violet, there are invisible rays more powerful than the visible in producing chemical changes, as on a photographic plate, and which can be changed into visible rays by fluorescent substances. See PHOSPHORESCENCE. The breadth of the visible spectrum evidently depends on the *length* of the slit, its length on the difference of refrangibility of red and violet.

If we cut a narrow slit in the screen on which the spectrum falls, in a direction perpendicular to its length, the light which passes through has a definite refrangibility, and can no longer be drawn out by a prism into a spectrum. This experiment also is due to Newton.

If the slit in the shutter be very narrow, and the prism be adjusted to the most favorable position (so that the incident and refracted rays make equal angles with the surfaces on which they impinge, and from which they escape, respectively), we see that after all the solar spectrum is *not* continuous. It is found to be crossed at intervals by dark bands, showing the absence of rays of certain definite refrangibilities. The phenomenon is found to be the same whatever be the substance of the prism; so that these rays are really wanting in sunlight.

This important discovery was made by Wollaston, but the bands were first carefully observed and measured by Fraunhofer, from whom they are commonly called *Fraunhofer's lines*. We owe to Fraunhofer the invaluable suggestion of employing a telescope to examine the spectrum. The refracted rays are received directly on the object-glass of the telescope, which forms an image of the spectrum to be examined with the aid of the eye-piece, the screen being dispensed with. Wollaston had seen only five lines; Fraunhofer at once discovered four hundred; Brewster, with more perfect apparatus, counted two thousand; and now, with a train of prisms, and powerful telescopes, their number seems beyond computation. They show every variety of breadth and distinctness, and are grouped in the most irregular manner. For reference, Fraunhofer selected some of the more prominent, to which he attached the earlier letters of the alphabet. By their help he was enabled to measure refractory indices (see REFRACTION) with a precision

completely unlooked for. If the light of a candle, a bright gas-flame, a white hot wire, or a lime-ball in the oxyhydrogen flame, he examined in the same way, *no such lines are seen*. But some of them, and others not apparently belonging to sunlight, were found by Fraunhofer in the spectra of various fixed stars—while the light of the moon and planets seemed to give spectra similar to that of sunlight.

The first to throw any light on this subject was Brewster. He showed that when light passed through nitrous acid gas its spectrum was interrupted by countless lines; and that they increased in number and breadth by the application of heat to the gas, so that at a high temperature a thin layer of this gas is *opaque to direct sunlight*. Hence it was natural to conclude that the dark bands in the solar spectrum are caused by absorption in some medium lying between us and the sun. It is to be observed, however, that this is on the supposition that light as it comes immediately from the sun would give, like that of the lime ball, a continuous spectrum. But Brewster went further. He showed that *some* of Fraunhofer's lines depend on the altitude of the sun, that is, on the greater or less space of air, fog, and vapor through which his rays must pass before reaching the earth. *Some of them, then, are caused by absorption in the earth's atmosphere.*

But we must now look to another class of phenomena. A spirit lamp flame gives a very feeble spectrum; and, if a little common salt be put on the wick, although the flame becomes instantly very much brighter, no alteration is produced on the spectrum, save the appearance of a *bright yellow line*, crossing it at the place where the dark line called by Fraunhofer D appears in sunlight. On examining this line carefully Fraunhofer found that it, like D, is double—and he verified that these two rays were exactly (so far as refractive index goes) two of those wanting in sunlight, and in the light of some of the stars.

About the same time Talbot and Herschel (q.v.) showed that the colors given by Lithia, Strontia, etc., in a spirit flame were, like that produced by common salt, due to the production of light of several perfectly definite refrangibilities; so that the spectrum of the lamp-flame was crossed in each case by a series of bright lines always the same when the same body was placed in the flame; and they suggested (in 1825) the application of this method to the qualitative analysis of minerals, etc., when the presence of extremely minute quantities of different bodies has to be ascertained. This was, in reality, the foundation of SPECTRUM ANALYSIS; and the method was, we may say, almost complete so far as practice is concerned. The theory, however, was left incomplete, so far as regards the cause of dark lines in the solar spectrum. Foucault (in 1849) seems to have been the first to approach the true explanation. An experiment of his, from which, however, he drew no inferences, contains the complete theory. When salt is placed in the voltaic arc (Electric Light, q.v.) the spectrum gives the double bright line (coinciding with the double dark line D) already referred to. When sunlight passes through this arc its dark line D is *strengthened*, instead of being filled up by the yellow light from the arc as we might have expected; and when one of the white-hot carbon-points (which gives a continuous spectrum) is looked at through the yellow arc, the double dark line D appears in its spectrum.

Stokes learning, in 1850, that experiments had been made by professor Miller of Cambridge, to test with great accuracy Fraunhofer's assertion as to the exact coincidence of the double bright line of a salted flame with the double dark line of the solar spectrum, gave for the first time the physical explanation of the phenomenon. He compared the salt-flame to a space full of tuning-forks or piano-forte wires all tuned to the same note. When they are in vibration they, of course, give out this note—similarly the salt-flame the *bright* lines. When, however, sounds are produced in their neighborhood, as they naturally vibrate to one definite note, they will be set in vibration by it (i.e., will absorb it) if it be part of the sound.—Thus sound which has passed through such a space has had this note eliminated from it—similarly the salt flame seizes these yellow rays from white light passing through it. This ingenious and satisfactory explanation shows at once that the line D proves the existence of salt (or sodium) in the atmosphere of the sun. Stokes's theory was not published, except in so far as it was annually given by sir W. Thompson (q.v.) in his lectures in Glasgow—so that it was independently discovered, or all but discovered, by various other philosophers some 8 or 10 years later. The earliest of these was Balfour Stewart of the Kew observatory, who proved by reasoning and experiment that a body's absorbing power for any ray of light or heat is equal to its radiating power for the same. Angström all but made the rediscovery. Finally Kirchhoff, by reasoning similar to that of Stewart, and by actually reversing the spectra of certain substances, arrived at the same results; and, in conjunction with Bunsen, applied them to chemical analysis, with the immediate result of discovering two new metals.

One of the most valuable parts of Kirchhoff's investigation is his map of the solar spectrum with its dark lines; side by side with which is a spectrum containing the bright lines given by various metals volatilized in an electric spark. The sunlight is admitted through the upper half of the slit, the light from the burning metal through the lower—and thus the two are subject to precisely the same deflections by the train of prisms.

The applications of the spectrum analysis are becoming more numerous every day. Huggins has lately shown that the spectra of planetary nebulae, and of the tails of

comets, consist of a few *bright* lines only—indicating that these bodies—or, at all events, those portions of them from which their light proceeds—are masses of incandescent vapors or gases.

Again, Stokes has traced, by the alteration of the absorption bands produced by the coloring matter of blood, the oxidation and reduction which constantly take place in this substance, and its connection with the distinction between venous and arterial blood.

SPECULUM METAL, an alloy of copper and tin, used for making the reflecting surfaces of reflecting telescopes. The best consists of 126.4 parts copper to 58.9 tin. To obtain a perfect alloy, and to cast it successfully, is a matter of great difficulty, requiring much skill and experience. See **TELESCOPE**.

SPEEDWELL, *Veronica*, a genus of plants of the natural order *scrophulariaceæ*, distinguished by a 4-cleft wheel-shaped corolla, with the lower segment narrower, two stamens, and a two-celled capsule. The species are very numerous, annual and perennial herbaceous plants and small shrubs, natives of temperate and cold climates in all parts of the globe. Some of them grow in wet ditches and in marshes, some only on the driest soils. They have generally very beautiful blue, white, or pink flowers. The number of British species is considerable, and few wild-flowers are more beautiful than the germander speedwell (*V. chamaedrys*), or the alpine species, *V. alpina* and *V. saxatilis*. A number of species are very generally cultivated in flower-gardens.—The bitter and astringent leaves of the COMMON SPEEDWELL (*V. officinalis*), one of the most abundant British species, found also in almost all the northern parts of the world, are in some countries used as a tonic, sudorific, diuretic, and expectorant medicine. They are also employed, particularly in Sweden, as a substitute for tea; as are those of the germander speedwell.—*V. virginica* is called *Calver's physic* in North America; it is said to be actively diuretic, and a decoction of the fresh root is violently cathartic and emetic.—Brooklime (*q. v.*) belongs to this genus.

SPEISS, a residue found in the bottoms of crucibles in which smalts or cobalt glass has been melted. It consists of nickel, arsenic, sulphur, with traces of cobalt, copper, and antimony.
